$f = 10\text{ kHz}$	50	50	50	50	50	50	nV/ $\sqrt{\text{Hz}}$ typ	
$f = 100\text{ kHz}$	50	50	50	50	50	50	nV/ $\sqrt{\text{Hz}}$ typ	

### NOTES

<sup>1</sup>Temperature ranges are as follows: J, K Versions:  $0^{\circ}\text{C}$  to  $+70^{\circ}\text{C}$ ; A, B Versions:  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ ; S, T Versions:  $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

<sup>2</sup>Guaranteed by design and characterization, not production tested.

<sup>3</sup>The metal lid on the ceramic D-24A package is connected to Pin 12 (DGND).

<sup>4</sup>The device is functional with a power supply of  $\pm 12\text{ V}$ .

<sup>5</sup>Minimum specified load resistance is  $2\text{ k}\Omega$ .

Specifications subject to change without notice.

# TIMING CHARACTERISTICS<sup>1</sup> ( $V_{DD} = +15\text{ V}, \pm 5\%$ . $V_{SS} = -15\text{ V}, \pm 5\%$ . $V_{REF} = +10\text{ V}$ . $AGND = DGND = 0\text{ V}$ .)

Parameter	Limit at $T_{MIN}$ to $T_{MAX}$ (All Versions)	Units	Test Conditions/Comments
$t_{CS}$	30	ns min	Chip Select to Write Setup Time
$t_{CH}$	0	ns min	Chip Select to Write Hold Time
$t_{WR}$	30	ns min	Write Pulsewidth
$t_{DS}$	80	ns min	Data Setup Time
$t_{DH}$	0	ns min	Data Hold Time

## NOTES

<sup>1</sup>Guaranteed by design and characterization, not production tested.

Specifications subject to change without notice.

## ABSOLUTE MAXIMUM RATINGS<sup>1</sup>

( $T_A = +25^\circ\text{C}$  unless otherwise stated)

$V_{DD}$  to DGND .....  $-0.3\text{ V}$  to  $+17\text{ V}$

$V_{SS}$  to DGND .....  $+0.3\text{ V}$  to  $-17\text{ V}$

$V_{REF}$  to AGND .....  $V_{DD} + 0.3\text{ V}$ ,  $V_{SS} - 0.3\text{ V}$

$V_{RFB}$  to AGND .....  $V_{DD} + 0.3\text{ V}$ ,  $V_{SS} - 0.3\text{ V}$

$V_{RA}$  to AGND .....  $V_{DD} + 0.3\text{ V}$ ,  $V_{SS} - 0.3\text{ V}$

$V_{RB}$  to AGND .....  $V_{DD} + 0.3\text{ V}$ ,  $V_{SS} - 0.3\text{ V}$

$V_{RC}$  to AGND .....  $V_{DD} + 0.3\text{ V}$ ,  $V_{SS} - 0.3\text{ V}$

$V_{OUT}$  to AGND<sup>2</sup> .....  $V_{DD} + 0.3\text{ V}$ ,  $V_{SS} - 0.3\text{ V}$

AGND to DGND .....  $-0.3\text{ V}$ ,  $V_{DD}$

Digital Input Voltage to DGND .....  $-0.3\text{ V}$  to  $V_{DD} + 0.3\text{ V}$

Power Dissipation (Any Package)

To  $+75^\circ\text{C}$  .....  $650\text{ mW}$

Derates above  $+75^\circ\text{C}$  .....  $10\text{ mW}/^\circ\text{C}$

## Operating Temperature Range

Commercial (J, K Versions) .....  $0^\circ\text{C}$  to  $+70^\circ\text{C}$

Industrial (A, B Versions) .....  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$

Extended (S, T Versions) .....  $-55^\circ\text{C}$  to  $+125^\circ\text{C}$

Storage Temperature Range .....  $-65^\circ\text{C}$  to  $+150^\circ\text{C}$

Lead Temperature (Soldering, 10 sec) .....  $+300^\circ\text{C}$

## NOTES

<sup>1</sup>Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect device reliability. Only one Absolute Maximum Rating may be applied at any one time.

<sup>2</sup> $V_{OUT}$  may be shorted to AGND provided that the power dissipation of the package is not exceeded.

## CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as  $4000\text{ V}$  readily accumulate on the human body and test equipment and can discharge without detection. Although the AD7845 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## ORDERING GUIDE<sup>1</sup>

Model <sup>2</sup>	Temperature Range	Relative Accuracy @ $+25^\circ\text{C}$	Package Option <sup>3</sup>
AD7845JN	$0^\circ\text{C}$ to $+70^\circ\text{C}$	$\pm 1\text{ LSB}$	N-24
AD7845KN	$0^\circ\text{C}$ to $+70^\circ\text{C}$	$\pm 1/2\text{ LSB}$	N-24
AD7845JP	$0^\circ\text{C}$ to $+70^\circ\text{C}$	$\pm 1\text{ LSB}$	P-28A
AD7845KP	$0^\circ\text{C}$ to $+70^\circ\text{C}$	$\pm 1/2\text{ LSB}$	P-28A

AD7845KR	$0^\circ\text{C}$ to $+70^\circ\text{C}$	$\pm 1/2\text{ LSB}$	R-24
AD7845AQ	$-40^\circ\text{C}$ to $+85^\circ\text{C}$	$\pm 1\text{ LSB}$	Q-24
AD7845BQ	$-40^\circ\text{C}$ to $+85^\circ\text{C}$	$\pm 1/2\text{ LSB}$	Q-24
AD7845AR	$-40^\circ\text{C}$ to $+85^\circ\text{C}$	$\pm 1\text{ LSB}$	R-24
AD7845BR	$-40^\circ\text{C}$ to $+85^\circ\text{C}$	$\pm 1/2\text{ LSB}$	R-24
AD7845SQ/883B	$-55^\circ\text{C}$ to $+125^\circ\text{C}$	$\pm 1\text{ LSB}$	Q-24
AD7845TQ/883B	$-55^\circ\text{C}$ to $+125^\circ\text{C}$	$\pm 1/2\text{ LSB}$	Q-24
AD7845SE/883B	$-55^\circ\text{C}$ to $+125^\circ\text{C}$	$\pm 1\text{ LSB}$	E-28A

## NOTES

<sup>1</sup>Analog Devices reserves the right to ship either ceramic (D-24A) or cerdip (Q-24) hermetic packages.

<sup>2</sup>To order MIL-STD-883, Class B processed parts, add /883B to part number.

<sup>3</sup>E = Leadless Ceramic Chip Carrier; N = Plastic DIP; P = Plastic Leaded Chip Carrier; Q = Cerdip; R = SOIC.

Figure 1. AD7845 Timing Diagram

## PIN CONFIGURATIONS

## TERMINOLOGY

### LEAST SIGNIFICANT BIT

This is the analog weighting of 1 bit of the digital word in a DAC. For the AD7845, 1 LSB =  $\frac{V_{REF}}{2^{12}}$ .

### RELATIVE ACCURACY

Relative accuracy or endpoint nonlinearity is a measure of the maximum deviation from a straight line passing through the endpoints of the DAC transfer function. It is measured after adjusting for both endpoints (i.e., offset and gain error are adjusted out) and is normally expressed in least significant bits or as a percentage of full-scale range.

### DIFFERENTIAL NONLINEARITY

Differential nonlinearity is the difference between the measured change and the ideal 1 LSB change between any two adjacent codes. A specified differential nonlinearity of +1 LSB max over the operating temperature range ensures monotonicity.

### GAIN ERROR

Gain error is a measure of the output error between an ideal DAC and the actual device output with all 1s loaded after offset error has been adjusted out. Gain error is adjustable to zero with an external potentiometer. See Figure 13.

### ZERO CODE OFFSET ERROR

This is the error present at the device output with all 0s loaded in the DAC. It is due to the op amp input offset voltage and bias current and the DAC leakage current.

### TOTAL HARMONIC DISTORTION

This is the ratio of the root-mean-square (rms) sum of the harmonics to the fundamental, expressed in dBs.

### OUTPUT NOISE

This is the noise due to the white noise of the DAC and the input noise of the amplifier.

### DIGITAL-TO-ANALOG GLITCH IMPULSE

This is the amount of charge injected from the digital inputs to the analog output when the inputs change state. This is normally specified as the area of the glitch in either pA-secs or nV-secs depending upon whether the glitch is measured as a current or voltage. The measurement takes place with  $V_{REF} = AGND$ .

### DIGITAL FEEDTHROUGH

When the DAC is not selected (i.e.,  $\overline{CS}$  is high) high frequency logic activity on the device digital inputs is capacitively coupled through the device to show up as noise on the  $V_{OUT}$  pin. This noise is digital feedthrough.

### MULTIPLYING FEEDTHROUGH ERROR

This is an error due to capacitive feedthrough from the  $V_{REF}$  terminal to  $V_{OUT}$  when the DAC is loaded with all 0s.

### OPEN-LOOP GAIN

Open-loop gain is defined as the ratio of a change of output voltage to the voltage applied at the  $V_{REF}$  pin with all 1s loaded in the DAC. It is specified at dc.

### UNITY GAIN SMALL SIGNAL BANDWIDTH

This is the frequency at which the magnitude of the small signal voltage gain of the output amplifier is 3 dB below unity. The device is operated as a closed-loop unity gain inverter (i.e., DAC is loaded with all 1s).

### OUTPUT RESISTANCE

This is the effective output source resistance.

### FULL POWER BANDWIDTH

Full power bandwidth is specified as the maximum frequency, at unity closed-loop gain, for which a sinusoidal input signal will produce full output at rated load without exceeding a distortion level of 3%.

## PIN FUNCTION DESCRIPTION (DIP)

Pin	Mnemonic	Description
1	$V_{OUT}$	Voltage Output Terminal
2-11	DB11-DB2	Data Bit 11 (MSB) to Data Bit 2
12	DGND	Digital Ground. The metal lid on the ceramic package is connected to this pin
13-14	DB1-DB0	Data Bit 1 to Data Bit 0 (LSB)
15	$\overline{WR}$	Write Input. Active low
16	$\overline{CS}$	Chip Select Input. Active low
17	$V_{REF}$	Reference Input Voltage which can be an ac or dc signal
18	AGND	Analog Ground. This is the reference point for external analog circuitry
19	$V_{SS}$	Negative power supply for the output amplifier (nominal -12 V to +15 V)
20	$V_{DD}$	Positive power supply (nominal +12 V to +15 V)
21	$R_A$	Application resistor. $R_A = 4 R_{FB}$
22	$R_B$	Application resistor. $R_B = 2 R_{FB}$
23	$R_C$	Application resistor. $R_C = 2 R_{FB}$
24	$R_{FB}$	Feedback resistor in the DAC. For normal operation this is connected to $V_{OUT}$

## CIRCUIT INFORMATION

### Digital Section

Figure 11 is a simplified circuit diagram of the AD7845 input control logic. When  $\overline{CS}$  and  $\overline{WR}$  are both low, the DAC latch is loaded with the data on the data inputs. All the digital inputs are TTL, HCMOS and +5 V CMOS compatible, facilitating easy microprocessor interfacing. All digital inputs incorporate standard protection circuitry.

Figure 11. AD7845 Input Control Logic

### D/A Section

Figure 12 shows a simplified circuit diagram for the AD7845 D/A section and output amplifier.

A segmented scheme is used whereby the 2 MSBs of the 12-bit data word are decoded to drive the three switches A-C. The remaining 10 bits drive the switches (S0-S9) in a standard R-2R ladder configuration.

Each of the switches A-C steers 1/4 of the total reference current with the remaining 1/4 passing through the R-2R section.

An output amplifier and feedback resistor perform the current-to-voltage conversion giving

$$V_{OUT} = -D \times V_{REF}$$

where  $D$  is the fractional representation of the digital word. ( $D$  can be set from 0 to 4095/4096.)

The amplifier can maintain  $\pm 10$  V across a 2 k $\Omega$  load. It is internally compensated and settles to 0.01% FSR (1/2 LSB) in less than 5  $\mu$ s. The input offset voltage is laser trimmed at wafer level. The amplifier slew rate is typically 11 V/ $\mu$ s, and the unity gain small signal bandwidth is 600 kHz. There are three extra on-chip resistors ( $R_A$ ,  $R_B$ ,  $R_C$ ) connected to the amplifier inverting terminal. These are useful in a number of applications including offset adjustment and gain ranging.

Figure 12. Simplified Circuit Diagram for the AD7845 D/A Section

### UNIPOLAR BINARY OPERATION

Figure 13 shows the AD7845 connected for unipolar binary operation. When  $V_{IN}$  is an ac signal, the circuit performs 2-quadrant multiplication. The code table for Figure 13 is given in Table I.

Figure 13. Unipolar Binary Operation

Table I. Unipolar Binary Code Table for AD7845

Binary Number In DAC Register			Analog Output, $V_{OUT}$
MSB		LSB	
1111	1111	1111	$-V_{IN} \left( \frac{4095}{4096} \right)$
1000	0000	0000	$-V_{IN} \left( \frac{2048}{4096} \right) = -1/2 V_{IN}$
0000	0000	0001	$-V_{IN} \left( \frac{1}{4096} \right)$
0000	0000	0000	0 V

### OFFSET AND GAIN ADJUSTMENT FOR FIGURE 13

#### Zero Offset Adjustment

1. Load DAC with all 0s.
2. Trim R3 until  $V_{OUT} = 0$  V.

#### Gain Adjustment

1. Load DAC with all 1s.
2. Trim R1 so that  $V_{OUT} = -V_{IN} \frac{4095}{4096}$ .

In fixed reference applications, full scale can also be adjusted by omitting R1 and R2 and trimming the reference voltage magnitude. For high temperature applications, resistors and potentiometers should have a low temperature coefficient.

### BIPOLAR OPERATION

#### (4-QUADRANT MULTIPLICATION)

The recommended circuit for bipolar operation is shown in Figure 14. Offset binary coding is used.

The offset specification of this circuit is determined by the matching of internal resistors  $R_B$  and  $R_C$  and by the zero code offset error of the device. Gain error may be adjusted by varying the ratio of R1 and R2.

To use this circuit without trimming and keep within the gain error specifications, resistors R1 and R2 should be ratio matched to 0.01%.

The code table for Figure 14 is given in Table II.

Figure 14. Bipolar Offset Binary Operation

Table II. Bipolar Code Table for Offset Binary Circuit of Figure 14

Binary Number In DAC Register			Analog Output, $V_{OUT}$
MSB		LSB	
1111	1111	1111	$+V_{IN} \left( \frac{2047}{2048} \right)$
1000	0000	0001	$+V_{IN} \left( \frac{1}{2048} \right)$
1000	0000	0000	0 V
0111	1111	1111	$-V_{IN} \left( \frac{1}{2048} \right)$
0000	0000	0000	$-V_{IN} \left( \frac{2048}{2048} \right) = -V_{IN}$

Figure 18. 4–20 mA Current Loop

## APPLICATION HINTS

**General Ground Management:** AC or transient voltages between AGND and DGND can cause noise injection into the analog output. The simplest method of ensuring that voltages at AGND and DGND are equal is to tie AGND and DGND together at the AD7845. In more complex systems where the AGND and DGND intertie is on the backplane, it is recommended that two diodes be connected in inverse parallel between the AD7845 AGND and DGND pins (IN914 or equivalent).

**Digital Glitches:** When a new digital word is written into the DAC, it results in a change of voltage applied to some of the DAC switch gates. This voltage change is coupled across the switch stray capacitance and appears as an impulse on the current output bus of the DAC. In the AD7845, impulses on this bus are converted to a voltage by  $R_{FB}$  and the output amplifier. The output voltage glitch energy is specified as the area of the resulting spike in nV-seconds. It is measured with  $V_{REF}$  connected to analog ground and for a zero to full-scale input code transition. Since microprocessor based systems generally have noisy grounds which couple into the power supplies, the AD7845  $V_{DD}$  and  $V_{SS}$  terminals should be decoupled to signal ground.

**Temperature Coefficients:** The gain temperature coefficient of the AD7845 has a maximum value of 5 ppm/°C. This corresponds to worst case gain shift of 2 LSBs over a 100°C temperature range. When trim resistors R1 and R2 in Figure 13 are used to adjust full-scale range, the temperature coefficient of R1 and R2 must be taken into account. The offset temperature coefficient is 5 ppm of FSR/°C maximum. This corresponds to a worst case offset shift of 2 LSBs over a 100°C temperature range.

# AD7845

## MICROPROCESSOR INTERFACING 16-BIT MICROPROCESSOR SYSTEMS

Figures 19, 20 and 21 show how the AD7845 interfaces to three popular 16-bit microprocessor systems. These are the MC68000, 8086 and the TMS32010. The AD7845 is treated as a memory-mapped peripheral to the processors. In each case, a write instruction loads the AD7845 with the appropriate data. The particular instructions used are as follows:

MC68000: MOVE  
8086: MOV  
TMS32010: OUT

## 8-BIT MICROPROCESSOR SYSTEMS

Figure 22 shows an interface circuit for the AD7845 to the 8085A 8-bit microprocessor. The software routine to load data to the device is given in Table IV. Note that the transfer of the 12 bits of data requires two write operations. The first of these loads the 4 MSBs into the 7475 latch. The second write operation loads the 8 LSBs plus the 4 MSBs (which are held by the latch) into the DAC.

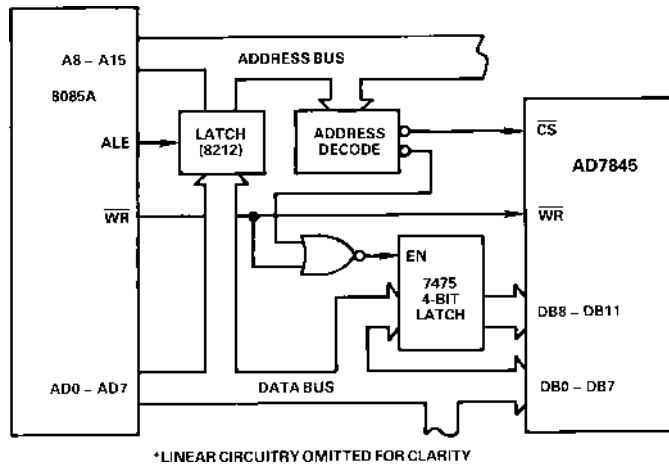

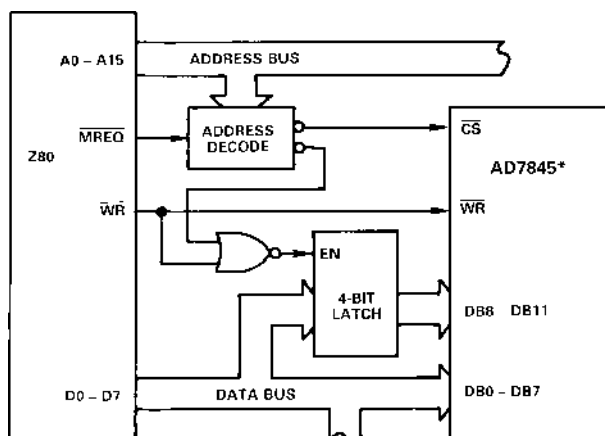

Figure 22. 8085A Interface

Table IV. Subroutine Listing for Figure 22

2000	LOAD DAC: LXI	H,#3000	The H,L register pair are loaded with latch address 3000.
	MVI	A,#"MS"	Load the 4 MSBs of data into accumulator.
	MOV	M,A	Transfer data from accumulator to latch.
	INR	L	Increment H,L pair to AD7845 address.
	MVI	A,#"LS"	Load the 8 LSBs of data into accumulator.
	MOV	M,A	Transfer data from accumulator to DAC.
	RET		End of routine.

Figure 23 and 24 are the interface circuits for the Z80 and MC6809 microprocessors. Again, these use the same basic format as the 8085A interface.

## DIGITAL FEEDTHROUGH

In the preceding interface configurations, most digital inputs to the AD7845 are directly connected to the microprocessor bus. Even when the device is not selected, these inputs will be constantly changing. The high frequency logic activity on the bus can feed through the DAC package capacitance to show up as noise on the analog output. To minimize this digital feedthrough isolate the DAC from the noise source. Figure 25 shows an interface circuit which uses this technique. All data inputs are latched from the bus by the  $\overline{CS}$  signal. One may also use other means, such as peripheral interface devices, to reduce the digital feedthrough.
