Operating Characteristics

- Voltage range: 1.71 to 3.6 V
- Flash write voltage range: 1.71 to 3.6 V
- Temperature range: –40 to 105 °C

Packages

- 64 LQFP 10mm x 10mm, 0.5mm pitch, 1.6mm thickness
- 36 XFBGA 3.5mm x 3.5mm, 0.5mm pitch, 0.5mm thickness
- 32 QFN 5mm x 5mm, 0.5mm pitch, 0.65mm thickness
- 64 MAPBGA 5mm x 5mm, 0.5mm pitch, 1.23mm thickness (Package Your Way)
- 48 QFN 7mm x 7mm, 0.5mm pitch, 0.65mm thickness (Package Your Way)

Security and Integrity

- 80-bit unique identification number per chip
- Advanced flash security
- Hardware CRC module

I/O

- Up to 54 general-purpose input/output pins

Low Power

- Down to 46 µA/MHz in very low power run mode
- Down to 1.68 µA in stop mode (RAM + RTC retained)
- Six flexible static modes

NOTE

2 Overview

The following figure shows the system diagram of this device

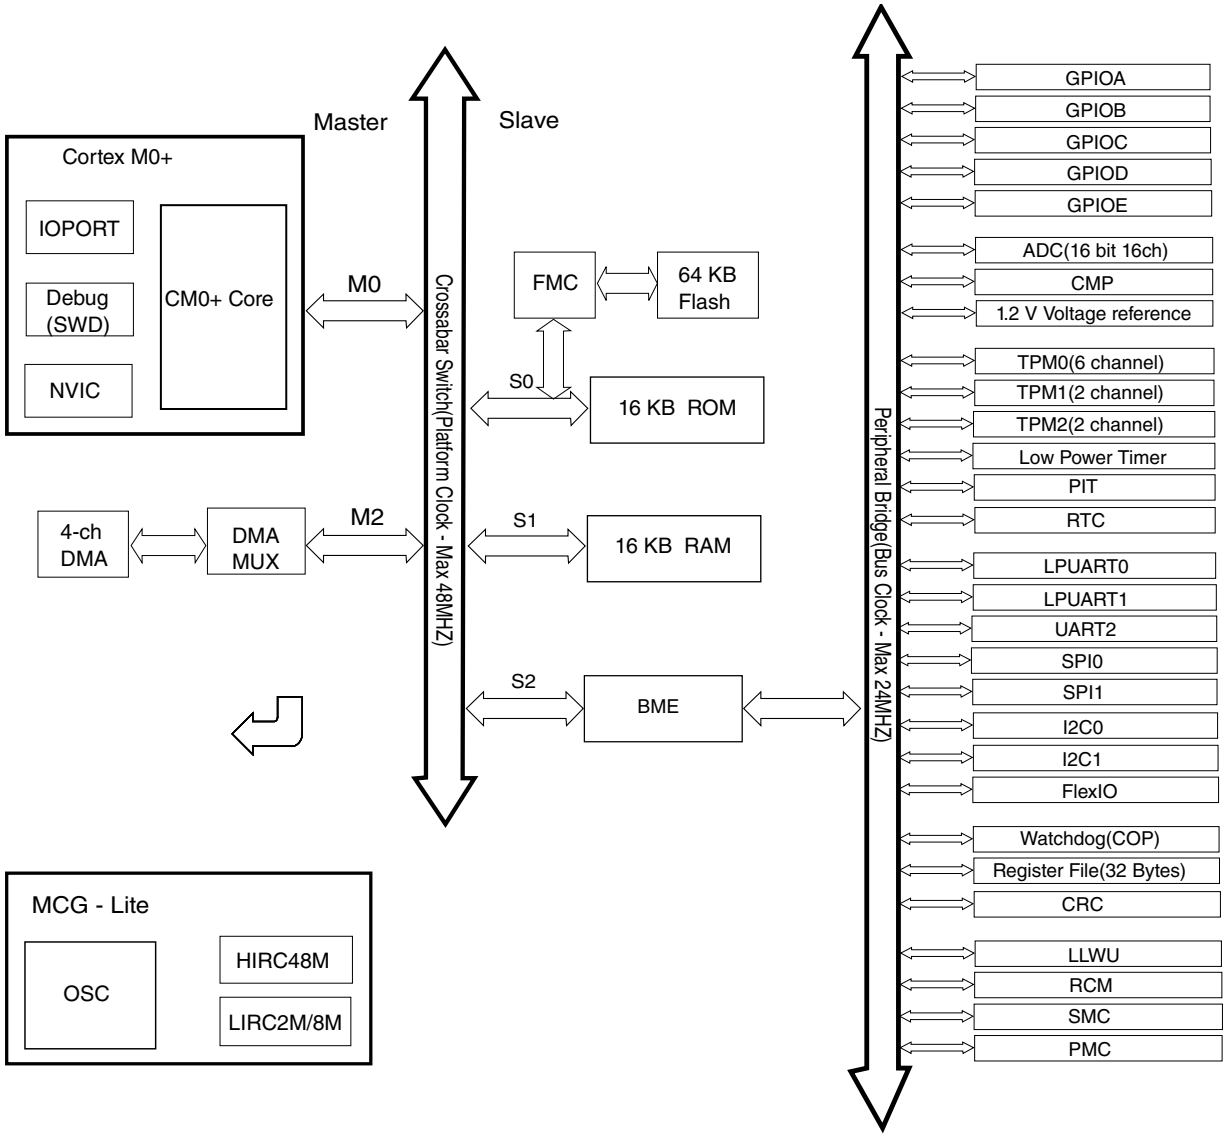

Figure 1. System diagram

The crossbar switch connects bus masters and slaves using a crossbar switch structure. This structure allows up to four bus masters to access different bus slaves simultaneously, while providing arbitration among the bus masters when they access the same slave.

2.1 System features

The following sections describe the high-level system features.

2.1.1 ARM Cortex-M0+ core

The enhanced ARM Cortex M0+ is the member of the Cortex-M series of processors targeting microcontroller cores focused on very cost sensitive, low power applications. It has a single 32-bit AMBA AHB-Lite interface and includes an NVIC component. It also has hardware debug functionality including support for simple program trace capability. The processor supports the ARMv6-M instruction set (Thumb) architecture including all but three 16-bit Thumb opcodes (52 total) plus seven 32-bit instructions. It is upward compatible with other Cortex-M profile processors.

2.1.2 NVIC

The Nested Vectored Interrupt Controller supports nested interrupts and 4 priority levels for interrupts. In the NVIC, each source in the IPR registers contains two bits. It also differs in number of interrupt sources and supports 32 interrupt vectors.

The Cortex-M family uses a number of methods to improve interrupt latency to up to 15 clock cycles for Cortex-M0+. It also can be used to wake the MCU core from Wait and VLPW modes.

2.1.3 AWIC

The asynchronous wake-up interrupt controller (AWIC) is used to detect asynchronous wake-up events in Stop mode and signal to clock control logic to resume system clocking. After clock restarts, the NVIC observes the pending interrupt and performs the normal interrupt or event processing. The AWIC can be used to wake MCU core from Stop and VLPS modes.

Wake-up sources are listed as below:

Table 2. AWIC stop wake-up sources

Wake-up source	Description
Available system resets	RESET pin with filter mode disabled or enabled when LPO is its clock source, COP when its clock source is enabled. COP can also work when its clock source is enabled during Stop mode.
Low-voltage detect	Power management controller—functional in Stop mode
Low-voltage warning	Power management controller—functional in Stop mode
Pin interrupts	Port control module—any enabled pin interrupt is capable of waking the system
ADC	The ADC is functional when using internal clock source or external crystal clock
CMP0	Interrupt in normal or trigger mode

Table continues on the next page...

Table 2. AWIC stop wake-up sources (continued)

Wake-up source	Description
I^2Cx	Address match wakeup
LPUART0 , LPUART1	Any enabled interrupt can be a source as long as the module remains clocked
UART2	Active edge on RXD
RTC	Alarm or seconds interrupt
NMI	$\overline{\text{NMI}}$ pin
TPMx	Any enabled interrupt can be a source as long as the module remains clocked
LPTMR	Any enabled interrupt can be a source as long as the module remains clocked
SPIx	Slave mode interrupt
FlexIO	Any enabled interrupt can be a source as long as the module remains clocked

2.1.4 Memory

This device has the following features:

- 8/16 KB of embedded RAM accessible (read/write) at CPU clock speed with 0 wait states.
- The non-volatile memory is divided into two arrays
  - 32/64 KB of embedded program memory
  - 16 KB ROM (built-in bootloader to support UART, I2C, and SPI interfaces)

  The program flash memory contains a 16-byte flash configuration field that stores default protection settings and security information. The page size of program flash is 1 KB.

  The protection setting can protect 32 regions of the program flash memory from unintended erase or program operations.

  The security circuitry prevents unauthorized access to RAM or flash contents from debug port.

- System register file

  This device contains a 32-byte register file that is powered in all power modes.

  Also, it retains contents during low power modes and is reset only during a power-on reset.

2.1.5 Reset and boot

The following table lists all the reset sources supported by this device.

NOTE

In the following table, Y means the specific module, except for the registers, bits or conditions mentioned in the footnote, is reset by the corresponding Reset source. N means the specific module is not reset by the corresponding Reset source.

Table 3. Reset source

2. Except SIM_SOPT1
3. Only if $\overline{\text{RESET}}$ is used to wake from VLLS mode.
4. Except SMC_PMCTRL, SMC_STOPCTRL, SMC_PMSTAT
5. Except RCM_RPFC, RCM_RPFW, RCM_FM

The CM0+ core adds support for a programmable Vector Table Offset Register (VTOR) to relocate the exception vector table after reset. This device supports booting from:

- internal flash
- boot ROM

The Flash Option (FOPT) register in the Flash Memory module (FTFA_FOPT) allows the user to customize the operation of the MCU at boot time. The register contains read-only bits that are loaded from the NVM's option byte in the flash configuration field. Below is boot flow chart for this device.

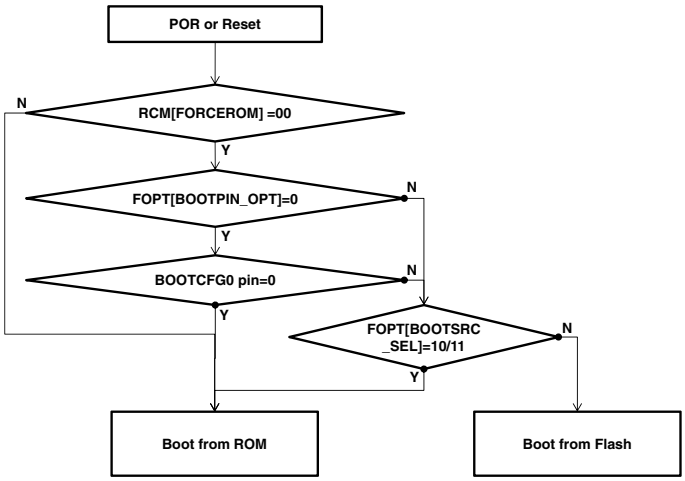

Figure 2. Boot flow chart

The blank chip is default to boot from ROM and remaps the vector table to ROM base address, otherwise, it remaps to flash address.

2.1.6 Clock options

This chip provides a wide range of sources to generate the internal clocks. These sources include internal resistor capacitor (IRC) oscillators, external oscillators, external clock sources, and ceramic resonators. These sources can be configured to provide the required performance and optimize the power consumption.

The IRC oscillators include the high-speed internal resister capacitor (HIRC) oscillator, the low-speed internal resister capacitor (LIRC) oscillator, and the low power oscillator (LPO).

The HIRC oscillator generates a 48 MHz clock.

The LIRC oscillator generates an 8 MHz or 2 MHz clock, and default to 8 MHz system clock on reset. The LIRC oscillator cannot be used in any VLLS modes.

The LPO generates a 1 kHz clock and cannot be used in VLLS0 mode.

The system oscillator supports low frequency crystals (32 kHz to 40 kHz), high frequency crystals (1 MHz to 32 MHz), and ceramic resonators (1 MHz to 32 MHz). An external clock source, DC to 48 MHz, can be used as the system clock through the EXTAL0 pin. The external oscillator also supports a low speed external clock (32.768 kHz) on the RTC_CLKIN pin for use with the RTC.

For more details on the clock operations and configurations, see Reference Manual.

The following figure is a high level block diagram of the clock generation.

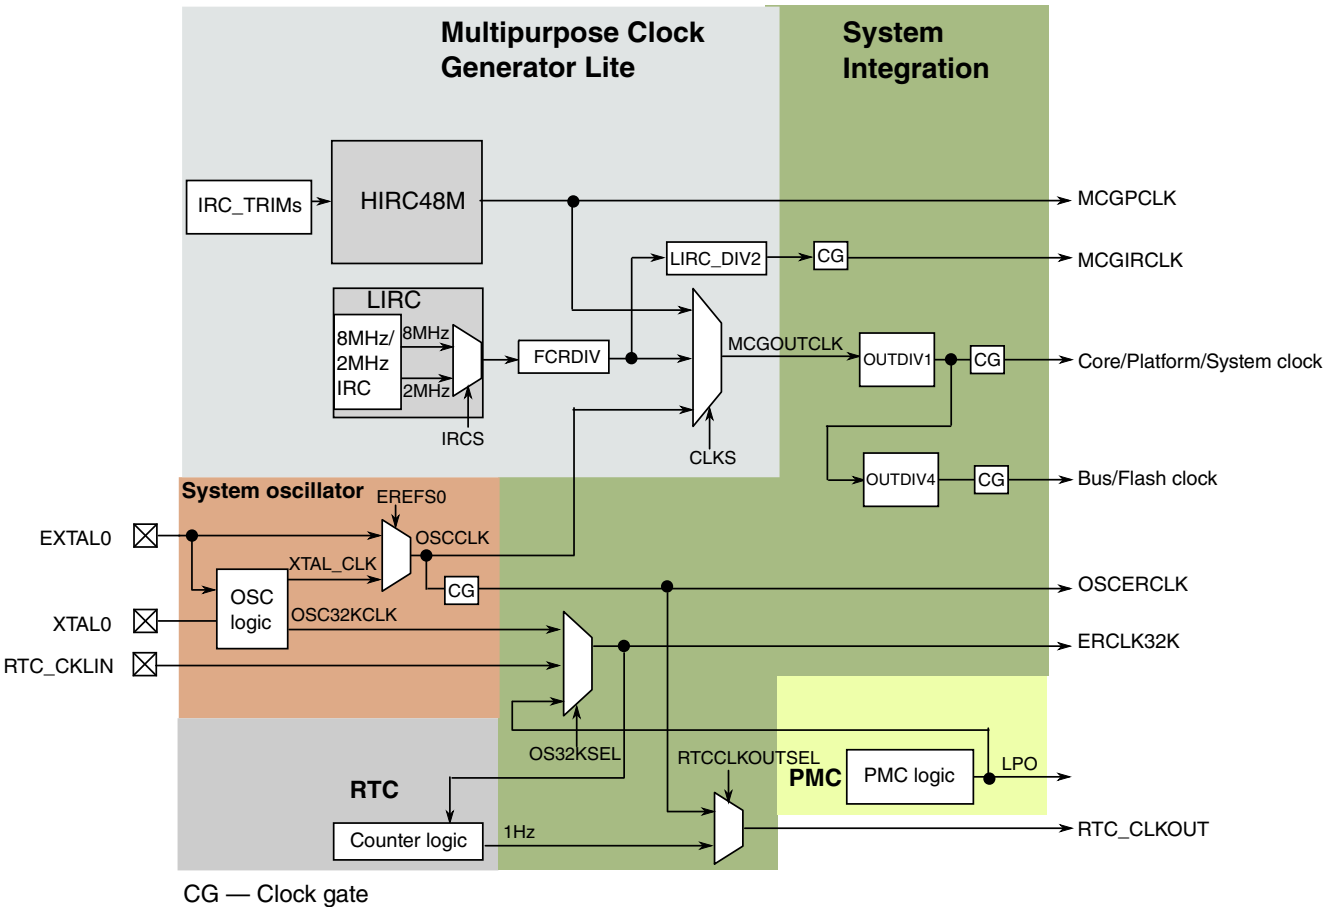

Figure 3. Clock block diagram

In order to provide flexibility, many peripherals can select from multiple clock sources for operation. This enables the peripheral to select a clock that will always be available during operation in various operational modes.

The following table summarizes the clocks associated with each module.

2.1.7 Security

Security state can be enabled via programming flash configuration field (0x40e). After enabling device security, the SWD port cannot access the memory resources of the MCU, and ROM boot loader is also limited to access flash and not allowed to read out flash information via ROM boot loader commands.

Access interface	Secure state	Unsecure operation
SWD port	Cannot access memory source by SWD interface	The debugger can write to the Flash Mass Erase in Progress field of the MDM-AP Control register to trigger a mass erase (Erase All Blocks) command
ROM boot loader Interface (UART/I2C/SPI)	Limit access to the flash, cannot read out flash content	Send “FlashEraseAllUnsecureh" command or attempt to unlock flash security using the backdoor key

This device features 80-bit unique identification number, which is programmed in factory and loaded to SIM register after power-on reset.

2.1.8 Power management

The Power Management Controller (PMC) expands upon ARM’s operational modes of Run, Sleep, and Deep Sleep, to provide multiple configurable modes. These modes can be used to optimize current consumption for a wide range of applications. The WFI or WFE instruction invokes a Wait or a Stop mode, depending on the current configuration. For more information on ARM’s operational modes, See the ARM® Cortex User Guide.

The PMC provides Run (Run), and Very Low Power Run (VLPR) configurations in ARM's Run operation mode. In these modes, the MCU core is active and can access all peripherals. The difference between the modes is the maximum clock frequency of the system and therefore the power consumption. The configuration that matches the power versus performance requirements of the application can be selected.

The PMC provides Wait (Wait) and Very Low Power Wait (VLPW) configurations in ARM's Sleep operation mode. In these modes, even though the MCU core is inactive, all of the peripherals can be enabled and operate as programmed. The difference between the modes is the maximum clock frequency of the system and therefore the power consumption.

The PMC provides Stop (Stop), Very Low Power Stop (VLPS), Low Leakage Stop (LLS), and Very Low Leakage Stop (VLLS) configurations in ARM's Deep Sleep operational mode. In these modes, the MCU core and most of the peripherals are disabled. Depending on the requirements of the application, different portions of the analog, logic, and memory can be retained or disabled to conserve power.

The Nested Vectored Interrupt Controller (NVIC), the Asynchronous Wake-up Interrupt Controller (AWIC), and the Low Leakage Wake-Up Controller (LLWU) are used to wake up the MCU from low power states. The NVIC is used to wake up the MCU core from WAIT and VLPW modes. The AWIC is used to wake up the MCU core from STOP and VLPS modes. The LLWU is used to wake up the MCU core from LLS and VLLSx modes.

For additional information regarding operational modes, power management, the NVIC, AWIC, or the LLWU, please refer to the Reference Manual.

The following table provides information about the state of the peripherals in the various operational modes and the modules that can wake MCU from low power modes.

Table 6. Peripherals states in different operational modes

Core mode	Device mode	Descriptions
Run mode	Run	In Run mode, all device modules are operational.
	Very Low Power Run	In VLPR mode, all device modules are operational at a reduced frequency except the Low Voltage Detect (LVD) monitor, which is disabled.
Sleep mode	Wait	In Wait mode, all peripheral modules are operational. The MCU core is placed into Sleep mode.
	Very Low Power Wait	In VLPW mode, all peripheral modules are operational at a reduced frequency except the Low Voltage Detect (LVD) monitor, which is disabled. The MCU core is placed into Sleep mode.

Table continues on the next page...

Table 6. Peripherals states in different operational modes (continued)

Core mode	Device mode	Descriptions
Deep sleep	Stop	In Stop mode, most peripheral clocks are disabled and placed in a static state. Stop mode retains all registers and SRAMs while maintaining Low Voltage Detection protection. In Stop mode, the ADC, CMP, LPTimer, RTC, and pin interrupts are operational. The NVIC is disabled, but the AWIC can be used to wake up from an interrupt.
	Very Low Power Stop	In VLPS mode, the contents of the SRAM are retained. The CMP (low speed), ADC, OSC, RTC, LPTMR, TPM, FlexIO, LPUART, and DMA are operational, LVD and NVIC are disabled, AWIC is used to wake up from interrupt.
	Low Leakage Stop	In LLS mode, the contents of the SRAM and the 32-byte system register file are retained. The CMP (low speed), LLWU, LPTMR, and RTC are operational. The ADC, CRC, DMA, FlexIO, I2C, LPUART, MCG-Lite, NVIC, PIT, SPI, TPM, UART, and COP are static, but retain their programming. The GPIO, and VREF are static, retain their programming, and continue to drive their previous values.
	Very Low Leakage Stop	In VLLS modes, most peripherals are powered off and will resume operation from their reset state when the device wakes up. The LLWU, LPTMR, and RTC are operational in all VLLS modes. In VLLS3, the contents of the SRAM and the 32-byte system register file are retained. The CMP (low speed), and PMC are operational. The GPIO, and VREF are not operational but continue driving. In VLLS1, the contents of the 32-byte system register file are retained. The CMP (low speed), and PMC are operational. The GPIO, and VREF are not operational but continue driving. In VLLS0, the contents of the 32-byte system register file are retained. The PMC is operational. The GPIO is not operational but continues driving. The POR detection circuit can be enabled or disabled.

2.1.9 LLWU

The LLWU module is used to wake MCU from low leakage power mode (LLS and VLLSx) and functional only on entry into a low-leakage power mode. After recovery from LLS, the LLWU is immediately disabled. After recovery from VLLSx, the LLWU continues to detect wake-up events until the user has acknowledged the wake-up event.

This device uses 8 external wakeup pin inputs and 4 internal modules as wakeup sources to the LLWU module.

The following is internal peripheral and external pin inputs as wakeup sources to the LLWU module.

Table 7. Wakeup source

2.1.10 Debug controller

This device supports standard ARM 2-pin SWD debug port. It provides register and memory accessibility from the external debugger interface, basic run/halt control plus 2 breakpoints and 2 watchpoints.

It also supports trace function with the Micro Trace Buffer (MTB), which provides a simple execution trace capability for the Cortex-M0+ processor.

2.1.11 COP

The COP monitors internal system operation and forces a reset in case of failure. It can run from bus clock, LPO, 8/2 MHz internal oscillator or external crystal oscillator. Optional window mode can detect deviations in program flow or system frequency.

The COP has the following features:

- Support multiple clock input, 1 kHz clock(LPO), bus clock, 8/2 MHz internal reference clock, external crystal oscillator
- Can work in Stop/VLPS and Debug mode

- Configurable for short and long timeout values, the longest timeout is up to 262 seconds
- Support window mode

2.2 Peripheral features

The following sections describe the features of each peripherals of the chip.

2.2.1 BME

The Bit Manipulation Engine (BME) provides hardware support for atomic read-modify-write memory operations to the peripheral address space in Cortex-M0+ based microcontrollers. It reduces up to 30% of the code size and up to 9% of the cycles for bit-oriented operations to peripheral registers.

The BME supports unsigned bit field extract, load-and-set 1-bit, load-and-clear 1-bit, bit field insert, logical AND/OR/XOR operations with byte, halfword or word-sized data type.

2.2.2 DMA and DMAMUX

The DMA controller module enables fast transfers of data, which provides an efficient way to move blocks of data with minimal processor interaction. The DMA controller in this device implements four channels which can be routed from up to 63 DMA request sources through DMA MUX module. Some of the peripheral request sources have asynchronous DMA capability which can be used to wake MCU from Stop mode. The peripherals which have such capability include LPUART0, LPUART1, FlexIO, TPM0-TPM2, ADC0, CMP0, PORTA-PORTE. The DMA channel 0 and 1 can be periodically triggered by PIT via DMA MUX.

Main features are listed below:

- Dual-address transfers via 32-bit master connection to the system bus and data transfers in 8-, 16-, or 32-bit blocks
- Supports programmable source and destination address and transfer size, optional modulo addressing from 16 bytes to 256 KB
- Automatic updates of source and destination addresses

- Auto-alignment feature for source or destination accesses allows block transfers to occur at the optimal size based on the address, byte count,and programmed size, which significantly improves the speed of block transfer
- Automatic single or double channel linking allows the current DMA channel to automatically trigger a DMA request to the linked channels without CPU intervention

For more information on asynchronous DMA, see AN4631.

2.2.3 TPM

This device contains three low power TPM modules (TPM). All TPM modules are functional in Stop/VLPS mode if the clock source is enabled.

The TPM features include:

- TPM clock mode is selectable from external clock input or internal clock source, HIRC48M clock, external crystal input clock or LIRC2M/8M clock.
- Prescaler divide-by 1, 2, 4, 8, 16, 32, 64, or 128
- TPM includes a 16-bit counter
- Includes 6 channels that can be configured for input capture, output compare, edge-aligned PWM mode, or center-aligned PWM mode
- Support the generation of an interrupt and/or DMA request per channel or counter overflow
- Support selectable trigger input to optionally reset or cause the counter to start or stop incrementing
- Support the generation of hardware triggers when the counter overflows and per channel

2.2.4 ADC

this device contains one ADC module. This ADC module supports hardware triggers from TPM, LPTMR, PIT, RTC, external trigger pin and CMP output. It supports wakeup of MCU in low power mode when using internal clock source or external crystal clock.

ADC module has the following features:

- Linear successive approximation algorithm with up to 16-bit resolution
- Up to four pairs of differential and 17 single-ended external analog inputs
- Support selectable 16-bit, 13-bit, 11-bit, and 9-bit differential output mode, or 16-bit, 12-bit, 10-bit, and 8-bit single-ended output modes

- Single or continuous conversion
- Configurable sample time and conversion speed/power
- Selectable clock source up to four
- Operation in low-power modes for lower noise
- Asynchronous clock source for lower noise operation with option to output the clock
- Selectable hardware conversion trigger
- Automatic compare with interrupt for less-than, greater-than or equal-to, within range, or out-of-range, programmable value
- Temperature sensor
- Hardware average function up to 32x
- Selectable voltage reference: external or alternate
- Self-Calibration mode

2.2.4.1 Temperature sensor

This device contains one temperature sensor internally connected to the input channel of AD26, see Table 55 for details of the linearity factor.

The sensor must be calibrated to gain good accuracy, so as to provide good linearity, see also AN3031. We recommend to use internal reference voltage as ADC reference with long sample time.

2.2.5 VREF

The Voltage Reference (VREF) can supply an accurate voltage output (1.2V typically) trimmed in 0.5 mV steps. It can be used in applications to provide a reference voltage to external devices or used internally as a reference to analog peripherals such as the ADC or CMP.

The VREF supports the following programmable buffer modes:

- Bandgap on only, used for stabilization and startup
- High power buffer mode
- Low-power buffer mode
- Buffer disabled

The VREF voltage output signal, bonded on VREFH for 48 QFN, 64 LQFP and 64 MAPBGA packages and on PTE30 for 32 QFN and 36 XFBGA packages, can be used by both internal and external peripherals in low and high power buffer mode. A 100 nF capacitor must always be connected between this pin and VSSA if the VREF is used. This capacitor must be as close to VREFO pin as possible.

2.2.6 CMP

The device contains one high-speed comparator and two 8-input multiplexers for both the inverting and non-inverting inputs of the comparator. Each CMP input channel connects to both muxes.

The CMP includes one 6-bit DAC, which provides a selectable voltage reference for various user application cases. Besides, the CMP also has several module-to-module interconnects in order to facilitate ADC triggering, TPM triggering, and interfaces.

The CMP has the following features:

- Inputs may range from rail to rail
- Programmable hysteresis control
- Selectable interrupt on rising-edge, falling-edge, or both rising or falling edges of the comparator output
- Selectable inversion on comparator output
- Capability to produce a wide range of outputs such as sampled, digitally filtered
- External hysteresis can be used at the same time that the output filter is used for internal functions
- Two software selectable performance levels: shorter propagation delay at the expense of higher power and Low power with longer propagation delay
- DMA transfer support
- Functional in all modes of operation except in VLLS0 mode
- The filter functions are not available in Stop, VLPS, LLS, or VLLSx modes
- Integrated 6-bit DAC with selectable supply reference source and can be power down to conserve power
- Two 8-to-1 channel mux

2.2.7 RTC

The RTC is an always powered-on block that remains active in all low power modes. The time counter within the RTC is clocked by a 32.768 kHz clock sourced from an external crystal using the oscillator or clock directly from RTC_CLKIN pin.

RTC is reset on power-on reset, and a software reset bit in RTC can also initialize all RTC registers.

The RTC module has the following features

- 32-bit seconds counter with roll-over protection and 32-bit alarm

- 16-bit prescaler with compensation that can correct errors between 0.12 ppm and 3906 ppm
- Register write protection with register lock mechanism
- 1 Hz square wave or second pulse output with optional interrupt

2.2.8 PIT

The Periodic Interrupt Timer (PIT) is used to generate periodic interrupt to the CPU. It has two independent channels and each channel has a 32-bit counter. Both channels can be chained together to form a 64-bit counter.

Channel 0 can be used to periodically trigger DMA channel 0, and channel 1 can be used to periodically trigger DMA channel 1. Either channel can be programmed as an ADC trigger source, or TPM trigger source. Channel 0 can be programmed to trigger DAC.

The PIT module has the following features:

- Each 32-bit timers is able to generate DMA trigger
- Each 32-bit timers is able to generate timeout interrupts
- Two timers can be cascaded to form a 64-bit timer
- Each timer can be programmed as ADC/TPM trigger source
- Timer 0 is able to trigger DAC

2.2.9 LPTMR

The low-power timer (LPTMR) can be configured to operate as a time counter with optional prescaler, or as a pulse counter with optional glitch filter, across all power modes, including the low-leakage modes. It can also continue operating through most system reset events, allowing it to be used as a time of day counter.

The LPTMR module has the following features:

- 16-bit time counter or pulse counter with compare
  - Optional interrupt can generate asynchronous wakeup from any low-power mode
  - Hardware trigger output
  - Counter supports free-running mode or reset on compare
- Configurable clock source for prescaler/glitch filter
- Configurable input source for pulse counter

2.2.10 CRC

This device contains one cyclic redundancy check (CRC) module which can generate 16/32-bit CRC code for error detection.

The CRC module provides a programmable polynomial, WAS, and other parameters required to implement a 16-bit or 32-bit CRC standard.

The CRC module has the following features:

- Hardware CRC generator circuit using a 16-bit or 32-bit programmable shift register
- Programmable initial seed value and polynomial
- Option to transpose input data or output data (the CRC result) bitwise or bytewise.
- Option for inversion of final CRC result
- 32-bit CPU register programming interface

2.2.11 UART

This device contains a basic universal asynchronous receiver/transmitter (UART) module with DMA function supported. Generally, this module is used in RS-232, RS-485, and other communications and supports LIN slave operation and ISO7816.

The UART module has the following features:

- Full-duplex operation
- 13-bit baud rate selection with /32 fractional divide, based on the module clock frequency
- Programmable 8-bit or 9-bit data format
- Programmable transmitter output polarity
- Programmable receive input polarity
- Up to 14-bit break character transmission.
- 11-bit break character detection option
- Two receiver wakeup methods with idle line or address mark wakeup
- Address match feature in the receiver to reduce address mark wakeup ISR overhead
- Ability to select MSB or LSB to be first bit on wire
- Support for ISO 7816 protocol to interface with SIM cards and smart cards
- Receiver framing error detection
- Hardware parity generation and checking

- 1/16 bit-time noise detection
- DMA interface

2.2.12 LPUART

This product contains two Low-Power UART modules, both of their clock sources are selectable from IRC48M, IRC8M/2M or external crystal clock, and can work in Stop and VLPS modes. They also support 4× to 32× data oversampling rate to meet different applications.

The LPUART module has the following features:

- Programmable baud rates (13-bit modulo divider) with configurable oversampling ratio from 4× to 32×
- Transmit and receive baud rate can operate asynchronous to the bus clock and can be configured independently of the bus clock frequency, support operation in Stop mode
- Interrupt, DMA or polled operation
- Hardware parity generation and checking
- Programmable 8-bit, 9-bit or 10-bit character length
- Programmable 1-bit or 2-bit stop bits
- Three receiver wakeup methods
  - Idle line wakeup
  - Address mark wakeup
  - Receive data match
- Automatic address matching to reduce ISR overhead:
  - Address mark matching
  - Idle line address matching
  - Address match start, address match end
- Optional 13-bit break character generation / 11-bit break character detection
- Configurable idle length detection supporting 1, 2, 4, 8, 16, 32, 64 or 128 idle characters
- Selectable transmitter output and receiver input polarity

2.2.13 SPI

This device contains two SPI modules. SPI modules support 8-bit and 16-bit modes. FIFO function is available only on SPI1 module.

The SPI modules have the following features:

- Full-duplex or single-wire bidirectional mode
- Programmable transmit bit rate
- Double-buffered transmit and receive data register
- Serial clock phase and polarity options
- Slave select output
- Mode fault error flag with CPU interrupt capability
- Control of SPI operation during wait mode
- Selectable MSB-first or LSB-first shifting
- Programmable 8- or 16-bit data transmission length
- Receive data buffer hardware match feature
- 64-bit FIFO mode for high speed/large amounts of data transfers
- Support DMA

2.2.14 I2C

This device contains two I2C modules, which support up to 1 Mbits/s by dual buffer features, and address match to wake MCU from the low power mode.

I2C modules support DMA transfer, and the interrupt condition can trigger DMA request when DMA function is enabled.

The I2C modules have the following features:

- Support for system management bus (SMBus) Specification, version 2
- Software programmable for one of 64 different serial clock frequencies
- Software-selectable acknowledge bit
- Arbitration-lost interrupt with automatic mode switching from master to slave
- Calling address identification interrupt
- START and STOP signal generation and detection
- Repeated START signal generation and detection
- Acknowledge bit generation and detection
- Bus busy detection
- General call recognition
- 10-bit address extension
- Programmable input glitch filter
- Low power mode wakeup on slave address match
- Range slave address support
- DMA support
- Double buffering support to achieve higher baud rate

2.2.15 FlexIO

The FlexIO is a highly configurable module providing a wide range of protocols including, but not limited to UART, I2C, SPI, I2S, Camera IF, LCD RGB, PWM/ Waveform generation. The module supports programmable baud rates independent of bus clock frequency, with automatic start/stop bit generation.

The FlexIO module has the following features:

- Functional in VLPR/VLPW/Stop/VLPS mode provided the clock it is using remains enabled
- Four 32-bit double buffered shift registers with transmit, receive, and data match modes, and continuous data transfer
- The timing of the shifter' shift, load and store events are controlled by the highly flexible 16-bit timer assigned to the shifter
- Two or more shifter can be concatenated to support large data transfer sizes
- Each 16-bit timers operates independently, supports for reset, enable and disable on a variety of internal or external trigger conditions with programmable trigger polarity
- Flexible pin configuration supporting output disabled, open drain, bidirectional output data and output mode
- Supports interrupt, DMA or polled transmit/receive operation

2.2.16 Port control and GPIO

The Port Control and Interrupt (PORT) module provides support for port control, digital filtering, and external interrupt functions. The GPIO data direction and output data registers control the direction and output data of each pin when the pin is configured for the GPIO function. The GPIO input data register displays the logic value on each pin when the pin is configured for any digital function, provided the corresponding Port Control and Interrupt module for that pin is enabled.

The following figure shows the basic I/O pad structure. This diagram applies to all I/O pins except PTA20/RESET_b and those configured as pseudo open-drain outputs. PTA20/RESET_b is a true open-drain pin without p-channel output driver or diode to the ESD bus. Pseudo open-drain pins have the p-channel output driver disabled when configured for open-drain operation. None of the I/O pins, including open-drain and pseudo open-drain pins, are allowed to go above VDD.

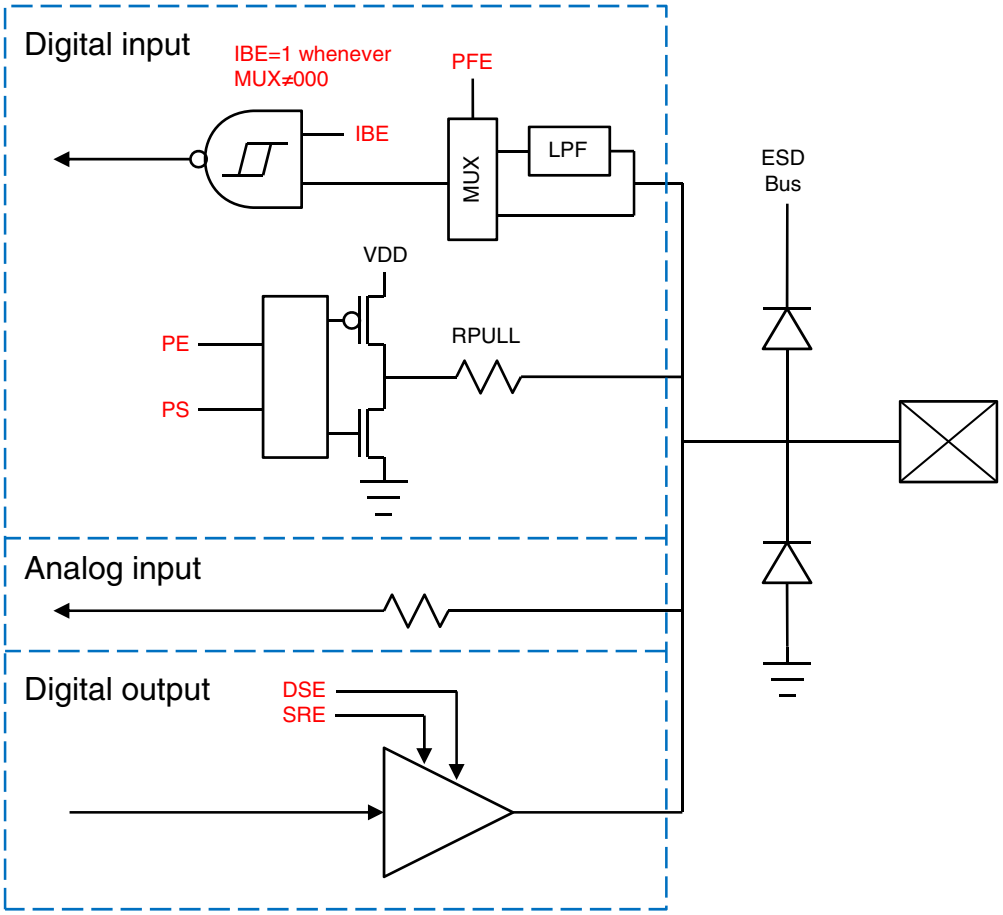

Figure 4. I/O simplified block diagram

The PORT module has the following features:

- all PIN support interrupt enable .
- Configurable edge(rising,falling,both) or level sensitive interrupt type
- Support DMA request
- Asynchronous wake-up in low-power modes
- Configurable pullup, pulldown, and pull-disable on select pins
- Configurable high and low drive strength on selected pins
- Configurable fast and slow slew rates on selected pins
- Configurable passive filter on selected pins
- Individual mux control field supporting analog or pin disabled, GPIO, and up to chip-specific digital functions
- Pad configuration fields are functional in all digital pin muxing modes.

The GPIO module has the following features:

- Port Data Input register visible in all digital pin-multiplexing modes
- Port Data Output register with corresponding set/clear/toggle registers

- Port Data Direction register
- GPIO support single-cycle access via fast GPIO.

3 Memory map

This device contains various memories and memory-mapped peripherals which are located in a 4 GB memory space. The following figure shows the system memory and peripheral locations

4 Pinouts

4.1 KL17 Signal Multiplexing and Pin Assignments

The following table shows the signals available on each pin and the locations of these pins on the devices supported by this document. The Port Control Module is responsible for selecting which ALT functionality is available on each pin.

NOTE

The 48 QFN and 64 MAPBGA packages for this product are not yet available. However, these packages are included in Package Your Way program for Kinetis MCUs. Visit freescale.com/KPYW for more details.

1. When I2C module is enabled and a pin is functional for I2C, this pin is (pseudo-) open drain enabled. When UART or LPUART module is enabled and a pin is functional for UART or LPUART, this pin is (pseudo-) open drain configurable.
2. PTA20 is a true open drain pin that must never be pulled above VDD.

4.3 Module Signal Description Tables

The following sections correlate the chip-level signal name with the signal name used in the module's chapter. They also briefly describe the signal function and direction.

4.3.1 Core modules

Table 9. SWD signal descriptions

Chip signal name	Module signal name	Description	I/O
SWD_DIO	SWD_DIO	Serial Wire Debug Data Input/Output The SWD_DIO pin is used by an external debug tool for communication and device control. This pin is pulled up internally.	Input / Output
SWD_CLK	SWD_CLK	Serial Wire Clock This pin is the clock for debug logic when in the Serial Wire Debug mode. This pin is pulled down internally.	Input

4.5 Package dimensions

The following figures show the dimensions of the package options for the devices supported by this document.

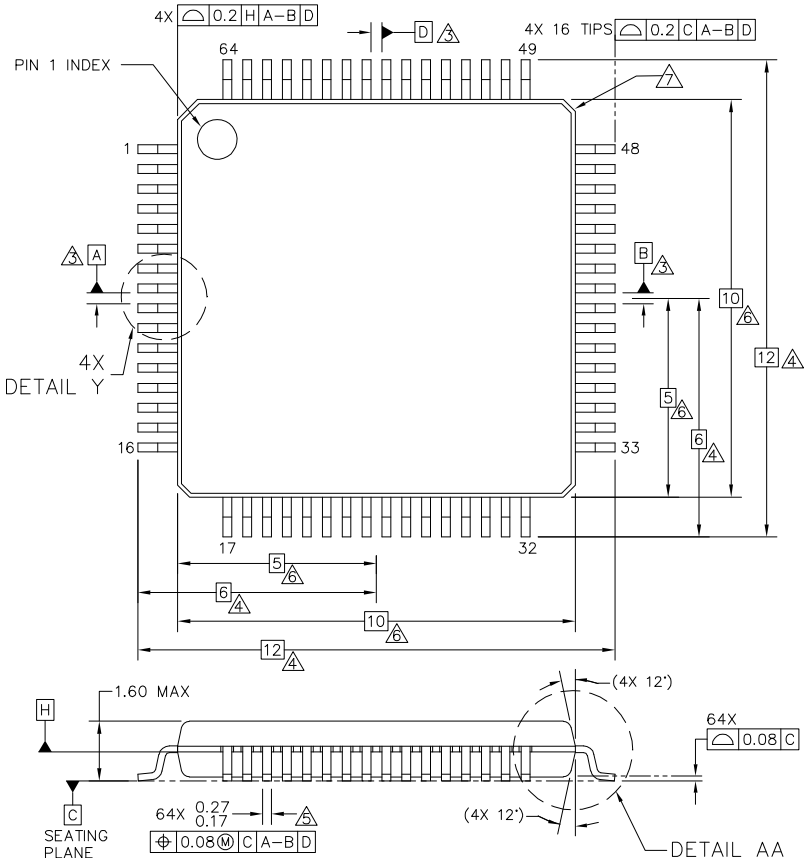

Figure 11. 64-pin LQFP package dimensions 1

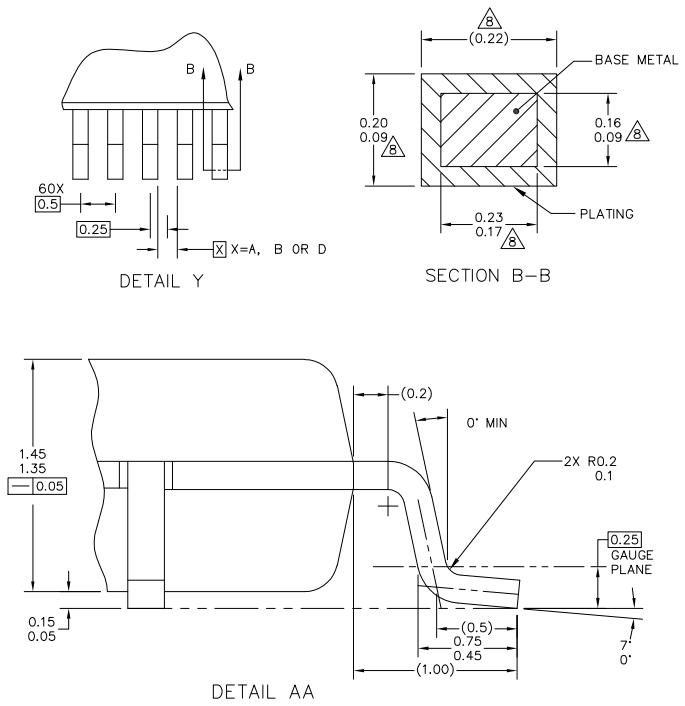

NOTES:

1. DIMENSIONS ARE IN MILLIMETERS.
2. DIMENSIONING AND TOLERANCING PER ASME Y14.5M–1994.
3. DATUMS A, B AND D TO BE DETERMINED AT DATUM PLANE H.
4. DIMENSIONS TO BE DETERMINED AT SEATING PLANE C.
5. THIS DIMENSION DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED THE UPPER LIMIT BY MORE THAN 0.08 MM AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT. MINIMUM SPACE BETWEEN PROTRUSION AND ADJACENT LEAD SHALL NOT BE LESS THAN 0.07 MM.
6. THIS DIMENSION DOES NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25 MM PER SIDE. THIS DIMENSION IS MAXIMUM PLASTIC BODY SIZE DIMENSION INCLUDING MOLD MISMATCH.
7. EXACT SHAPE OF EACH CORNER IS OPTIONAL.
8. THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.1 MM AND 0.25 MM FROM THE LEAD TIP.

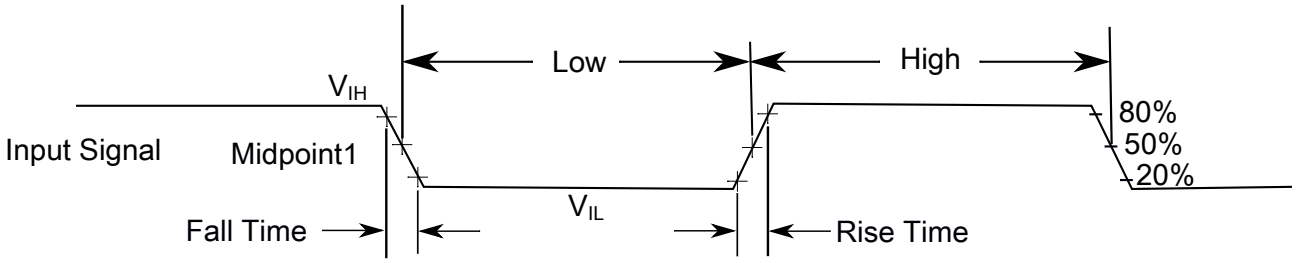
5.2 General

5.2.1 AC electrical characteristics

Unless otherwise specified, propagation delays are measured from the 50% to the 50% point, and rise and fall times are measured at the 20% and 80% points, as shown in the following figure.



The midpoint is $V_{IL} + (V_{IH} - V_{IL}) / 2$

Figure 19. Input signal measurement reference

All digital I/O switching characteristics, unless otherwise specified, assume that the output pins have the following characteristics.

- C_L=30 pF loads
- Slew rate disabled
- Normal drive strength

5.2.2 Nonswitching electrical specifications

5.2.2.1 Voltage and current operating requirements

Table 34. Voltage and current operating requirements

Symbol	Description	Min.	Max.	Unit	Notes
V_{DD}	Supply voltage	1.71	3.6	V	
V_{DDA}	Analog supply voltage	1.71	3.6	V	
$V_{DD} – V_{DDA}$	V_{DD}-to-V_{DDA} differential voltage	–0.1	0.1	V	
$V_{SS} – V_{SSA}$	V_{SS}-to-V_{SSA} differential voltage	–0.1	0.1	V	
V_{IH}	Input high voltage • 2.7 V ≤ V_{DD} ≤ 3.6 V • 1.7 V ≤ V_{DD} ≤ 2.7 V	 0.7 × V_{DD} 0.75 × V_{DD}	 — —	 V V	
V_{IL}	Input low voltage • 2.7 V ≤ V_{DD} ≤ 3.6 V • 1.7 V ≤ V_{DD} ≤ 2.7 V	 — —	 0.35 × V_{DD} 0.3 × V_{DD}	 V V	
V_{HYS}	Input hysteresis	0.06 × V_{DD}	—	V	
I_{ICIO}	IO pin negative DC injection current — single pin • V_{IN} < V_{SS}-0.3V	-3	—	mA	1
I_{ICcont}	Contiguous pin DC injection current —regional limit, includes sum of negative injection currents of 16 contiguous pins • Negative current injection	 -25	 —	 mA	
V_{ODPU}	Open drain pullup voltage level	V_{DD}	V_{DD}	V	2
V_{RAM}	V_{DD} voltage required to retain RAM	1.2	—	V	

1. All I/O pins are internally clamped to V_{SS} through a ESD protection diode. There is no diode connection to V_{DD}. If V_{IN} greater than V_{IO_MIN} (= V_{SS}-0.3 V) is observed, then there is no need to provide current limiting resistors at the pads. If this limit cannot be observed then a current limiting resistor is required. The negative DC injection current limiting resistor is calculated as R = (V_{IO_MIN} - V_{IN})/|I_{ICIO}|.
2. Open drain outputs must be pulled to V_{DD}.

3. Measured at V_{DD} supply voltage = V_{DD} min and Vinput = V_{SS}

5.2.2.4 Power mode transition operating behaviors

All specifications except t_{POR} and VLLSx → RUN recovery times in the following table assume this clock configuration:

- CPU and system clocks = 48 MHz
- Bus and flash clock = 24 MHz
- HIRC clock mode

Table 37. Power mode transition operating behaviors

5.2.2.5.1 Diagram: Typical IDD_RUN operating behavior

The following data was measured under these conditions:

- MCG-Lite in HIRC for run mode, and LIRC for VLPR mode
- No GPIOs toggled
- Code execution from flash
- For the ALLOFF curve, all peripheral clocks are disabled except FTFA

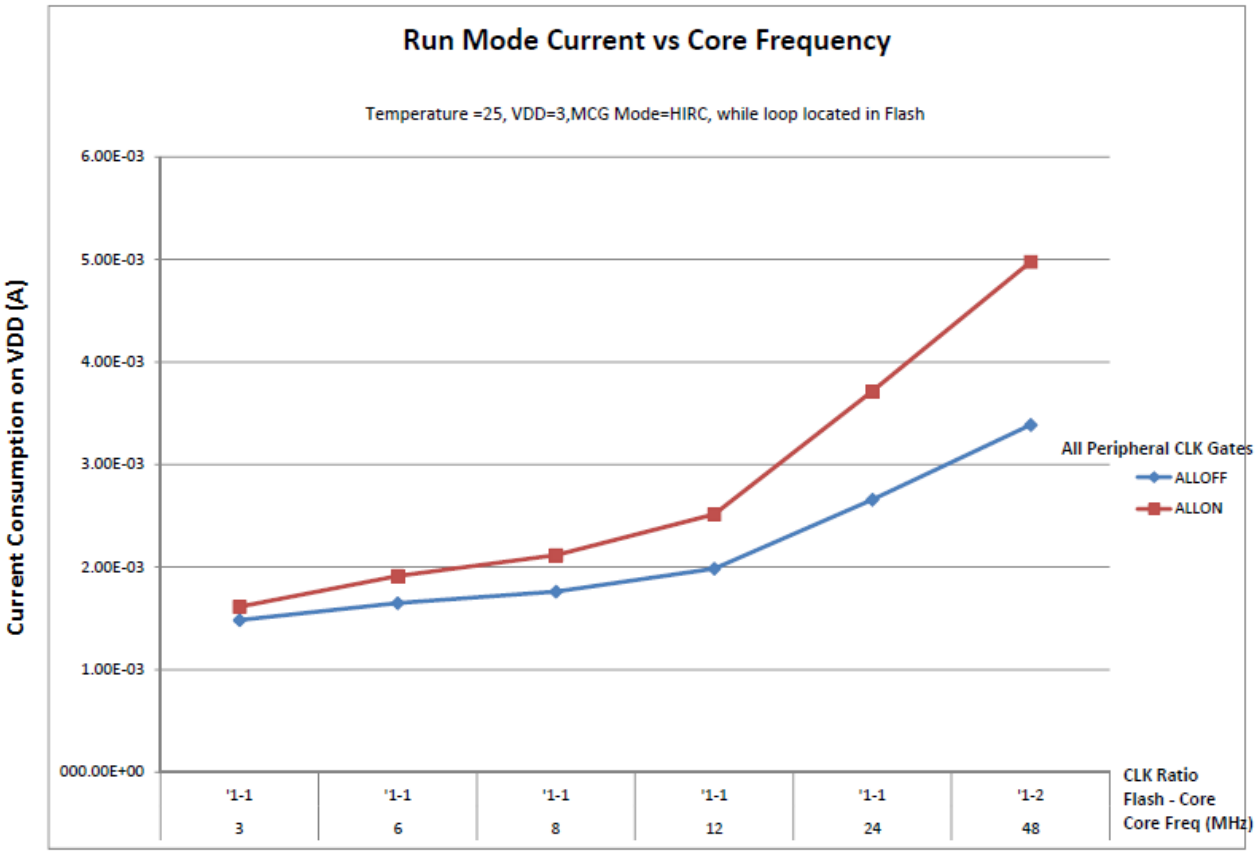

Figure 20. Run mode supply current vs. core frequency

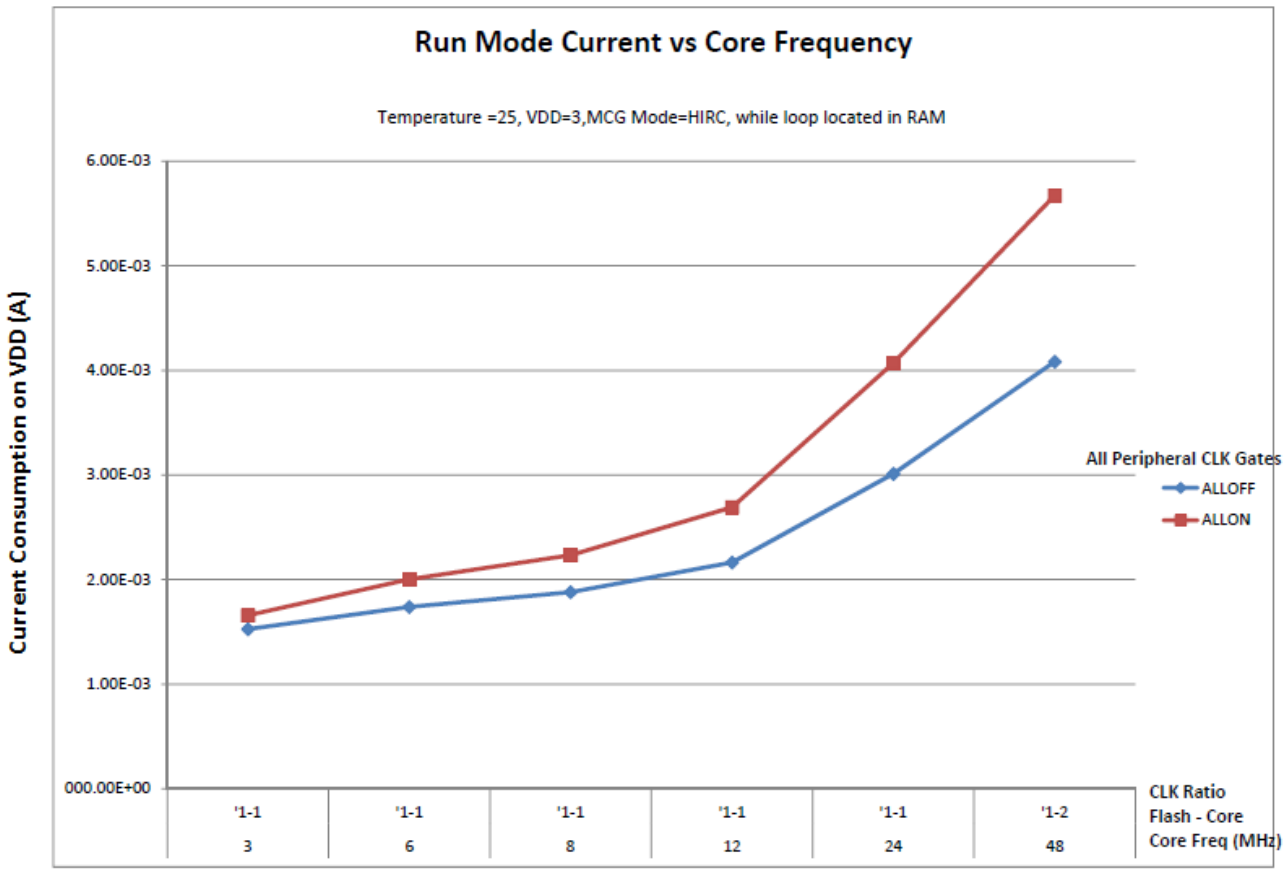

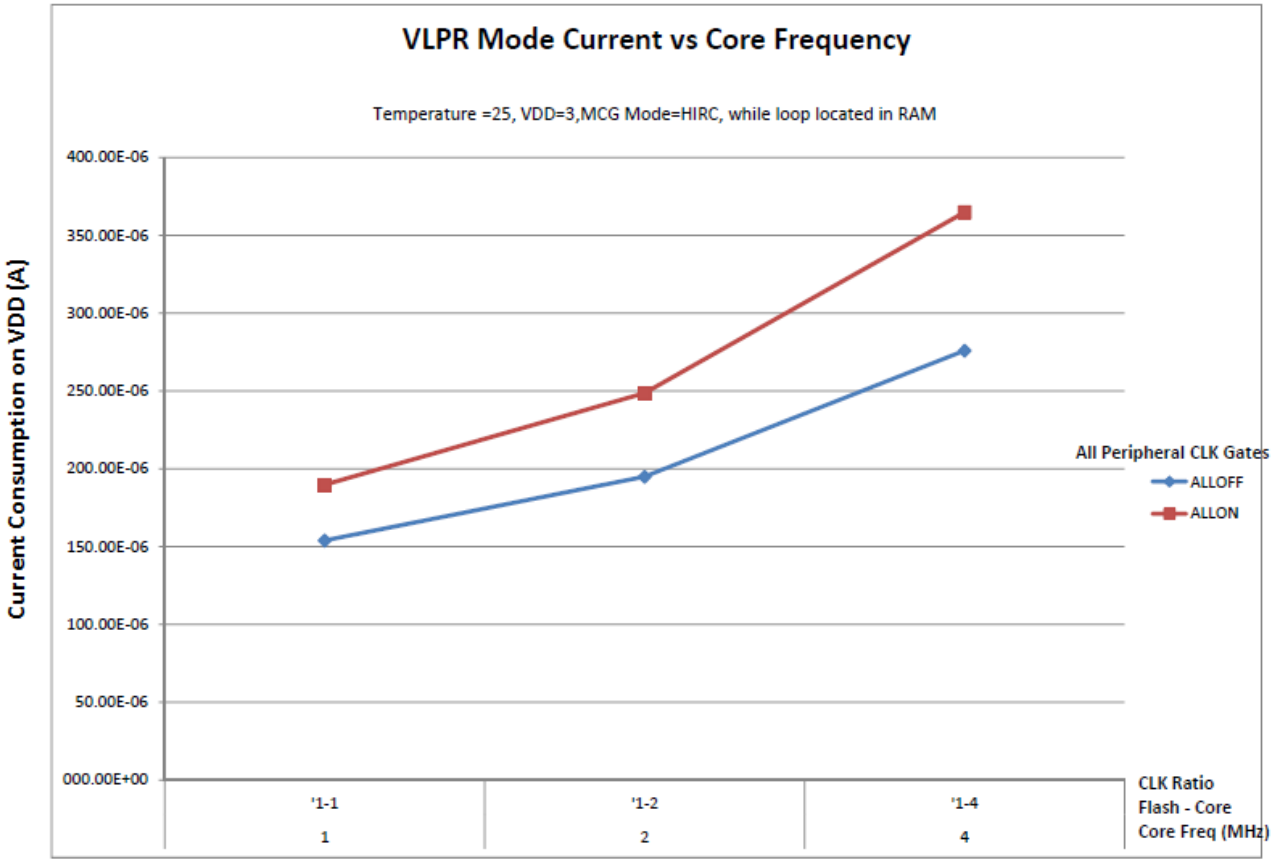

Figure 21. VLPR mode current vs. core frequency

5.2.2.6 EMC performance

Electromagnetic compatibility (EMC) performance is highly dependent on the environment in which the MCU resides. Board design and layout, circuit topology choices, location and characteristics of external components, and MCU software operation play a significant role in the EMC performance. The system designer can consult the following Freescale applications notes, available on freescale.com for advice and guidance specifically targeted at optimizing EMC performance.

5.2.3 Switching specifications

5.2.3.1 Device clock specifications

Table 41. Device clock specifications

Symbol	Description	Min.	Max.	Unit
Normal run mode				
f_{SYS}	System and core clock	—	48	MHz
f_{BUS}	Bus clock	—	24	MHz
f_{FLASH}	Flash clock	—	24	MHz
f_{LPTMR}	LPTMR clock	—	24	MHz
VLPR and VLPS modes[1]				
f_{SYS}	System and core clock	—	4	MHz
f_{BUS}	Bus clock	—	1	MHz
f_{FLASH}	Flash clock	—	1	MHz
f_{LPTMR}	LPTMR clock[2]	—	24	MHz
f_{ERCLK}	External reference clock	—	16	MHz
f_{LPTMR_ERCLK}	LPTMR external reference clock	—	16	MHz
$f_{osc\_hi\_2}$	Oscillator crystal or resonator frequency — high frequency mode (high range) (MCG_C2[RANGE]=1x)	—	16	MHz
f_{TPM}	TPM asynchronous clock	—	8	MHz
f_{UART0}	UART0 asynchronous clock	—	8	MHz

1. The frequency limitations in VLPR and VLPS modes here override any frequency specification listed in the timing specification for any other module. These same frequency limits apply to VLPS, whether VLPS was entered from RUN or from VLPR.
2. The LPTMR can be clocked at this speed in VLPR or VLPS only when the source is an external pin.

5.2.3.2 General switching specifications

These general-purpose specifications apply to all signals configured for GPIO and UART signals.

Table 42. General switching specifications

Description	Min.	Max.	Unit	Notes
GPIO pin interrupt pulse width (digital glitch filter disabled) — Synchronous path	1.5	—	Bus clock cycles	1
External RESET and NMI pin interrupt pulse width — Asynchronous path	100	—	ns	2
GPIO pin interrupt pulse width — Asynchronous path	16	—	ns	2
Port rise and fall time	—	36	ns	3

1. The synchronous and asynchronous timing must be met.
2. This is the shortest pulse that is guaranteed to be recognized.
3. 75 pF load

5.2.4 Thermal specifications

5.2.4.1 Thermal operating requirements

Table 43. Thermal operating requirements

Symbol	Description	Min.	Max.	Unit	Notes
T_J	Die junction temperature	–40	125	°C	
T_A	Ambient temperature	–40	105	°C	1

1. Maximum T_A can be exceeded only if the user ensures that T_J does not exceed the maximum. The simplest method to determine T_J is: $T_J = T_A + R_{\theta JA} \times$ chip power dissipation.

5.2.4.2 Thermal attributes

NOTE

The 48 QFN and 64 MAPBGA packages for this product are not yet available. However, it is included in Package Your Way program for Kinetis MCUs. Visit freescale.com/KPYW for more details.

Table 44. Thermal attributes

Board type	Symbol	Description	32 QFN	36 XFBGA	64 LQFP	Unit	Notes
Single-layer (1S)	$R_{\theta JA}$	Thermal resistance, junction to ambient (natural convection)	101	81.5	71	°C/W	1, 2, 3
Four-layer (2s2p)	$R_{\theta JA}$	Thermal resistance, junction to ambient (natural convection)	33	54.7	53	°C/W	1, 2, 3,4
Single-layer (1S)	$R_{\theta JMA}$	Thermal resistance, junction to ambient (200 ft./min. air speed)	84	71.3	60	°C/W	1, 4, 5
Four-layer (2s2p)	$R_{\theta JMA}$	Thermal resistance, junction to ambient (200 ft./min. air speed)	28	50.0	47	°C/W	1, 4, 5
—	$R_{\theta JB}$	Thermal resistance, junction to board	13	58.0	35	°C/W	6
—	$R_{\theta JC}$	Thermal resistance, junction to case	1.7	45.3	21	°C/W	7
—	Ψ_{JT}	Thermal characterization parameter, junction to package top outside center (natural convection)	3	1.2	5	°C/W	8
—	Ψ_{JB}	Thermal characterization parameter, junction to package bottom (natural convection)	-	44.5	-	°C/W	9

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
2. Per SEMI G38-87 and JEDEC JESD51-2 with the single layer board horizontal.
3. Per JEDEC JESD51-2 with natural convection for horizontally oriented board. Board meets JESD51-9 specification for 1s or 2s2p board, respectively.
4. Per JEDEC JESD51-6 with the board horizontal.
5. Per JEDEC JESD51-6 with forced convection for horizontally oriented board. Board meets JESD51-9 specification for 1s or 2s2p board, respectively.
6. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
7. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
8. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.
9. Thermal characterization parameter indicating the temperature difference between package bottom center and the junction temperature per JEDEC JESD51-12. When Greek letters are not available, the thermal characterization parameter is written as Psi-JB.

I_{DD48M}	Supply current	—	400	500	µA	
f_{irc48m}	Internal reference frequency	—	48	—	MHz	
$\Delta f_{irc48m\_ol\_lv}$	Open loop total deviation of IRC48M frequency at low voltage (VDD=1.71V-1.89V) over temperature	—	± 0.5	± 1.5	$\%f_{irc48m}$	
$\Delta f_{irc48m\_ol\_hv}$	Open loop total deviation of IRC48M frequency at high voltage (VDD=1.89V-3.6V) over temperature	—	± 0.5	± 1.0	$\%f_{irc48m}$	1
J_{cyc_irc48m}	Period Jitter (RMS)	—	35	150	ps	
$t_{irc48mst}$	Startup time	—	2	3	µs	2

1. The maximum value represents characterized results equivalent to the mean plus or minus three times the standard deviation (mean±3 sigma).
2. IRC48M startup time is defined as the time between clock enablement and clock availability for system use. Enable the clock by one of the following settings:
   - MCG operating in an external clocking mode and MCG_C7[OSCSEL]=10, or
   - SIM_SOPT2[PLLFLLSEL]=11

	Peak-to-peak amplitude of oscillation (oscillator mode) — low-frequency, high-gain mode (HGO=1)	—	V_{DD}	—	V	
	Peak-to-peak amplitude of oscillation (oscillator mode) — high-frequency, low-power mode (HGO=0)	—	0.6	—	V	
	Peak-to-peak amplitude of oscillation (oscillator mode) — high-frequency, high-gain mode (HGO=1)	—	V_{DD}	—	V	

1. V_{DD}=3.3 V, Temperature =25 °C
2. See crystal or resonator manufacturer's recommendation
3. C_x,C_y can be provided by using the integrated capacitors when the low frequency oscillator (RANGE = 00) is used. For all other cases external capacitors must be used.
4. When low power mode is selected, R_F is integrated and must not be attached externally.
5. The EXTAL and XTAL pins should only be connected to required oscillator components and must not be connected to any other devices.

5.3.3.2.2 Oscillator frequency specifications

Table 49. Oscillator frequency specifications

Symbol	Description	Min.	Typ.	Max.	Unit	Notes
f_{osc_lo}	Oscillator crystal or resonator frequency — low-frequency mode (MCG_C2[RANGE]=00)	32	—	40	kHz	
$f_{osc\_hi\_1}$	Oscillator crystal or resonator frequency — high-frequency mode (low range) (MCG_C2[RANGE]=01)	3	—	8	MHz	
$f_{osc\_hi\_2}$	Oscillator crystal or resonator frequency — high frequency mode (high range) (MCG_C2[RANGE]=1x)	8	—	32	MHz	
f_{ec_extal}	Input clock frequency (external clock mode)	—	—	48	MHz	1, 2
t_{dc_extal}	Input clock duty cycle (external clock mode)	40	50	60	%	
t_{cst}	Crystal startup time — 32 kHz low-frequency, low-power mode (HGO=0)	—	750	—	ms	3, 4
	Crystal startup time — 32 kHz low-frequency, high-gain mode (HGO=1)	—	250	—	ms	
	Crystal startup time — 8 MHz high-frequency (MCG_C2[RANGE]=01), low-power mode (HGO=0)	—	0.6	—	ms	
	Crystal startup time — 8 MHz high-frequency (MCG_C2[RANGE]=01), high-gain mode (HGO=1)	—	1	—	ms	

1. Other frequency limits may apply when external clock is being used as a reference for the FLL
2. When transitioning from FEI or FBI to FBE mode, restrict the frequency of the input clock so that, when it is divided by FRDIV, it remains within the limits of the DCO input clock frequency.
3. Proper PC board layout procedures must be followed to achieve specifications.
4. Crystal startup time is defined as the time between the oscillator being enabled and the OSCINIT bit in the MCG_S register being set.

5.3.4 Memories and memory interfaces

5.3.4.1 Flash electrical specifications

This section describes the electrical characteristics of the flash memory module.

5.3.4.1.1 Flash timing specifications — program and erase

The following specifications represent the amount of time the internal charge pumps are active and do not include command overhead.

Table 50. NVM program/erase timing specifications

Symbol	Description	Min.	Typ.	Max.	Unit	Notes
t_{hvpgm4}	Longword Program high-voltage time	—	7.5	18	µs	—
$t_{hversscr}$	Sector Erase high-voltage time	—	13	113	ms	1
$t_{hversall}$	Erase All high-voltage time	—	52	452	ms	1

1. Maximum time based on expectations at cycling end-of-life.

5.3.4.1.2 Flash timing specifications — commands

Table 51. Flash command timing specifications

Symbol	Description	Min.	Typ.	Max.	Unit	Notes
$t_{rd1sec1k}$	Read 1s Section execution time (flash sector)	—	—	60	µs	1
t_{pgmchk}	Program Check execution time	—	—	45	µs	1
t_{rdrsrc}	Read Resource execution time	—	—	30	µs	1
t_{pgm4}	Program Longword execution time	—	65	145	µs	—
t_{ersscr}	Erase Flash Sector execution time	—	14	114	ms	2
t_{rd1all}	Read 1s All Blocks execution time	—	—	0.9	ms	1
t_{rdonce}	Read Once execution time	—	—	25	µs	1
$t_{pgmonce}$	Program Once execution time	—	65	—	µs	—
t_{ersall}	Erase All Blocks execution time	—	70	575	ms	2
t_{vfykey}	Verify Backdoor Access Key execution time	—	—	30	µs	1
$t_{ersallu}$	Erase All Blocks Unsecure execution time	—	70	575	ms	2

1. Assumes 25 MHz flash clock frequency.
2. Maximum times for erase parameters based on expectations at cycling end-of-life.

5.3.4.1.3 Flash high voltage current behaviors

$t_{nvmretp1k}$	Data retention after up to 1 K cycles	20	100	—	years	—
$n_{nvmcycp}$	Cycling endurance	10 K	50 K	—	cycles	2

1. Typical data retention values are based on measured response accelerated at high temperature and derated to a constant 25 °C use profile. Engineering Bulletin EB618 does not apply to this technology. Typical endurance defined in Engineering Bulletin EB619.
2. Cycling endurance represents number of program/erase cycles at –40 °C ≤ T_j ≤ 125 °C.

5.3.5 Security and integrity modules

There are no specifications necessary for the device's security and integrity modules.

5.3.6 Analog

5.3.6.1 ADC electrical specifications

Using differential inputs can achieve better system accuracy than using single-end inputs.

C_{rate}	ADC conversion rate	16-bit mode No ADC hardware averaging Continuous conversions enabled, subsequent conversion time	37.037	—	461.467	ksps	5

1. Typical values assume V_{DDA} = 3.0 V, Temp = 25 °C, f_{ADCK} = 1.0 MHz, unless otherwise stated. Typical values are for reference only, and are not tested in production.
2. DC potential difference.
3. This resistance is external to MCU. To achieve the best results, the analog source resistance must be kept as low as possible. The results in this data sheet were derived from a system that had < 8 Ω analog source resistance. The R_{AS}/C_{AS} time constant should be kept to < 1 ns.
4. To use the maximum ADC conversion clock frequency, CFG2[ADHSC] must be set and CFG1[ADLPC] must be clear.
5. For guidelines and examples of conversion rate calculation, download the ADC calculator tool.

5.5 Communication interfaces

5.5.1 SPI switching specifications

The Serial Peripheral Interface (SPI) provides a synchronous serial bus with master and slave operations. Many of the transfer attributes are programmable. The following tables provide timing characteristics for classic SPI timing modes. See the SPI chapter of the chip's Reference Manual for information about the modified transfer formats used for communicating with slower peripheral devices.

All timing is shown with respect to 20% V_{DD} and 80% V_{DD} thresholds, unless noted, as well as input signal transitions of 3 ns and a 30 pF maximum load on all SPI pins.

5.5.2 Inter-Integrated Circuit Interface (I2C) timing

Table 64. I2C timing

Characteristic	Symbol	Standard Mode		Fast Mode		Unit
		Minimum	Maximum	Minimum	Maximum	
SCL Clock Frequency	f_{SCL}	0	100	0	400[1]	kHz
Hold time (repeated) START condition. After this period, the first clock pulse is generated.	t_{HD}; STA	4	—	0.6	—	µs
LOW period of the SCL clock	t_{LOW}	4.7	—	1.25	—	µs
HIGH period of the SCL clock	t_{HIGH}	4	—	0.6	—	µs
Set-up time for a repeated START condition	t_{SU}; STA	4.7	—	0.6	—	µs
Data hold time for I²C bus devices	t_{HD}; DAT	0[2]	3.45[3]	0[4]	0.9[2]	µs
Data set-up time	t_{SU}; DAT	250[5]	—	100[3, 6]	—	ns
Rise time of SDA and SCL signals	t_r	—	1000	20 +0.1C_b[7]	300	ns
Fall time of SDA and SCL signals	t_f	—	300	20 +0.1C_b[6]	300	ns
Set-up time for STOP condition	t_{SU}; STO	4	—	0.6	—	µs
Bus free time between STOP and START condition	t_{BUF}	4.7	—	1.3	—	µs
Pulse width of spikes that must be suppressed by the input filter	t_{SP}	N/A	N/A	0	50	ns

1. The maximum SCL Clock Frequency in Fast mode with maximum bus loading can be achieved only when using the high drive pins across the full voltage range and when using the normal drive pins and VDD ≥ 2.7 V.
2. The master mode I²C deasserts ACK of an address byte simultaneously with the falling edge of SCL. If no slaves acknowledge this address byte, then a negative hold time can result, depending on the edge rates of the SDA and SCL lines.
3. The maximum tHD; DAT must be met only if the device does not stretch the LOW period (tLOW) of the SCL signal.
4. Input signal Slew = 10 ns and Output Load = 50 pF
5. Set-up time in slave-transmitter mode is 1 IPBus clock period, if the TX FIFO is empty.
6. A Fast mode I²C bus device can be used in a Standard mode I2C bus system, but the requirement $t_{SU;\ DAT} \geq 250$ ns must then be met. This is automatically the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, then it must output the next data bit to the SDA line $t_{rmax} + t_{SU;\ DAT} = 1000 + 250 = 1250$ ns (according to the Standard mode I²C bus specification) before the SCL line is released.
7. C_b = total capacitance of the one bus line in pF.

To achieve 1MHz I2C clock rates, consider the following recommendations:

- To counter the effects of clock stretching, the I2C baud Rate select bits can be configured for faster than desired baud rate.
- Use high drive pad and DSE bit should be set in PORTx_PCRn register.
- Minimize loading on the I2C SDA and SCL pins to ensure fastest rise times for the SCL line to avoid clock stretching.
- Use smaller pull up resistors on SDA and SCL to reduce the RC time constant.

Table 65. I²C 1Mbit/s timing

Characteristic	Symbol	Minimum	Maximum	Unit
SCL Clock Frequency	f_{SCL}	0	1[1]	MHz
Hold time (repeated) START condition. After this period, the first clock pulse is generated.	t_{HD}; STA	0.26	—	µs
LOW period of the SCL clock	t_{LOW}	0.5	—	µs
HIGH period of the SCL clock	t_{HIGH}	0.26	—	µs
Set-up time for a repeated START condition	t_{SU}; STA	0.26	—	µs
Data hold time for I_2C bus devices	t_{HD}; DAT	0	—	µs
Data set-up time	t_{SU}; DAT	50	—	ns
Rise time of SDA and SCL signals	t_r	20 +0.1C_b	120	ns
Fall time of SDA and SCL signals	t_f	20 +0.1C_b[2]	120	ns
Set-up time for STOP condition	t_{SU}; STO	0.26	—	µs
Bus free time between STOP and START condition	t_{BUF}	0.5	—	µs
Pulse width of spikes that must be suppressed by the input filter	t_{SP}	0	50	ns

1. The maximum SCL clock frequency of 1 Mbit/s can support maximum bus loading when using the high drive pins across the full voltage range.
2. C_b = total capacitance of the one bus line in pF.

6 Design considerations

6.1 Hardware design considerations

This device contains protective circuitry to guard against damage due to high static voltage or electric fields. However, take normal precautions to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit.

6.1.1 Printed circuit board recommendations

- Place connectors or cables on one edge of the board and do not place digital circuits between connectors.
- Drivers and filters for I/O functions must be placed as close to the connectors as possible. Connect TVS devices at the connector to a good ground. Connect filter capacitors at the connector to a good ground.
- Physically isolate analog circuits from digital circuits if possible.
- Place input filter capacitors as close to the MCU as possible.
- For best EMC performance, route signals as transmission lines; use a ground plane directly under LQFP packages; and solder the exposed pad (EP) to ground directly under QFN packages.

6.1.2 Power delivery system

Consider the following items in the power delivery system:

- Use a plane for ground.
- Use a plane for MCU VDD supply if possible.
- Always route ground first, as a plane or continuous surface, and never as sequential segments.
- Route power next, as a plane or traces that are parallel to ground traces.
- Place bulk capacitance, 10 µF or more, at the entrance of the power plane.
- Place bypass capacitors for MCU power domain as close as possible to each VDD/VSS pair, including VDDA/VSSA and VREFH/VREFL.
- The minimum bypass requirement is to place 0.1 µF capacitors positioned as near as possible to the package supply pins.
- Take special care to minimize noise levels on the VREFH/VREFL inputs. An option is to use the internal reference voltage (output 1.2 V typically) as the ADC reference.

NOTE

The internal reference voltage output (VREFO) is bonded to the VREFH pin on some packages and to PTE30 on other packages. When the VREFO output is used, a 0.1 µF capacitor

is required as a filter. Do not connect any other supply voltage to the pin that has VREFO activated.

6.1.3 Analog design

Each ADC input must have an RC filter as shown in the following figure. The maximum value of R must be RAS max if fast sampling and high resolution are required. The value of C must be chosen to ensure that the RC time constant is very small compared to the sample period.

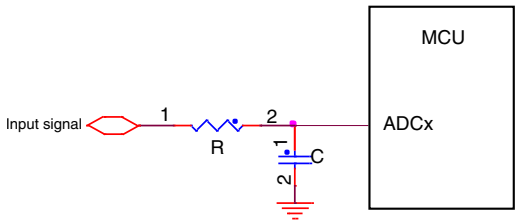

Figure 34. RC circuit for ADC input

High voltage measurement circuits require voltage division, current limiting, and over-voltage protection as shown the following figure. The voltage divider formed by R1 – R4 must yield a voltage less than or equal to VREFH. The current must be limited to less than the injection current limit. Since the ADC pins do not have diodes to VDD, external clamp diodes must be included to protect against transient over-voltages.

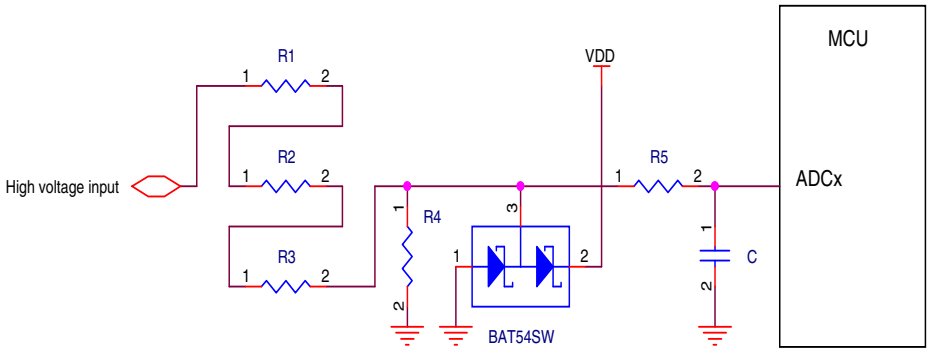

Figure 35. High voltage measurement with an ADC input

6.1.4 Digital design

Ensure that all I/O pins cannot get pulled above VDD (Max I/O is VDD+0.3V).

CAUTION

Do not provide power to I/O pins prior to VDD, especially the RESET_b pin.

- RESET_b pin

  The RESET_b pin is an open-drain I/O pin that has an internal pullup resistor. An external RC circuit is recommended to filter noise as shown in the following figure. The resistor value must be in the range of 4.7 kΩ to 10 kΩ; the recommended capacitance value is 0.1 µF. The RESET_b pin also has a selectable digital filter to reject spurious noise.

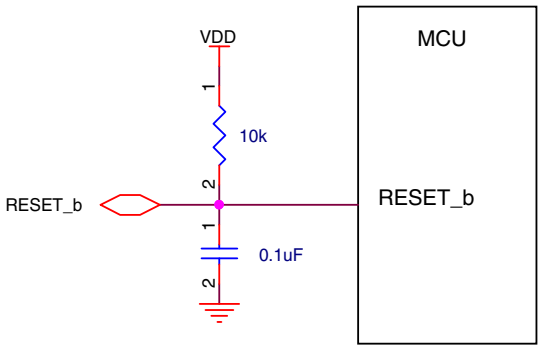

Figure 36. Reset circuit

When an external supervisor chip is connected to the RESET_b pin, a series resistor must be used to avoid damaging the supervisor chip or the RESET_b pin, as shown in the following figure. The series resistor value (RS below) must be in the range of 100 Ω to 1 kΩ depending on the external reset chip drive strength. The supervisor chip must have an active high, open-drain output.

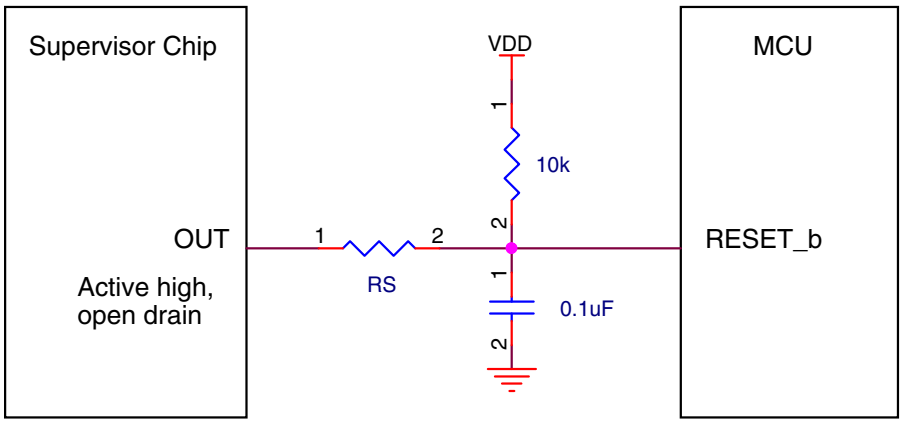

Figure 37. Reset signal connection to external reset chip

- NMI pin

  Do not add a pull-down resistor or capacitor on the NMI_b pin, because a low level on this pin will trigger non-maskable interrupt. When this pin is enabled as the NMI function, an external pull-up resistor (10 kΩ) as shown in the following figure is recommended for robustness.

  If the NMI_b pin is used as an I/O pin, the non-maskable interrupt handler is required to disable the NMI function by remapping to another function. The NMI function is disabled by programming the FOPT[NMI_DIS] bit to zero.

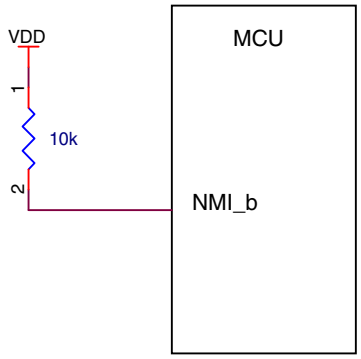

Figure 38. NMI pin biasing

- Debug interface

  This MCU uses the standard ARM SWD interface protocol as shown in the following figure. While pull-up or pull-down resistors are not required (SWD_DIO has an internal pull-up and SWD_CLK has an internal pull-down), external 10 kΩ pull resistors are recommended for system robustness. The RESET_b pin recommendations mentioned above must also be considered.

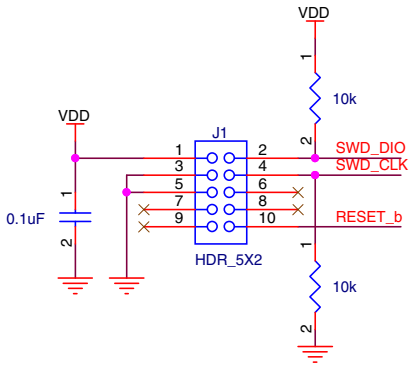

Figure 39. SWD debug interface

- Low leakage stop mode wakeup

  Select low leakage wakeup pins (LLWU_Px) to wake the MCU from one of the low leakage stop modes (LLS/VLLSx). See KL17 Signal Multiplexing and Pin Assignments for pin selection.

- Unused pin

  Unused GPIO pins must be left floating (no electrical connections) with the MUX field of the pin's PORTx_PCRn register equal to 0:0:0. This disables the digital input path to the MCU.

6.1.5 Crystal oscillator

When using an external crystal or ceramic resonator as the frequency reference for the MCU clock system, refer to the following table and diagrams.

The feedback resistor, RF, is incorporated internally with the low power oscillators. An external feedback is required when using high gain (HGO=1) mode.

The series resistor, RS, is required in high gain (HGO=1) mode when the crystal or resonator frequency is below 2MHz. Otherwise, the low power oscillator (HGO=0) must not have any series resistance; and the high frequency, high gain oscillator with a frequency above 2MHz does not require any series resistance.

Internal load capacitors (Cx, Cy) are provided in the low frequency (32.786kHz) mode. Use the SCxP bits in the OSC0_CR register to adjust the load capacitance for the crystal. Typically, values of 10pf to 16pF are sufficient for 32.768kHz crystals that have a 12.5pF CL specification. The internal load capacitor selection must not be used for high frequency crystals and resonators.
