

Typical Application Circuit

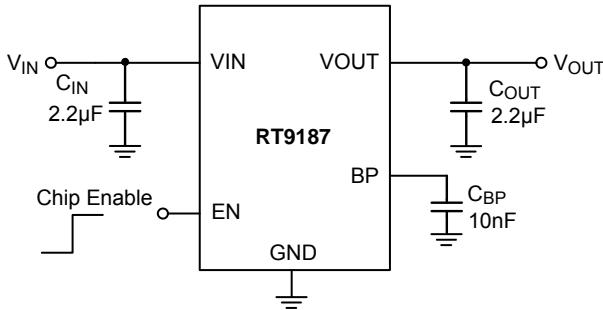

Figure 1. Fixed Operation

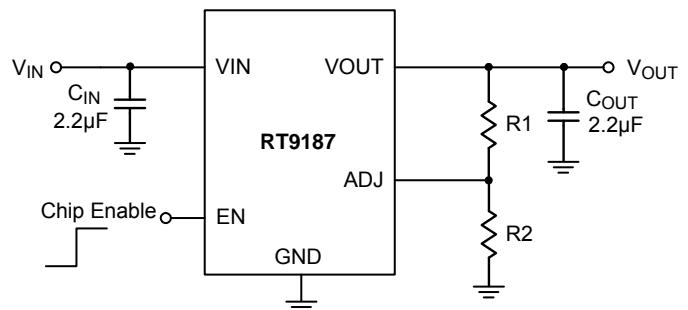

Figure 2. Adjustable Operation

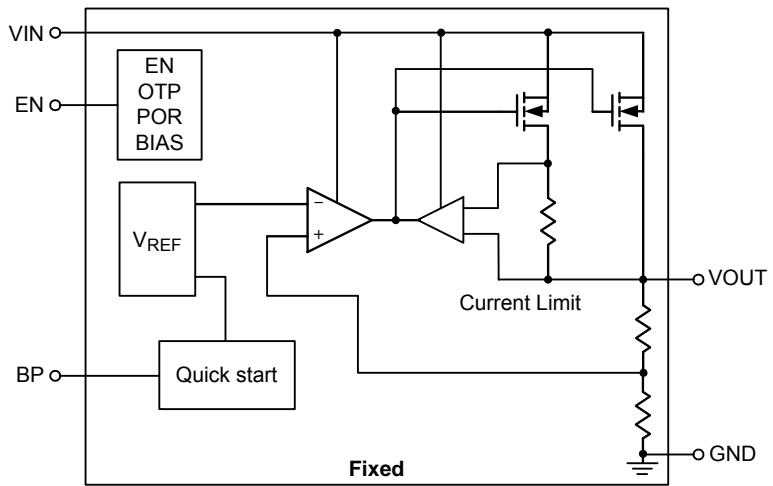

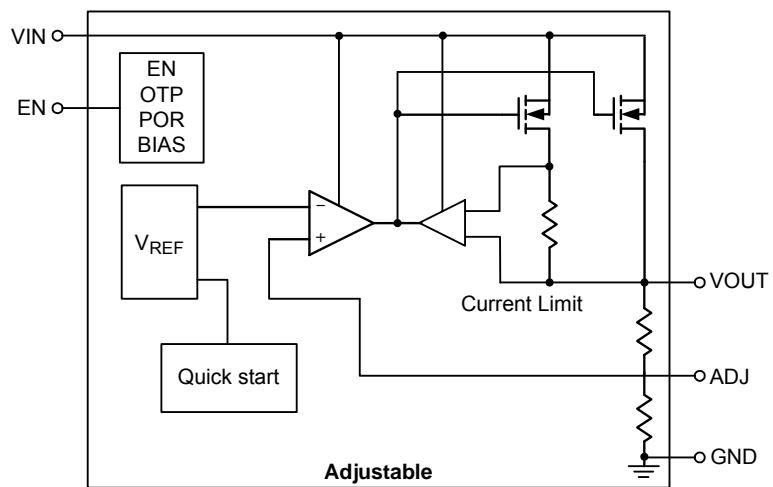

$$V_{OUT} = 0.8 \times \left(1 + \frac{R_1}{R_2}\right) \text{ Volts}$$

Note : The value of R_2 should be less than $80k$ to maintain regulation.

Function Pin Description

Pin No.		Pin Name	Pin Function
Fixed Output Voltage	Adjustable Output Voltage		
1	1	VIN	Supply input.
2	2	VIN	Supply input.
3	3	VOUT	Regulator output.
4	4	VOUT	Regulator output.
5	--	BP	Noise reduction. Connecting a $10nF$ capacitor to GND to reduce output noise.
--	5	ADJ	If external feedback resistors are applied, the output voltage will be: $V_{OUT} = 0.8 \times \left(1 + \frac{R_1}{R_2}\right) V$
6, 9 (Exposed Pad)	6, 9 (Exposed Pad)	GND	Ground. The exposed pad must be soldered to a large PCB and connected to GND for maximum power dissipation.
7	7	NC	No internal connection.
8	8	EN	Enable input logic, active high. When the EN goes to a logic low, the device is in shutdown mode.

Note 1. Stresses listed as the above "Absolute Maximum Ratings" may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

Note 2. θ_{JA} is measured in natural convection at $T_A = 25^\circ\text{C}$ on a high effective thermal conductivity four-layer test board of JEDEC 51-7 thermal measurement standard. The measurement case position of θ_{JC} is on the exposed pad of the package.

Note 3. Devices are ESD sensitive. Handling precaution is recommended.

Note 4. The device is not guaranteed to function outside its operating conditions.

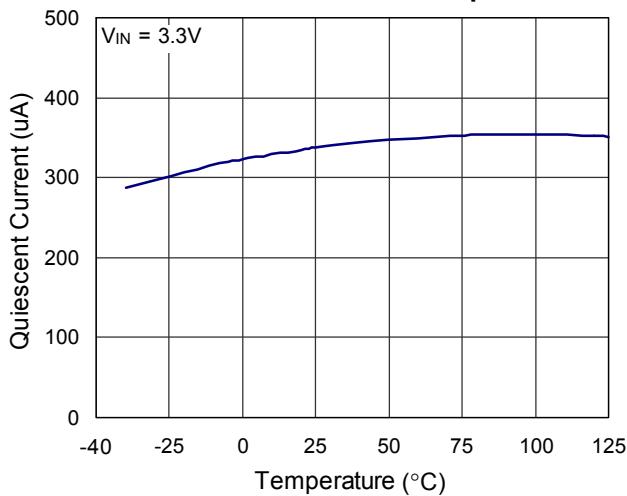

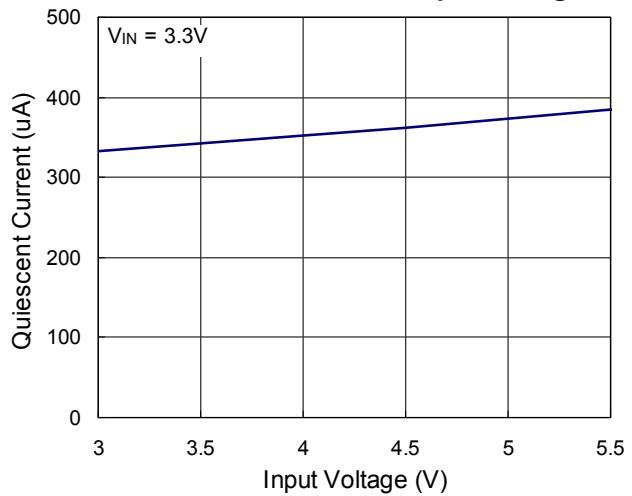

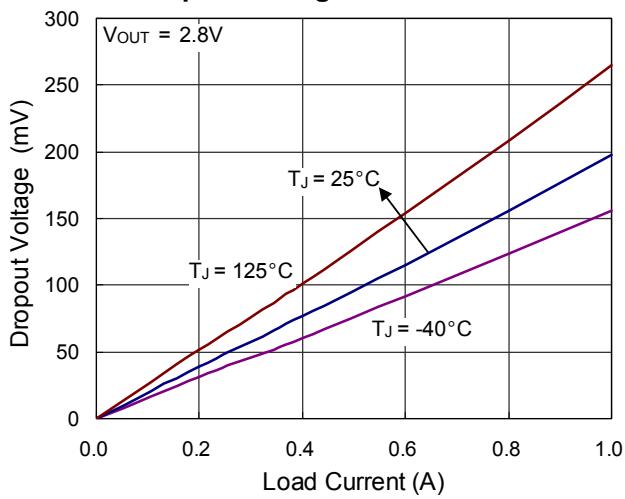

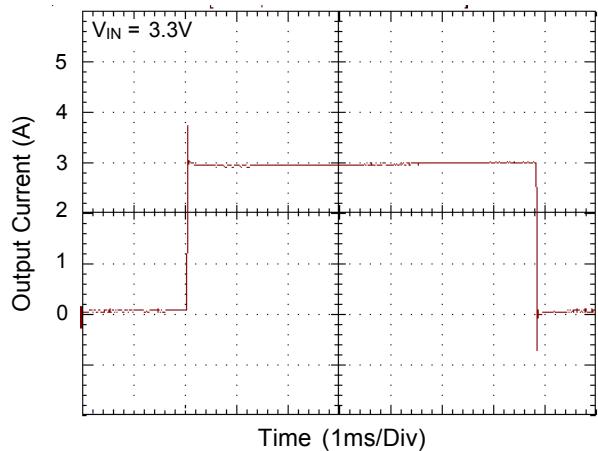

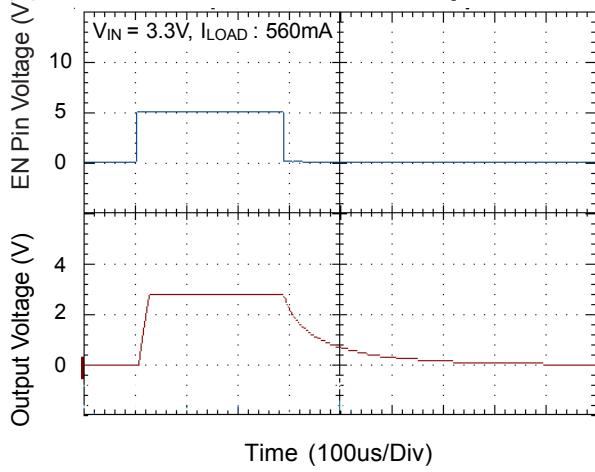

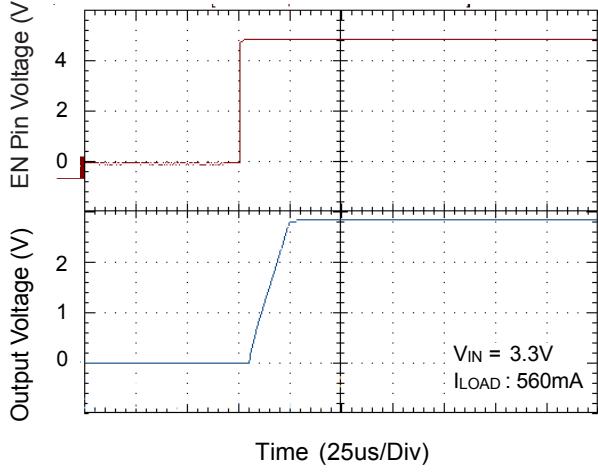

Note 5. Quiescent, or ground current, is the difference between input and output currents. It is defined by $I_Q = I_{IN} - I_{OUT}$ under no load condition ($I_{OUT} = 0mA$). The total current drawn from the supply is the sum of the load current plus the ground pin current.

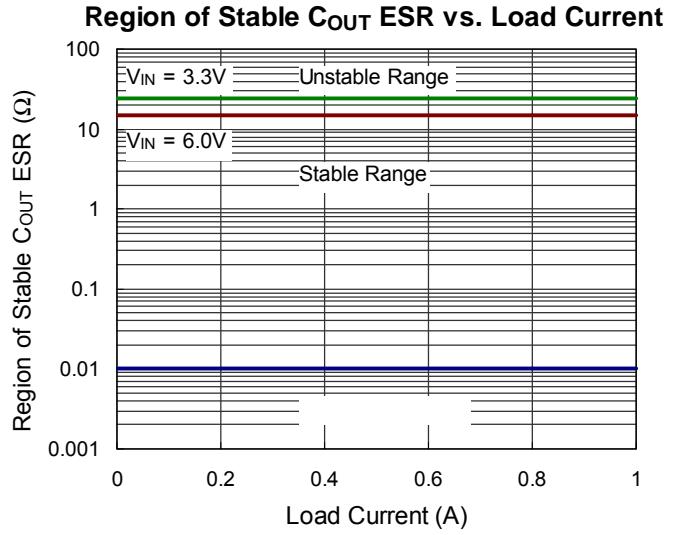

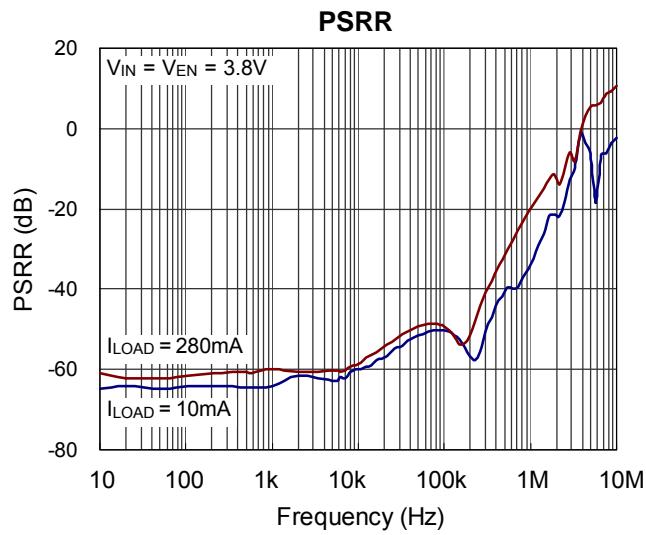

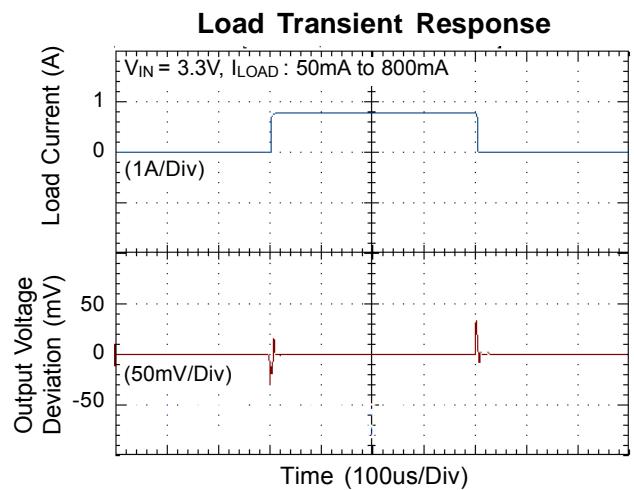

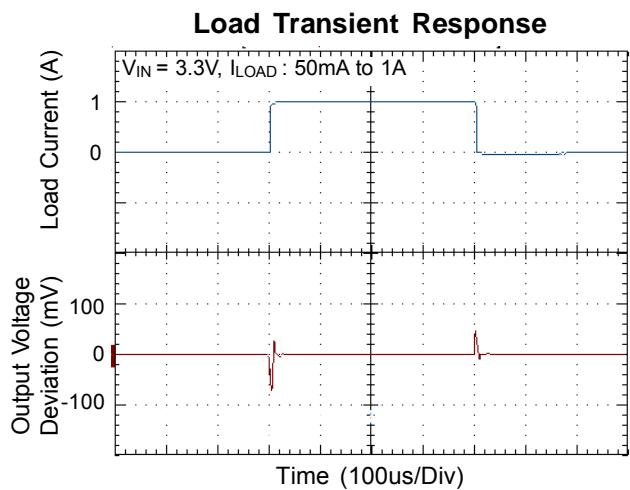

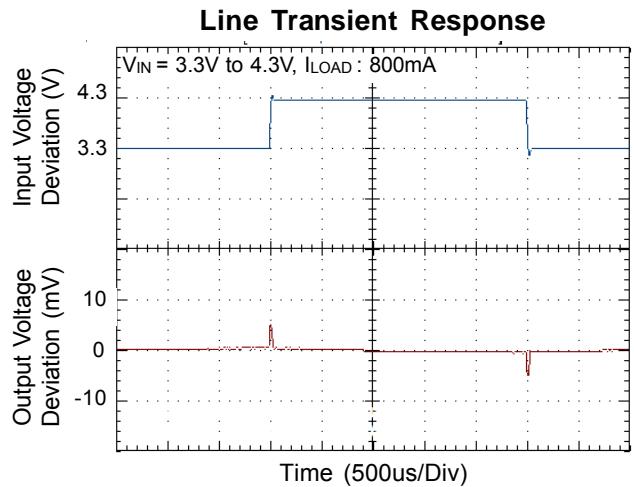

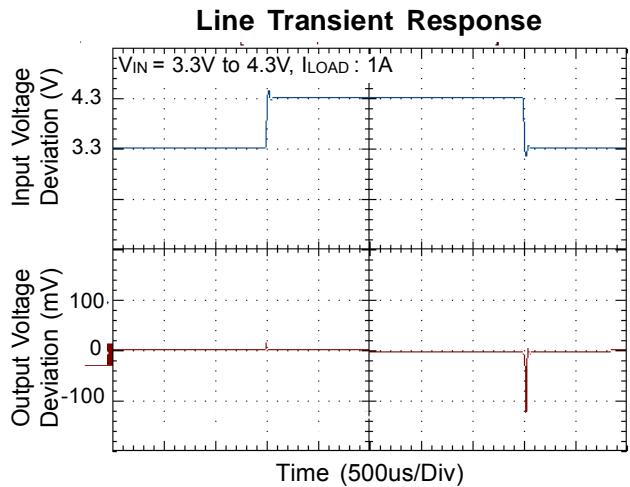

Note 6. Standby current is the input current drawn by a regulator when the output voltage is disabled by a shutdown signal ($V_{EN} > 1.8V$).

Note 7. The dropout voltage is defined as $V_{IN} - V_{OUT}$, which is measured when V_{OUT} is $V_{OUT(NORMAL)} - \Sigma 100mV$.

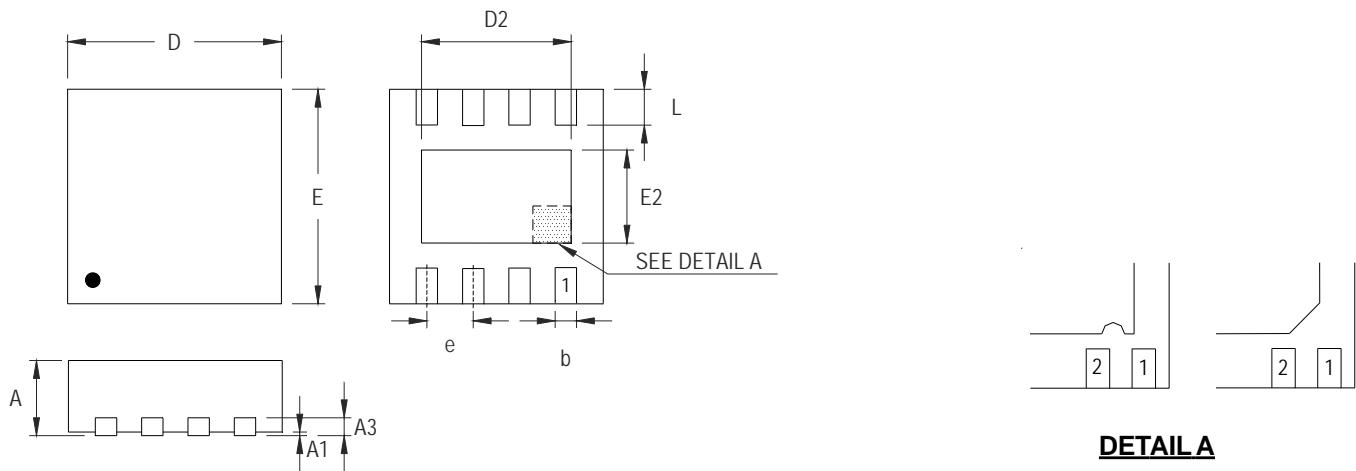

Note 8. Regulation is measured at constant junction temperature by using a 2ms current pulse. Devices are tested for load regulation in the load range from 10mA to 1.0A.

Note 9. Performance at $-5^\circ\text{C} \leq T_A \leq 85^\circ\text{C}$ is assured by design.
