Pin Definitions

Signal Name	Description	I/O	Description
D_{0-8}	Data Inputs	I	**Data Inputs for 9-bit bus**.
Q_{0-8}	Data Outputs	O	**Data Outputs for 9-bit bus**.
WEN1	Write Enable 1	I	**The only write enable when device is configured to have programmable flags.** Data is written on a LOW-to-HIGH transition of WCLK when WEN1 is asserted and FF is HIGH. If the FIFO is configured to have two write enables, data is written on a LOW-to-HIGH transition of WCLK when WEN1 is LOW and WEN2/LD and FF are HIGH.
WEN2/LD Dual Mode Pin	Write Enable 2	I	**If HIGH at reset, this pin operates as a second write enable**. If LOW at reset, this pin operates as a control to write or read the programmable flag offsets. WEN1 must be LOW and WEN2 must be HIGH to write data into the FIFO. Data will not be written into the FIFO if the FF is LOW. If the FIFO is configured to have programmable flags, WEN2/LD is held LOW to write or read the programmable flag offsets.
	Load	I	
REN1, REN2	Read Enable Inputs	I	**Enables the device for Read operation**.
WCLK	Write Clock	I	**The rising edge clocks data into the FIFO when WEN1 is LOW and WEN2/LD is HIGH and the FIFO is not Full**. When LD is asserted, WCLK writes data into the programmable flag-offset register.
RCLK	Read Clock	I	**The rising edge clocks data out of the FIFO when REN1 and REN2 are LOW and the FIFO is not Empty**. When WEN2/LD is LOW, RCLK reads data out of the programmable flag offset register.
EF	Empty Flag	O	**When EF is LOW, the FIFO is empty. EF is synchronized to RCLK**.
FF	Full Flag	O	**When FF is LOW, the FIFO is full. FF is synchronized to WCLK**.
PAE	Programmable Almost Empty	O	**When PAE is LOW, the FIFO is almost empty based on the almost empty offset value programmed into the FIFO**.
PAF	Programmable Almost Full	O	**When PAF is LOW, the FIFO is almost full based on the almost full offset value programmed into the FIFO**.
RS	Reset	I	**Resets device to empty condition**. A reset is required before an initial read or write operation after power-up.
OE	Output Enable	I	**When OE is LOW, the FIFO's data outputs drive the bus to which they are connected**. If OE is HIGH, the FIFO's outputs are in High Z (high-impedance) state.

Functional Description (continued)

The CY7C42X1V provides four status pins: Empty, Full, Almost Empty, Almost Full. The Almost Empty/Almost Full flags are programmable to single word granularity. The programmable flags default to Empty-7 and Full-7.

The flags are synchronous, i.e., they change state relative to either the Read Clock (RCLK) or the Write Clock (WCLK). When entering or exiting the Empty and Almost Empty states, the flags are updated exclusively by the RCLK. The flags denoting Almost Full and Full states are updated exclusively by WCLK. The synchronous flag architecture guarantees that the flags maintain their status for at least one cycle

All configurations are fabricated using an advanced 0.65µ P-Well CMOS technology. Input ESD protection is greater than 2001V, and latch-up is prevented by the use of guard rings.

Downloaded from Arrow.com. [+] Feedback

Architecture

The CY7C42X1V consists of an array of 64 to 8K words of nine bits each (implemented by a dual-port array of SRAM cells), a read pointer, a write pointer, control signals (RCLK, WCLK, REN1, REN2, WEN1, WEN2, RS), and flags (EF, PAE, PAF, FF.)

Resetting the FIFO

Upon power-up, the FIFO must be reset with a Reset ($\overline{RS}$) cycle. This causes the FIFO to enter the Empty condition signified by EF being LOW. All data outputs (Q_{0-8}) go LOW t_{RSF} after the rising edge of RS. In order for the FIFO to reset to its default state, a falling edge must occur on $\overline{RS}$ and the user must not read or write while $\overline{RS}$ is LOW. All flags are guaranteed to be valid t_{RSF} after $\overline{RS}$ is taken LOW.

FIFO Operation

When the $\overline{WEN1}$ signal is active LOW and WEN2 is active HIGH, data present on the D_{0-8} pins is written into the FIFO on each rising edge of the WCLK signal. Similarly, when the $\overline{REN1}$ and $\overline{REN2}$ signals are active LOW, data in the FIFO memory will be presented on the Q_{0-8} outputs. New data will be presented on each rising edge of RCLK while $\overline{REN1}$ and $\overline{REN2}$ are active. $\overline{REN1}$ and $\overline{REN2}$ must set up t_{ENS} before RCLK for it to be a valid read function. $\overline{WEN1}$ and $\overline{WEN2}$ must occur t_{ENS} before WCLK for it to be a valid write function.

An Output Enable ($\overline{OE}$) pin is provided to three-state the Q_{0-8} outputs when $\overline{OE}$ is asserted. When $\overline{OE}$ is enabled (LOW), data in the output register will be available to the Q_{0-8} outputs after t_{OE}.

The FIFO contains overflow circuitry to disallow additional writes when the FIFO is full, and underflow circuitry to disallow additional reads when the FIFO is empty. An empty FIFO maintains the data of the last valid read on its Q_{0-8} outputs even after additional reads occur.

Write Enable 1 ($\overline{WEN1}$). If the FIFO is configured for programmable flags, Write Enable 1 ($\overline{WEN1}$) is the only write enable control pin. In this configuration, when Write Enable 1 ($\overline{WEN1}$) is LOW, data can be loaded into the input register and RAM array on the LOW-to-HIGH transition of every write clock (WCLK). Data is stored is the RAM array sequentially and independently of any on-going read operation.

Write Enable 2/Load (WEN2/$\overline{LD}$). This is a dual-purpose pin. The FIFO is configured at Reset to have programmable flags or to have two write enables, which allows for depth expansion. If Write Enable 2/Load (WEN2/$\overline{LD}$) is set active HIGH at Reset ($\overline{RS}$=LOW), this pin operates as a second write enable pin.

If the FIFO is configured to have two write enables, when Write Enable ($\overline{WEN1}$) is LOW and Write Enable 2/Load (WEN2/$\overline{LD}$) is HIGH, data can be loaded into the input register and RAM array on the LOW-to-HIGH transition of every write clock (WCLK.) Data is stored in the RAM array sequentially and independently of any on-going read operation.

Programming

When WEN2/$\overline{LD}$ is held LOW during Reset, this pin is the load ($\overline{LD}$) enable for flag offset programming. In this configuration, WEN2/$\overline{LD}$ can be used to access the four 8-bit offset registers contained in the CY7C42X1V for writing or reading data to these registers.

When the device is configured for programmable flags and both WEN2/$\overline{LD}$ and $\overline{WEN1}$ are LOW, the first LOW-to-HIGH transition of WCLK writes data from the data inputs to the empty offset Least Significant Bit (LSB) register. The second, third, and fourth LOW-to-HIGH transitions of WCLK store data in the empty offset Most Significant Bit (MSB) register, full offset LSB register, and full offset MSB register, respectively, when WEN2/$\overline{LD}$ and $\overline{WEN1}$ are LOW. The fifth LOW-to-HIGH transition of WCLK while WEN2/$\overline{LD}$ and $\overline{WEN1}$ are LOW writes data to the empty LSB register again. *Figure 1* shows the register sizes and default values for the various device types.

It is not necessary to write to all the offset registers at one time. A subset of the offset registers can be written; then by bringing the WEN2/$\overline{LD}$ input HIGH, the FIFO is returned to normal read and write operation. The next time WEN2/$\overline{LD}$ is brought LOW, a write operation stores data in the next offset register in sequence.

The contents of the offset registers can be read to the data outputs when WEN2/$\overline{LD}$ is LOW and both $\overline{REN1}$ and $\overline{REN2}$ are LOW. LOW-to-HIGH transitions of RCLK read register contents to the data outputs. Writes and reads should not be performed simultaneously on the offset registers.

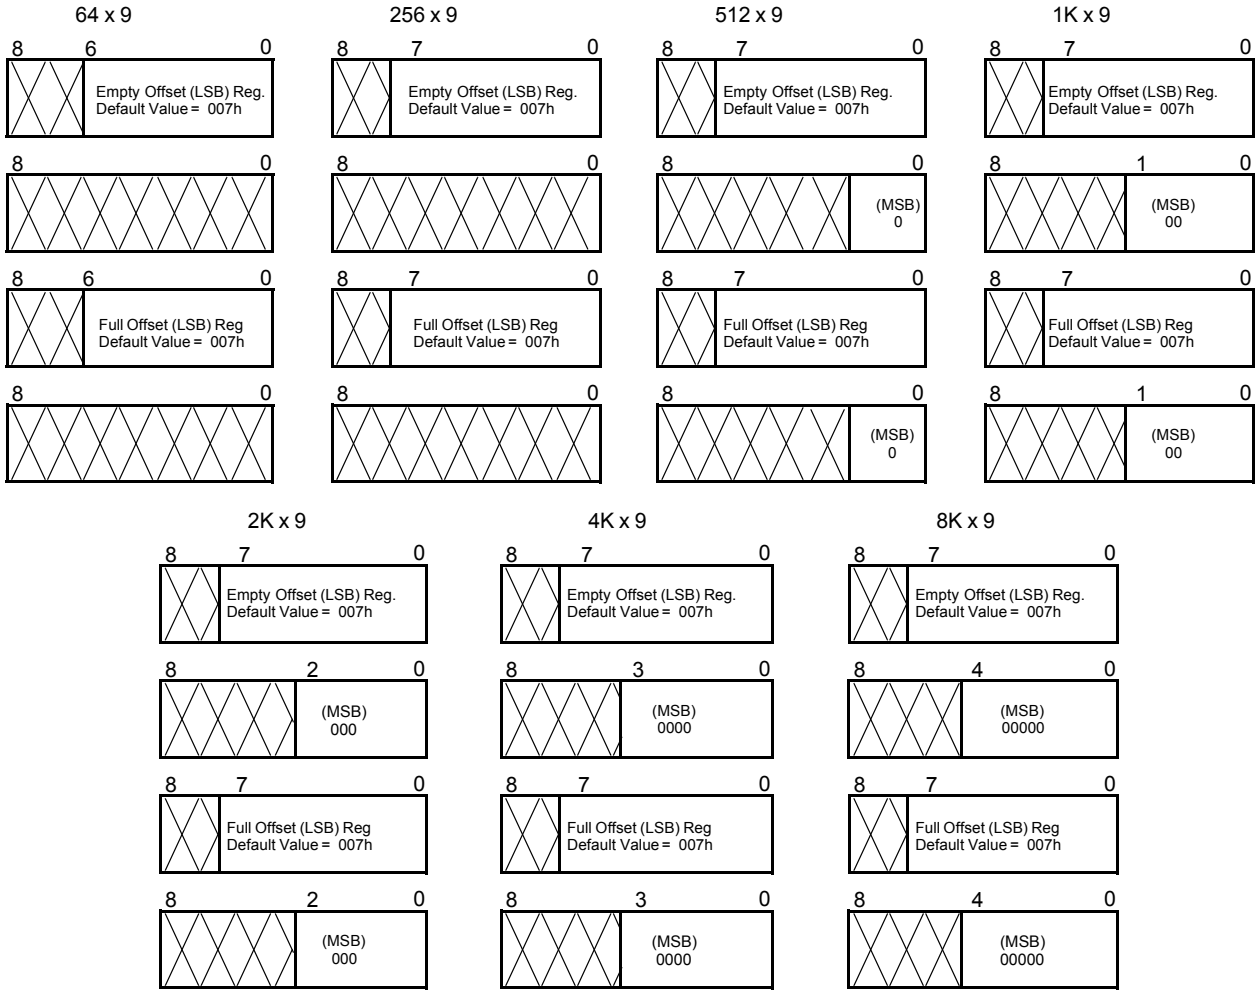

Figure 1. Offset Register Location and Default Values

Programmable Flag ($\overline{PAE}$, $\overline{PAF}$) Operation

Whether the flag offset registers are programmed as described in *Table 1* or the default values are used, the programmable Almost Empty Flag ($\overline{PAE}$) and programmable Almost Full Flag ($\overline{PAF}$) states are determined by their corresponding offset registers and the difference between the read and write pointers.

Table 1. Writing the Offset Registers

LD	WEN	WCLK[1]	Selection
0	0	↑	Empty Offset (LSB) Empty Offset (MSB) Full Offset (LSB) Full Offset (MSB)
0	1	↑	No Operation
1	0	↑	Write Into FIFO
1	1	↑	No Operation

The number formed by the empty offset least significant bit register and empty offset most significant register is referred to as *n* and determines the operation of $\overline{PAE}$. $\overline{PAE}$ is synchronized to the LOW-to-HIGH transition of RCLK by one flip-flop and is LOW when the FIFO contains n or fewer unread words. $\overline{PAE}$ is set HIGH by the LOW-to-HIGH transition of RCLK when the FIFO contains (n+1) or greater unread words.

The number formed by the full offset least significant bit register and full offset most significant bit register is referred to as *m* and determines the operation of $\overline{PAF}$. $\overline{PAE}$ is synchronized to the LOW-to-HIGH transition of WCLK by one flip-flop and is set LOW when the number of unread words in the FIFO is greater than or equal to CY7C4421V (64 – m), CY7C4201V (256 – m), CY7C4211V (512 – m), CY7C4221V (1K – m), CY7C4231V (2K – m), CY7C4241V (4K – m), and CY7C4251V (8K – m). $\overline{PAF}$ is set HIGH by the LOW-to-HIGH transition of WCLK when the number of available memory locations is greater than m.

Note:
1. The same selection sequence applies to reading from the registers. $\overline{REN1}$ and $\overline{REN2}$ are enabled and a read is performed on the LOW-to-HIGH transition of RCLK.

1024	2048	4096	8192	L	L	H	H

Width Expansion Configuration

Word width may be increased simply by connecting the corresponding input control signals of multiple devices. A composite flag should be created for each of the end-point status flags ($\overline{EF}$ and $\overline{FF}$). The partial status flags ($\overline{PAE}$ and $\overline{PAF}$) can be detected from any one device. *Figure 2* demonstrates a 18-bit word width by using two CY7C42X1Vs. Any word width can be attained by adding additional CY7C42X1Vs.

When the CY7C42X1V is in a Width Expansion Configuration, the Read Enable ($\overline{REN2}$) control input can be grounded (see *Figure 2*). In this configuration, the Write Enable 2/Load (WEN2/$\overline{LD}$) pin is set to LOW at Reset so that the pin operates as a control to load and read the programmable flag offsets.

Flag Operation

The CY7C42X1 devices provide four flag pins to indicate the condition of the FIFO contents. Empty, Full, $\overline{PAE}$, and $\overline{PAF}$ are synchronous.

Full Flag

The Full Flag ($\overline{FF}$) will go LOW when device is full. Write operations are inhibited whenever $\overline{FF}$ is LOW regardless of the state of $\overline{WEN1}$ and WEN2/$\overline{LD}$. $\overline{FF}$ is synchronized to WCLK, i.e., it is exclusively updated by each rising edge of WCLK.

Empty Flag

The Empty Flag ($\overline{EF}$) will go LOW when the device is empty. Read operations are inhibited whenever $\overline{EF}$ is LOW, regardless of the state of $\overline{REN1}$ and $\overline{REN2}$. $\overline{EF}$ is synchronized to RCLK, i.e., it is exclusively updated by each rising edge of RCLK.

Notes:
2. n = Empty Offset (n=7 default value).
3. m = Full Offset (m=7 default value).

© Cypress Semiconductor Corporation, 2005. The information contained herein is subject to change without notice. Cypress Semiconductor Corporation assumes no responsibility for the use of any circuitry other than circuitry embodied in a Cypress product. Nor does it convey or imply any license under patent or other rights. Cypress products are not warranted nor intended to be used for medical, life support, life saving, critical control or safety applications, unless pursuant to an express written agreement with Cypress. Furthermore, Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress products in life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Document Title: CY7C4421V/4201V/4211V/4221V/CY7C4231V/4241V/4251V Low-Voltage 64/256/512/1K/2K/4K/8K x 9 Synchronous FIFOs Document Number: 38-06010				
REV.	**ECN NO.**	**Issue Date**	**Orig. of Change**	**Description of Change**
**	106471	09/10/01	SZV	Change from Spec number: 38-00622 to 38-06010
*A	127857	08/25/03	FSG	Fixed empty flag timing diagram Fixed switching waveform diagram typo
*B	384573	See ECN	ESH	Added Pb-Free logo to top of front page Inserted industrial temperature range into operating range Added parts CY7C4251V-25AXC, CY7C4251V-15AXC, CY7C4241V-15AXC, CY7C4241V-15JXC, CY7C4241V-25XC, CY7C4231V-25AXC, CY7C4221V-15AI, CY7C4211V-15AXI, CY7C4201V-15AXC to ordering information.
