## Recommended Operating Conditions Driver Function

The Input/Output logic timing diagram is shown in Figure 1. For proper operation the device should be used within the recommended conditions. All voltages are absolute referenced to COM/ $I_{TRIP}$ . The  $V_S$  offset is tested with all supplies biased at 15V differential (Note 3)

Symbol	Definition	Min	Max	Units
$V_{B1,2,3}$	High side floating supply voltage	$V_S + 12$	$V_S + 20$	V
$V_{S1,2,3}$	High side floating supply offset voltage	Note 4	450	
$V_{CC}$	Low side and logic fixed supply voltage	12	20	V
$V_{ITRIP}$	$I_{TRIP}$ input voltage	$V_{SS}$	$V_{SS} + 5$	
$V_{IN}$	Logic input voltage LIN, HIN	$V_{SS}$	$V_{SS} + 5$	V
$V_{EN}$	Logic input voltage EN	$V_{SS}$	$V_{SS} + 5$	V

Note 3: For more details, see IR21363 data sheet

Note 4: Logic operational for  $V_S$  from COM-5V to COM+600V. Logic state held for  $V_S$  from COM-5V to COM- $V_{BS}$ . (please refer to DT97-3 for more details)

**Input-Output Logic Level Table**

FLT- EN	$I_{TRIP}$	$\overline{HIN1,2,3}$	$\overline{LIN1,2,3}$	U,V,W
1	0	0	1	$V^+$
1	0	1	0	0
1	0	1	1	Off
1	1	X	X	Off
0	X	X	X	Off

Sequence of events:

- 1-2) Current begins to rise
- 2) Current reaches  $I_{\text{BUS\_Trip}}$  level
- 2-3) Current is higher than  $I_{\text{BUS\_Trip}}$  for at least  $6\mu\text{s}$ . This value is the worst-case condition with very low over-current. In case of high current (short circuit), the actual delay will be smaller.
- 3-4) Delay between driver identification of over-current condition and disabling of all outputs
- 4) Current starts decreasing, eventually reaching 0
- 5) Current goes below  $I_{\text{BUS\_Trip}}$ , the driver starts its auto-reset sequence
- 6) Driver is automatically reset and normal operation can resume (over-current condition must be removed by the time the drivers automatically resets itself)

Figure 2.  $I_{\text{Trip}}$  Timing Waveform

Note 5: The shaded area indicates that both high-side and low-side switches are off and therefore the half-bridge output voltage would be determined by the direction of current flow in the load.

## Typical Application Connection IRAMS10UP60B

1. Electrolytic bus capacitors should be mounted as close to the module bus terminals as possible to reduce ringing and EMI problems. Additional high frequency ceramic capacitor mounted close to the module pins will further improve performance.
2. In order to provide good decoupling between  $V_{CC}$ - $V_{SS}$  and  $V_{B1,2,3}$ - $V_{S1,2,3}$  terminals, the capacitors shown connected between these terminals should be located very close to the module pins. Additional high frequency capacitors, typically  $0.1\mu F$ , are strongly recommended.
3. Value of the boot-strap capacitors depends upon the switching frequency. Their selection should be made based on IR design tip DN 98-2a, application note AN-1044 or Figure 9. Bootstrap capacitor value must be selected to limit the power dissipation of the internal resistor in series with the  $V_{CC}$ . (see maximum ratings Table on page 3).
4. Current sense signal can be obtained from pin 22 and pin 23. Care should be taken to avoid having inverter current flowing through pin 22 to maintain required current measurement accuracy.
5. After approx. 8ms the FAULT is reset. (see Dynamic Characteristics Table on page 5).
6. PWM generator must be disabled within Fault duration to guarantee shutdown of the system, overcurrent condition must be cleared before resuming operation.
7.  $\overline{\text{Fault/Enable}}$  pin must be pulled-up to +5V.
