# 1. Introduction

The LA-MachXO automotive device family is optimized to meet the requirements of applications traditionally addressed by CPLDs and low capacity FPGAs: glue logic, bus bridging, bus interfacing, power-up control, and control logic. These devices bring together the best features of CPLD and FPGA devices on a single chip in AEC-Q100 tested and qualified versions.

The devices use look-up tables (LUTs) and embedded block memories traditionally associated with FPGAs for flexible and efficient logic implementation. Through nonvolatile technology, the devices provide the single-chip, high-security, instant-on capabilities traditionally associated with CPLDs. Finally, advanced process technology and careful design will provide the high pin-to-pin performance also associated with CPLDs.

The ispLEVER® design tools from Lattice allow complex designs to be efficiently implemented using the LAMachXO automotive family of devices. Popular logic synthesis tools provide synthesis library support for LAMachXO. The ispLEVER tools use the synthesis tool output along with the constraints from its floor planning tools to place and route the design in the LA-MachXO device. The ispLEVER tool extracts the timing from the routing and back-annotates it into the design for timing verification.

# 2. Features

- Non-volatile, Infinitely Reconfigurable
  - Instant-on – powers up in microseconds
  - Single chip, no external configuration memory required
  - Excellent design security, no bit stream to intercept
  - Reconfigure SRAM based logic in milliseconds
  - SRAM and non-volatile memory programmable through JTAG port
  - Supports background programming of non-volatile memory
- AEC-Q100 Tested and Qualified
- Sleep Mode
  - Allows up to 100x static current reduction
- TransFR™ Reconfiguration (TFR)
  - In-field logic update while system operates
- High I/O to Logic Density
  - 256 to 2280 LUT4s
  - 73 to 271 I/Os with extensive package options
  - Density migration supported
  - Lead free/RoHS compliant packaging
- Embedded and Distributed Memory
  - Up to 27.6 Kbits sysMEM™ Embedded Block RAM
  - Up to 7.5 Kbits distributed RAM
  - Dedicated FIFO control logic
- Flexible I/O Buffer
- Programmable sysIO™ buffer supports wide range of interfaces:
  - LVCMOS 3.3/2.5/1.8/1.5/1.2
  - LVTTTL
  - PCI
  - LVDS, Bus-LVDS, LVPECL, RSDS

- sysCLOCK™ PLLs
  - Up to two analog PLLs per device
  - Clock multiply, divide, and phase shifting
- System Level Support
  - IEEE Standard 1149.1 Boundary Scan
  - Onboard oscillator
  - Devices operate with 3.3 V, 2.5 V, 1.8V or 1.2 V power supply
  - IEEE 1532 compliant in-system programming

## 3. Architecture

### 3.1. Architecture Overview

The LA-MachXO family architecture contains an array of logic blocks surrounded by Programmable I/O (PIO). Some devices in this family have sysCLOCK PLLs and blocks of sysMEM™ Embedded Block RAM (EBRs). [Figure 3.1.](#), [Figure 3.2.](#), and [Figure 3.3.](#) show the block diagrams of the various family members.

The logic blocks are arranged in a two-dimensional grid with rows and columns. The EBR blocks are arranged in a column to the left of the logic array. The PIO cells are located at the periphery of the device, arranged into Banks. The PIOs utilize a flexible I/O buffer referred to as a sysIO interface that supports operation with a variety of interface standards. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

There are two kinds of logic blocks, the Programmable Functional Unit (PFU) and the Programmable Functional unit without RAM (PFF). The PFU contains the building blocks for logic, arithmetic, RAM, ROM, and register functions. The PFF block contains building blocks for logic, arithmetic, ROM, and register functions. Both the PFU and PFF blocks are optimized for flexibility, allowing complex designs to be implemented quickly and effectively. Logic blocks are arranged in a two-dimensional array. Only one type of block is used per row.

In the LA-MachXO family, the number of sysIO Banks varies by device. There are different types of I/O Buffers on different Banks. See the details in later sections of this document. The sysMEM EBRs are large, dedicated fast memory blocks; these blocks are found only in the larger devices. These blocks can be configured as RAM, ROM or FIFO. FIFO support includes dedicated FIFO pointer and flag “hard” control logic to minimize LUT use.

The LA-MachXO architecture provides up to two sysCLOCK™ Phase Locked Loop (PLL) blocks on larger devices. These blocks are located at either end of the memory blocks. The PLLs have multiply, divide, and phase shifting capabilities that are used to manage the frequency and phase relationships of the clocks.

Every device in the family has a JTAG Port that supports programming and configuration of the device as well as access to the user logic. The LA-MachXO devices are available for operation from 3.3 V, 2.5 V, 1.8 V, and 1.2 V power supplies, providing easy integration into the overall system.

1. Top view of the LA-MachXO2280 device is similar but with higher LUT count, two PLLs, and three EBR blocks.

**Figure 3.1. Top View of the LA-MachXO1200 Device<sup>1</sup>**

**Figure 3.2. Top View of the LA-MachXO640 Device**

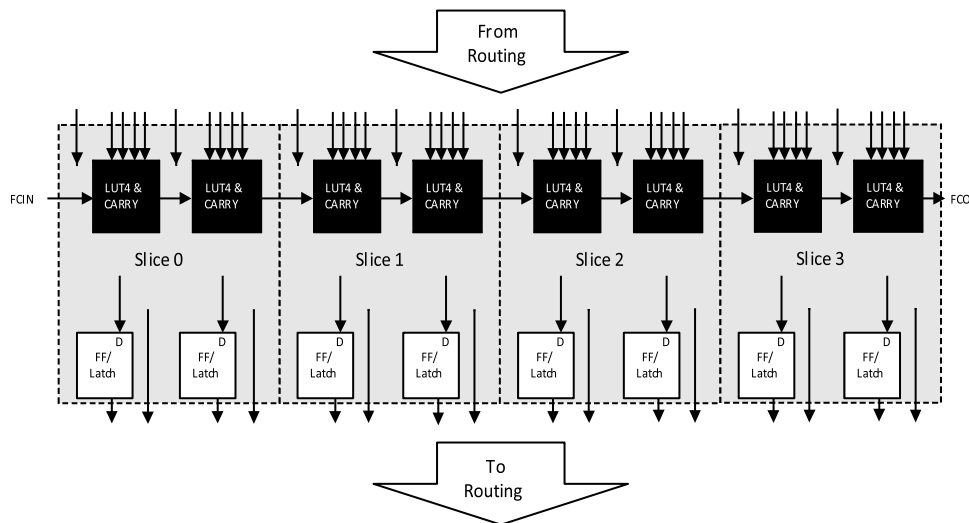

**Figure 3.3. Top View of the LA-MachXO256 Device**

### 3.1.1. PFU Blocks

The core of the LA-MachXO devices consists of PFU and PFF blocks. The PFUs can be programmed to perform Logic, Arithmetic, Distributed RAM, and Distributed ROM functions. PFF blocks can be programmed to perform Logic, Arithmetic, and Distributed ROM functions. Except where necessary, the remainder of this data sheet will use the term PFU to refer to both PFU and PFF blocks.

Each PFU block consists of four interconnected Slices, numbered 0-3 as shown in Figure 3.4. There are 53 inputs and 25 outputs associated with each PFU block.

**Figure 3.4. PFU Diagram**

### 3.1.2. Slice

Each Slice contains two LUT4 lookup tables feeding two registers (programmed to be in FF or Latch mode), and some associated logic that allows the LUTs to be combined to perform functions such as LUT5, LUT6, LUT7, and LUT8. There is control logic to perform set/reset functions (programmable as synchronous/asynchronous), clock select, chip-select, and wider RAM/ROM functions. [Figure 3.5.](#) shows an overview of the internal logic of the Slice. The registers in the Slice can be configured for positive/negative and edge/level clocks.

There are 14 input signals: 13 signals from routing and one from the carry-chain (from the adjacent Slice/PFU). There are 7 outputs: 6 to the routing and one to the carry-chain (to the adjacent Slice/PFU). [Table 3.1.](#) lists the signals associated with each Slice.

**Figure 3.5. Slice Diagram**

**Table 3.1. Slice Signal Descriptions**

Function	Type	Signal Names	Description
Input	Data signal	A0, B0, C0, D0	Inputs to LUT4
Input	Data signal	A1, B1, C1, D1	Inputs to LUT4
Input	Multi-purpose	M0/M1	Multipurpose Input
Input	Control signal	CE	Clock Enable
Input	Control signal	LSR	Local Set/Reset
Input	Control signal	CLK	System Clock
Input	Inter-PFU signal	FCIN	Fast Carry In <sup>1</sup>
Output	Data signals	F0, F1	LUT4 output register bypass signals
Output	Data signals	Q0, Q1	Register Outputs
Output	Data signals	OFX0	Output of a LUT5 MUX
Output	Data signals	OFX1	Output of a LUT6, LUT7, LUT8 <sup>2</sup> MUX depending on the Slice
Output	Inter-PFU signal	FCO	Fast Carry Out <sup>1</sup>

**Notes:**

1. See Figure 3.4. for connection details.
2. Requires two PFUs.

## Modes of Operation

Each Slice is capable of four modes of operation: Logic, Ripple, RAM, and ROM. The Slice in the PFF is capable of all modes except RAM. Table 3.2. lists the modes and the capability of the Slice blocks.

**Table 3.2. Slice Modes**

	Logic	Ripple	RAM	ROM
PFU Slice	LUT 4x2 or LUT 5x1	2-bit Arithmetic Unit	SP 16x2	ROM 16x1 x 2
PFF Slice	LUT 4x2 or LUT 5x1	2-bit Arithmetic Unit	N/A	ROM 16x1 x 2

### Logic Mode:

In this mode, the LUTs in each Slice are configured as 4-input combinatorial lookup tables (LUT4). A LUT4 can have 16 possible input combinations. Any logic function with four inputs can be generated by programming this lookup table. Since there are two LUT4s per Slice, a LUT5 can be constructed within one Slice. Larger lookup tables such as LUT6, LUT7, and LUT8 can be constructed by concatenating other Slices.

**Ripple Mode:** Ripple mode allows the efficient implementation of small arithmetic functions. In ripple mode, the following functions can be implemented by each Slice:

- Addition 2-bit
- Subtraction 2-bit
- Add/Subtract 2-bit using dynamic control
- Up counter 2-bit
- Down counter 2-bit
- Ripple mode multiplier building block
- Comparator functions of A and B inputs
  - A greater-than-or-equal-to B
  - A not-equal-to B
  - A less-than-or-equal-to B

Two additional signals, Carry Generate and Carry Propagate, are generated per Slice in this mode, allowing fast arithmetic functions to be constructed by concatenating Slices.

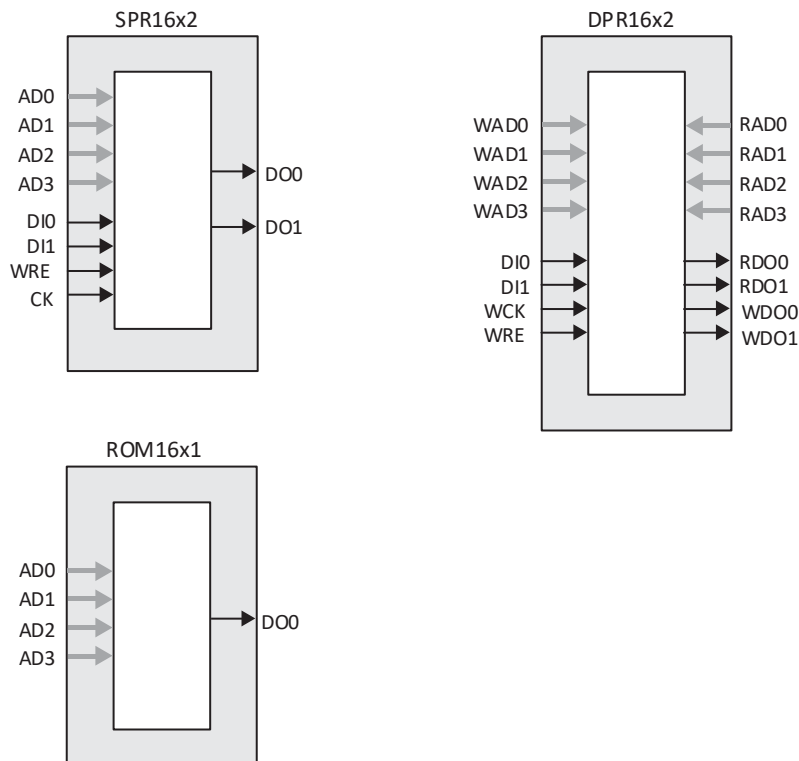

**RAM Mode:** In this mode, distributed RAM can be constructed using each LUT block as a 16x2-bit memory. Through the combination of LUTs and Slices, a variety of different memories can be constructed.

The ispLEVER design tool supports the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the PFU. Table 3.3. shows the number of Slices required to implement different distributed RAM primitives. Figure 3.6. shows the distributed memory primitive block diagrams. Dual port memories involve the pairing of two Slices. One Slice functions as the read-write port, while the other companion Slice supports the read-only port. For more information on RAM mode in LA-MachXO devices, please see details of additional technical documentation at the end of this data sheet.

**Table 3.3. Number of Slices Required For Implementing Distributed RAM**

	SPR16x2	DPR16x2
Number of Slices	1	2

**Note:** SPR = Single Port RAM, DPR = Dual Port RAM

**Figure 3.6. Distributed Memory Primitives**

#### ROM Mode:

The ROM mode uses the same principal as the RAM modes, but without the Write port. Pre-loading is accomplished through the programming interface during configuration.

#### PFU Modes of Operation

Slices can be combined within a PFU to form larger functions. Table 3.7. tabulates these modes and documents the functionality possible at the PFU level.

**Table 3.4. PFU Modes of Operation**

Logic	Ripple	RAM	ROM
LUT 4x8 or MUX 2x1 x 8	2-bit Add x 4	SPR16x2 x 4 DPR16x2 x 2	ROM16x1 x 8
LUT 5x4 or MUX 4x1 x 4	2-bit Sub x 4	SPR16x4 x 2 DPR16x4 x 1	ROM16x2 x 4
LUT 6x2 or MUX 8x1 x 2	2-bit Counter x 4	SPR16x8 x 1	ROM16x4 x 2
LUT 7x1 or MUX 16x1 x 1	2-bit Comp x 4		ROM16x8 x 1

### 3.1.3. Routing

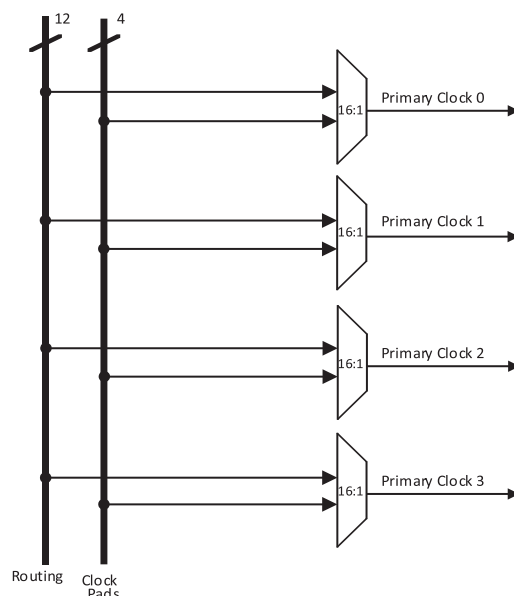

There are many resources provided in the LA-MachXO devices to route signals individually or as buses with related control signals. The routing resources consist of switching circuitry, buffers and metal interconnect (routing) segments.

The inter-PFU connections are made with three different types of routing resources: x1 (spans two PFUs), x2 (spans three PFUs) and x6 (spans seven PFUs). The x1, x2, and x6 connections provide fast and efficient connections in the horizontal and vertical directions.

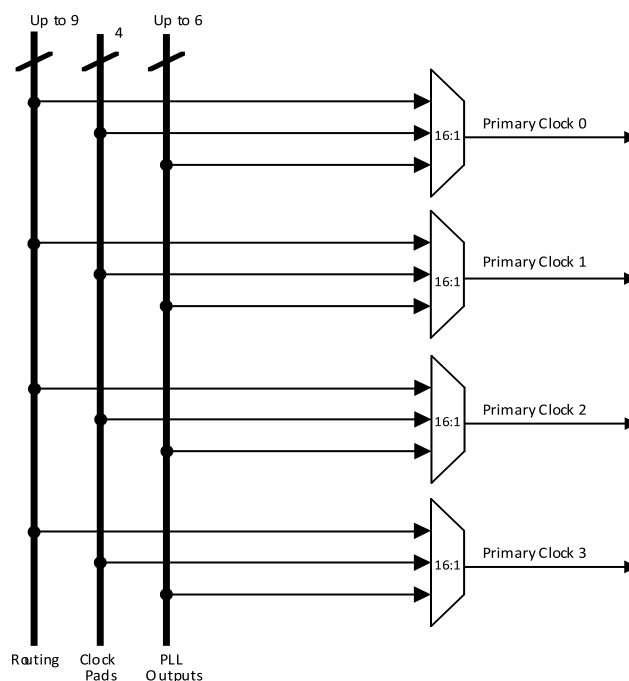

The ispLEVER design tool takes the output of the synthesis tool and places and routes the design. Generally, the place and route tool is completely automatic, although an interactive routing editor is available to optimize the design.

## 3.2. Clock/Control Distribution Network

The LA-MachXO automotive family of devices provides global signals that are available to all PFUs. These signals consist of four primary clocks and four secondary clocks. Primary clock signals are generated from four 16:1 muxes as shown in Figure 3.7. and Figure 3.8. The available clock sources for the LA-MachXO256 and LA-MachXO640 devices are four dual function clock pins and 12 internal routing signals. The available clock sources for the LAMachXO1200 and LA-MachXO2280 devices are four dual function clock pins, up to nine internal routing signals and up to six PLL outputs.

**Figure 3.7. Primary Clocks for LA-MachXO256 and LA-MachXO640 Devices**

**Figure 3.8. Primary Clocks for LA-MachXO1200 and LA-MachXO2280 Devices**

Four secondary clocks are generated from four 16:1 muxes as shown in Figure 3.9. Four of the secondary clock sources come from dual function clock pins and 12 come from internal routing.

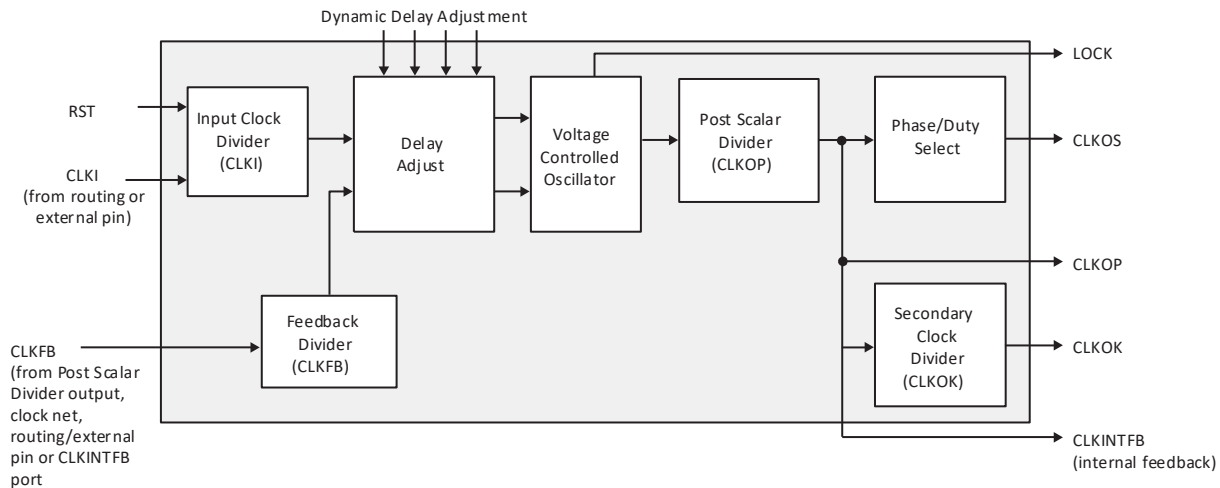

**Figure 3.9. Secondary Clocks for LA-MachXO Devices**

### 3.2.1. sysCLOCK Phase Locked Loops (PLLs)

The LA-MachXO1200 and LA-MachXO2280 provide PLL support. The source of the PLL input divider can come from an external pin or from internal routing. There are four sources of feedback signals to the feedback divider: from CLKINTFB (internal feedback port), from the global clock nets, from the output of the post scalar divider, and from the routing (or from an external pin). There is a PLL\_LOCK signal to indicate that the PLL has locked on to the input clock signal. Figure 3.10 shows the sysCLOCK PLL diagram.

The setup and hold times of the device can be improved by programming a delay in the feedback or input path of the PLL which will advance or delay the output clock with reference to the input clock. This delay can be either programmed during configuration or can be adjusted dynamically. In dynamic mode, the PLL may lose lock after adjustment and not relock until the  $t_{LOCK}$  parameter has been satisfied. Additionally, the phase and duty cycle block allows the user to adjust the phase and duty cycle of the CLKOS output.

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. Each PLL has four dividers associated with it: input clock divider, feedback divider, post scalar divider, and secondary clock divider. The input clock divider is used to divide the input clock signal, while the feedback divider is used to multiply the input clock signal. The post scalar divider allows the VCO to operate at higher frequencies than the clock output, thereby increasing the frequency range. The secondary divider is used to derive lower frequency outputs.

**Figure 3.10. PLL Diagram**

Figure 3.11. shows the available macros for the PLL. Table 3.5. provides signal description of the PLL Block.

**Figure 3.11. PLL Primitive**

**Table 3.5. PLL Signal Descriptions**

Signal	I/O	Description
CLKI	I	Clock input from external pin or routing
CLKFB	I	PLL feedback input from PLL output, clock net, routing/external pin or internal feedback from CLKINTFB port
RST	I	"1" to reset the input clock divider
CLKOS	O	PLL output clock to clock tree (phase shifted/duty cycle changed)
CLKOP	O	PLL output clock to clock tree (No phase shift)
CLKOK	O	PLL output to clock tree through secondary clock divider
LOCK	O	"1" indicates PLL LOCK to CLKI
CLKINTFB	O	Internal feedback source, CLKOP divider output before CLOKCTREE
DDAMODE	I	Dynamic Delay Enable. "1": Pin control (dynamic), "0": Fuse Control (static)
DDAIZR	I	Dynamic Delay Zero. "1": delay = 0, "0": delay = on
DDAILAG	I	Dynamic Delay Lag/Lead. "1": Lag, "0": Lead
DDAIDEL[2:0]	I	Dynamic Delay Input

For more information on the PLL, please see details of additional technical documentation at the end of this data sheet.

### 3.3. sysMEM Memory

The LA-MachXO1200 and LA-MachXO2280 devices contain sysMEM Embedded Block RAMs (EBRs). The EBR consists of a 9-Kbit RAM, with dedicated input and output registers.

#### sysMEM Memory Block

The sysMEM block can implement single port, dual port, pseudo dual port, or FIFO memories. Each block can be used in a variety of depths and widths as shown in [Table 3.6](#).

**Table 3.6. sysMEM Block Configurations**

Memory Mode	Configurations
Single Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18 256 x 36
True Dual Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18
Pseudo Dual Port	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18 256 x 36
FIFO	8,192 x 1 4,096 x 2 2,048 x 4 1,024 x 9 512 x 18 256 x 36

#### Bus Size Matching

All of the multi-port memory modes support different widths on each of the ports. The RAM bits are mapped LSB word 0 to MSB word 0, LSB word 1 to MSB word 1 and so on. Although the word size and number of words for each port varies, this mapping scheme applies to each port.

#### RAM Initialization and ROM Operation

If desired, the contents of the RAM can be pre-loaded during device configuration. By preloading the RAM block during the chip configuration cycle and disabling the write controls, the sysMEM block can also be utilized as a ROM.

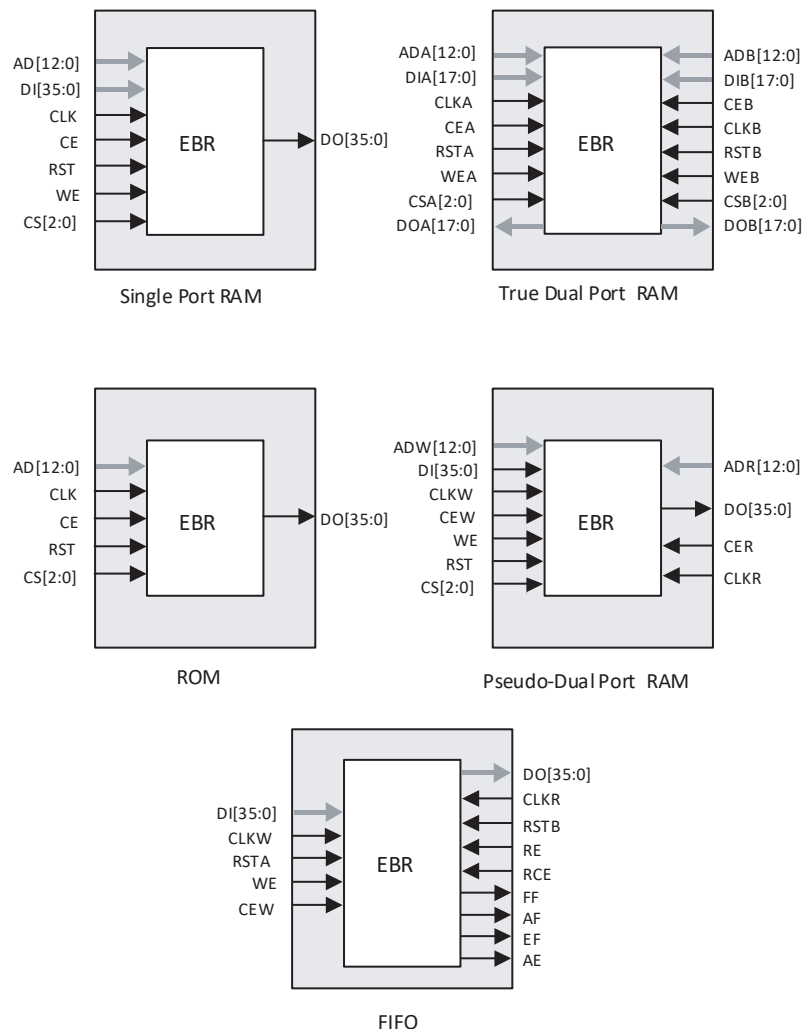

#### Memory Cascading

Larger and deeper blocks of RAMs can be created using EBR sysMEM Blocks. Typically, the Lattice design tools cascade memory transparently, based on specific design inputs.

#### Single, Dual, Pseudo-Dual Port and FIFO Modes

[Figure 3.12](#) shows the five basic memory configurations and their input/output names. In all the sysMEM RAM modes, the input data and address for the ports are registered at the input of the memory array. The output data of the memory is optionally registered at the memory array output.

**Figure 3.12. sysMEM Memory Primitives**

The EBR memory supports three forms of write behavior for single or dual port operation:

1. **Normal** – data on the output appears only during the read cycle. During a write cycle, the data (at the current address) does not appear on the output. This mode is supported for all data widths.
2. **Write Through** – a copy of the input data appears at the output of the same port. This mode is supported for all data widths.
3. **Read-Before-Write** – when new data is being written, the old contents of the address appears at the output. This mode is supported for x9, x18 and x36 data widths.

#### FIFO Configuration

The FIFO has a write port with Data-in, CEW, WE and CLKW signals. There is a separate read port with Data-out, RCE, RE and CLKR signals. The FIFO internally generates Almost Full, Full, Almost Empty and Empty Flags. The Full and Almost Full flags are registered with CLKW. The Empty and Almost Empty flags are registered with CLKR. The range of programming values for these flags are in [Table 3.7](#).

**Table 3.7. sysMEM Block Configurations**

Flag Name	Programming Range
Full (FF)	1 to (up to $2^N-1$ )
Almost Full (AF)	1 to Full-1
Almost Empty (AE)	1 to Full-1
Empty (EF)	0

**Note:** N = Address bit width

The FIFO state machine supports two types of reset signals: RSTA and RSTB. The RSTA signal is a global reset that clears the contents of the FIFO by resetting the read/write pointer and puts the FIFO flags in their initial reset state. The RSTB signal is used to reset the read pointer. The purpose of this reset is to retransmit the data that is in the FIFO. In these applications it is important to keep careful track of when a packet is written into or read from the FIFO.

### Memory Core Reset

The memory array in the EBR utilizes latches at the A and B output ports. These latches can be reset asynchronously. RSTA and RSTB are local signals, which reset the output latches associated with Port A and Port B respectively. The Global Reset (GSRN) signal resets both ports. The output data latches and associated resets for both ports are as shown in Figure 3.13.

**Figure 3.13. Memory Core Reset**

For further information on the sysMEM EBR block, see the details of additional technical documentation at the end of this data sheet.

### EBR Asynchronous Reset

EBR asynchronous reset or GSR (if used) can only be applied if all clock enables are low for a clock cycle before the reset is applied and released a clock cycle after the reset is released, as shown in Figure 3.14. The GSR input to the EBR is always asynchronous.

**Figure 3.14. EBR Asynchronous Reset (Including GSR) Timing Diagram**

If all clock enables remain enabled, the EBR asynchronous reset or GSR may only be applied and released after the EBR read and write clock inputs are in a steady state condition for a minimum of  $1/f_{MAX}$  (EBR clock). The reset release must adhere to the EBR synchronous reset setup time before the next active read or write clock edge.

If an EBR is pre-loaded during configuration, the GSR input must be disabled or the release of the GSR during device Wake Up must occur before the release of the device I/Os becoming active.

These instructions apply to all EBR RAM, ROM and FIFO implementations. For the EBR FIFO mode, the GSR signal is always enabled and the WE and RE signals act like the clock enable signals in Figure 3.14. The reset timing rules apply to the RPRreset input vs the RE input and the RST input vs. the WE and RE inputs. Both RST and RPRreset are always asynchronous EBR inputs.

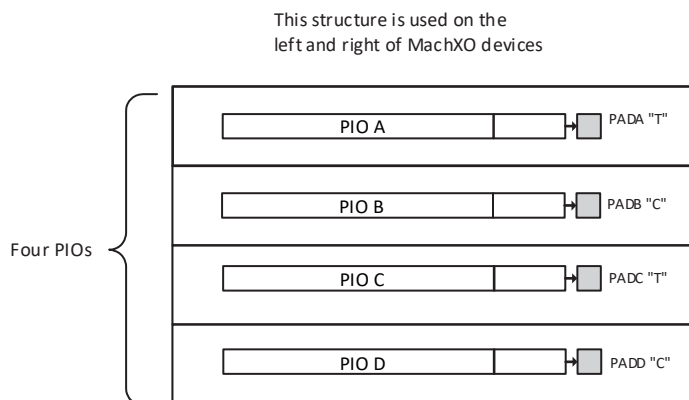

Note that there are no reset restrictions if the EBR synchronous reset is used and the EBR GSR input is disabled.

### 3.4. PIO Groups

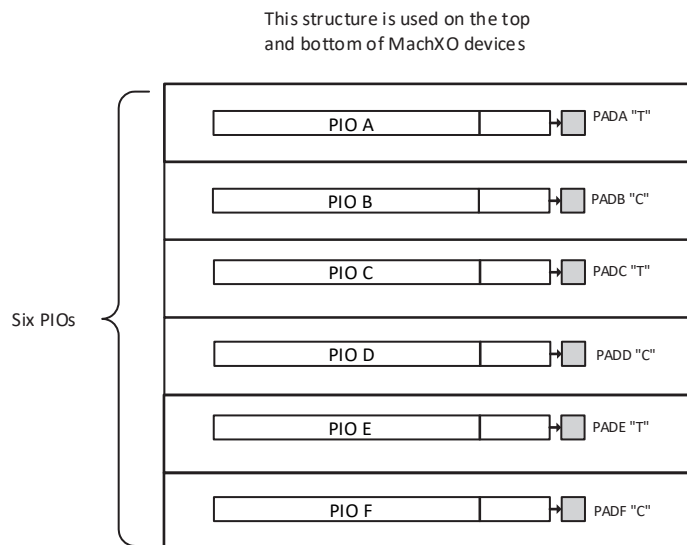

On the LA-MachXO devices, PIO cells are assembled into two different types of PIO groups, those with four PIO cells and those with six PIO cells. PIO groups with four IOs are placed on the left and right sides of the device while PIO groups with six IOs are placed on the top and bottom. The individual PIO cells are connected to their respective sysIO buffers and PADs.

On all LA-MachXO devices, two adjacent PIOs can be joined to provide a complementary Output driver pair. The I/O pin pairs are labeled as "T" and "C" to distinguish between the true and complement pins.

The LA-MachXO1200 and LA-MachXO2280 devices contain enhanced I/O capability. All PIO pairs on these larger devices can implement differential receivers. In addition, half of the PIO pairs on the left and right sides of these devices can be configured as LVDS transmit/receive pairs. PIOs on the top of these larger devices also provide PCI support.

**Figure 3.15. Group of Four Programmable I/O Cells**

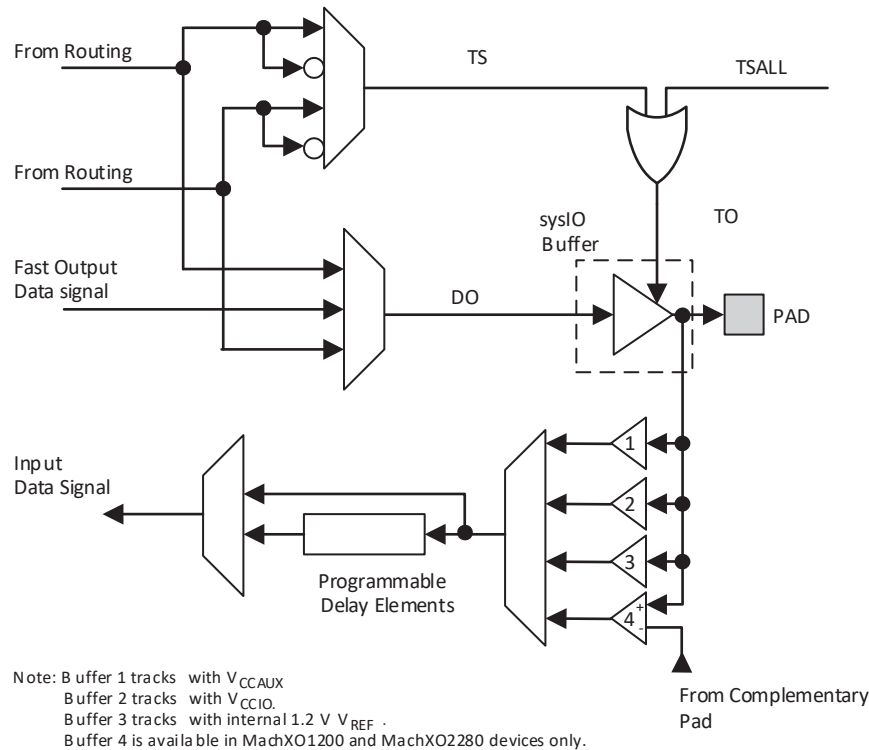

**Figure 3.16. Group of Six Programmable I/O Cells**

### 3.4.1. PIO

The PIO blocks provide the interface between the sysIO buffers and the internal PFU array blocks. These blocks receive output data from the PFU array and a fast output data signal from adjacent PFUs. The output data and fast output data signals are multiplexed and provide a single signal to the I/O pin via the sysIO buffer. [Figure 3.17.](#) shows the LA-MachXO PIO logic.

The tristate control signal is multiplexed from the output data signals and their complements. In addition a global signal (TSALL) from a dedicated pad can be used to tristate the sysIO buffer.

The PIO receives an input signal from the pin via the sysIO buffer and provides this signal to the core of the device. In addition there are programmable elements that can be utilized by the design tools to avoid positive hold times.

**Figure 3.17. LA-MachXO PIO Block Diagram**

### 3.5. sysIO Buffer

Each I/O is associated with a flexible buffer referred to as a sysIO buffer. These buffers are arranged around the periphery of the device in groups referred to as Banks. The sysIO buffers allow users to implement the wide variety of standards that are found in today's systems including LVCMOS, TTL, BLVDS, LVDS and LVPECL.

In the LA-MachXO devices, single-ended output buffers and ratioed input buffers (LVTTL, LVCMOS and PCI) are powered using  $V_{CCIO}$ . In addition to the Bank  $V_{CCIO}$  supplies, the LA-MachXO devices have a  $V_{CC}$  core logic power supply, and a  $V_{CCAUX}$  supply that powers up a variety of internal circuits including all the differential and referenced input buffers.

LA-MachXO256 and LA-MachXO640 devices contain single-ended input buffers and single-ended output buffers with complementary outputs on all the I/O Banks.

LA-MachXO1200 and LA-MachXO2280 devices contain two types of sysIO buffer pairs.

#### 1. Top and Bottom sysIO Buffer Pairs

The sysIO buffer pairs in the top and bottom Banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (for ratioed or absolute input levels). The I/O pairs on the top and bottom of the devices also support differential input buffers. PCI clamps are available on the top Bank I/O buffers. The PCI clamp is enabled after  $V_{CC}$ ,  $V_{CCAUX}$ , and  $V_{CCIO}$  are at valid operating levels and the device has been configured.

The two pads in the pair are described as "true" and "comp", where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

## 2. Left and Right sysIO Buffer Pairs

The sysIO buffer pairs in the left and right Banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (supporting ratioed and absolute input levels). The devices also have a differential driver per output pair. The referenced input buffer can also be configured as a differential input buffer. In these Banks the two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential I/O, and the comp (complementary) pad is associated with the negative side of the differential I/O.

### Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when  $V_{CC}$  and  $V_{CCAUX}$  have reached satisfactory levels. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user's responsibility to ensure that all  $V_{CCIO}$  Banks are active with valid input logic levels to properly control the output logic states of all the I/O Banks that are critical to the application. The default configuration of the I/O pins in a blank device is tri-state with a weak pull-up to  $V_{CCIO}$ . The I/O pins will maintain the blank configuration until  $V_{CC}$ ,  $V_{CCAUX}$  and  $V_{CCIO}$  have reached satisfactory levels at which time the I/Os will take on the user-configured settings.

The  $V_{CC}$  and  $V_{CCAUX}$  supply the power to the FPGA core fabric, whereas the  $V_{CCIO}$  supplies power to the I/O buffers. In order to simplify system design while providing consistent and predictable I/O behavior, the I/O buffers should be powered up along with the FPGA core fabric. Therefore,  $V_{CCIO}$  supplies should be powered up before or together with the  $V_{CC}$  and  $V_{CCAUX}$  supplies

### Supported Standards

The LA-MachXO sysIO buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVCMOS and LVTTTL. The buffer supports the LVTTTL, LVCMOS 1.2, 1.5, 1.8, 2.5, and 3.3 V standards. In the LVCMOS and LVTTTL modes, the buffer has individually configurable options for drive strength, bus maintenance (weak pull-up, weak pull-down, bus-keeper latch or none) and open drain. BLVDS and LVPECL output emulation is supported on all devices. The LA-MachXO1200 and LA-MachXO2280 support on-chip LVDS output buffers on approximately 50% of the I/Os on the left and right Banks. Differential receivers for LVDS, BLVDS and LVPECL are supported on all Banks of LA-MachXO1200 and LA-MachXO2280 devices. PCI support is provided in the top Banks of the LA-MachXO1200 and LA-MachXO2280 devices. Table 3.8. summarizes the I/O characteristics of the devices in the LA-MachXO family.

Table 3.9. and Table 3.10. show the I/O standards (together with their supply and reference voltages) supported by the LA-MachXO devices. For further information on utilizing the sysIO buffer to support a variety of standards please see the details of additional technical documentation at the end of this data sheet.

**Table 3.8. I/O Support Device by Device**

	LA-MachXO256	LA-MachXO640	LA-MachXO1200	LA-MachXO2280
Number of I/O Banks	2	4	8	8
Type of Input Buffers	Single-ended (all I/O Banks)	Single-ended (all I/O Banks)	Single-ended (all I/O Banks) Differential Receivers (all I/O Banks)	Single-ended (all I/O Banks) Differential Receivers (all I/O Banks)
Types of Output Buffers	Single-ended buffers with complementary outputs (all I/O Banks)	Single-ended buffers with complementary outputs (all I/O Banks)	Single-ended buffers with complementary outputs (all I/O Banks) Differential buffers with true LVDS outputs (50% on left and right side)	Single-ended buffers with complementary outputs (all I/O Banks) Differential buffers with true LVDS outputs (50% on left and right side)
Differential Output Emulation Capability	All I/O Banks	All I/O Banks	All I/O Banks	All I/O Banks
PCI Support	No	No	Top side only	Top side only

**Table 3.9. Supported Input Standards**

Input Standard	VCCIO (Typ.)				
	3.3V	2.5V	1.8V	1.5V	1.2V
<b>Single Ended Interfaces</b>					
LVTTTL	√	√	√	√	√
LVC MOS33	√	√	√	√	√
LVC MOS25	√	√	√	√	√
LVC MOS18			√		
LVC MOS15				√	
LVC MOS12	√	√	√	√	√
PCI <sup>1</sup>	√				
<b>Differential Interfaces</b>					
BLVDS <sup>2</sup> , LVDS <sup>2</sup> , LVPECL <sup>2</sup> , RSDS <sup>2</sup>	√	√	√	√	√

**Notes:**

1. Top Banks of LA-MachXO1200 and LA-MachXO2280 devices only.
2. LA-MachXO1200 and LA-MachXO2280 devices only.

**Table 3.10. Supported Output Standards**

Output Standard	Drive	V <sub>CCIO</sub> (Typ.)
<b>Single-ended Interfaces</b>		
LVTTTL	4 mA, 8 mA, 12 mA, 16 mA	3.3
LVC MOS33	4 mA, 8 mA, 12 mA, 14 mA	3.3
LVC MOS25	4 mA, 8 mA, 12 mA, 14 mA	2.5
LVC MOS18	4 mA, 8 mA, 12 mA, 14 mA	1.8
LVC MOS15	4 mA, 8 mA	1.5
LVC MOS12	2 mA, 6 mA	1.2
LVC MOS33, Open Drain	4 mA, 8 mA, 12 mA, 14 mA	—
LVC MOS25, Open Drain	4 mA, 8 mA, 12 mA, 14 mA	—
LVC MOS18, Open Drain	4 mA, 8 mA, 12 mA, 14 mA	—
LVC MOS15, Open Drain	4 mA, 8 mA	—
LVC MOS12, Open Drain	2 mA, 6 mA	—
PCI33 <sup>3</sup>	N/A	3.3
<b>Differential Interfaces</b>		
LVDS <sup>1, 2</sup>	N/A	2.5
BLVDS, RSDS <sup>2</sup>	N/A	2.5
LVPECL <sup>2</sup>	N/A	3.3

**Notes:**

1. LA-MachXO1200 and LA-MachXO2280 devices have dedicated LVDS buffers.
2. These interfaces can be emulated with external resistors in all devices.
3. Top Banks of LA-MachXO1200 and LA-MachXO2280 devices only.

### 3.5.1. sysIO Buffer Banks

The number of Banks vary between the devices of this family. Eight Banks surround the two larger devices, the LAMachXO1200 and LA-MachXO2280 (two Banks per side). The LA-MachXO640 has four Banks (one Bank per side). The smallest member of this family, the LA-MachXO256, has only two Banks.

Each sysIO buffer Bank is capable of supporting multiple I/O standards. Each Bank has its own I/O supply voltage (VCCIO) which allows it to be completely independent from the other Banks. [Figure 3.18.](#), [Figure 3.19.](#), [Figure 3.20.](#) and [Figure 3.21.](#) shows the sysIO Banks and their associated supplies for all devices.

**Figure 3.18. LA-MachXO2280 Banks**

**Figure 3.19. LA-MachXO1200 Banks**

Figure 3.20. LA-MachXO640 Banks

Figure 3.21. LA-MachXO256 Banks

### 3.6. Hot Socketing

The LA-MachXO automotive devices have been carefully designed to ensure predictable behavior during powerup and power-down. Leakage into I/O pins is controlled to within specified limits. This allows for easy integration with the rest of the system. These capabilities make the LA-MachXO ideal for many multiple power supply and hot-swap applications.

### 3.7. Sleep Mode

The LA-MachXO “C” devices ( $V_{CC} = 1.8/2.5/3.3V$ ) have a sleep mode that allows standby current to be reduced dramatically during periods of system inactivity. Entry and exit to Sleep mode is controlled by the SLEEPN pin.

During Sleep mode, the logic is non-operational, registers and EBR contents are not maintained, and I/Os are tristated. Do not enter Sleep mode during device programming or configuration operation. In Sleep mode, power supplies are in their normal operating range, eliminating the need for external switching of power supplies. Table 3.11. compares the characteristics of Normal, Off and Sleep modes.

**Table 3.11. Characteristics of Normal, Off and Sleep Modes**

Characteristic	Normal	Off	Sleep
SLEEPN Pin	High	—	Low
Static Icc	Typical <10 mA	0	Typical <100 uA
I/O Leakage	<10 $\mu A$	<1 mA	<10 $\mu A$
Power Supplies VCC/VCCIO/VCCAUX	Normal Range	0	Normal Range
Logic Operation	User Defined	Non Operational	Non operational
I/O Operation	User Defined	Tri-state	Tri-state
JTAG and Programming circuitry	Operational	Non-operational	Non-operational
EBR Contents and Registers	Maintained	Non-maintained	Non-maintained

#### 3.7.1. SLEEPN Pin Characteristics

The SLEEPN pin behaves as an LVCMOS input with the voltage standard appropriate to the VCC supply for the device. This pin also has a weak pull-up, along with a Schmidt trigger and glitch filter to prevent false triggering. An external pull-up to VCC is recommended when Sleep Mode is not used to ensure the device stays in normal operation mode. Typically, the device enters sleep mode several hundred nanoseconds after SLEEPN is held at a valid low and restarts normal operation as specified in the Sleep Mode Timing table. The AC and DC specifications portion of this data sheet shows a detailed timing diagram.

### 3.8. Oscillator

Every LA-MachXO device has an internal CMOS oscillator. The oscillator can be routed as an input clock to the clock tree or to general routing resources. The oscillator frequency can be divided by internal logic. There is a dedicated programming bit to enable/disable the oscillator. The oscillator frequency ranges from 16 MHz to 26 MHz.

### 3.9. Configuration and Testing

The following section describes the configuration and testing features of the LA-MachXO automotive family of devices.

#### 3.9.1. IEEE 1149.1-Compliant Boundary Scan Testability

All LA-MachXO devices have boundary scan cells that are accessed through an IEEE 1149.1 compliant test access port (TAP). This allows functional testing of the circuit board, on which the device is mounted, through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test data to be captured and shifted out for verification. The test access port consists of dedicated I/Os: TDI, TDO, TCK and TMS. The test access port shares its power supply with one of the VCCIO Banks (LA-MachXO256:  $V_{CCIO1}$ ; LA-MachXO640:  $V_{CCIO2}$ ; LA-MachXO1200 and LAMachXO2280:  $V_{CCIO5}$ ) and can operate with LVCMOS3.3, 2.5, 1.8, 1.5, and 1.2 standards.

For more details on boundary scan test, please see information regarding additional technical documentation at the end of this data sheet.

### 3.9.2. Device Configuration

All LA-MachXO devices contain a test access port that can be used for device configuration and programming.

The non-volatile memory in the LA-MachXO can be configured in two different modes:

- In IEEE 1532 mode via the IEEE 1149.1 port. In this mode, the device is off-line and I/Os are controlled by BSCAN registers.
- In background mode via the IEEE 1149.1 port. This allows the device to remain operational in user mode while reprogramming takes place.

The SRAM configuration memory can be configured in three different ways:

- At power-up via the on-chip non-volatile memory.
- After a refresh command is issued via the IEEE 1149.1 port.
- In IEEE 1532 mode via the IEEE 1149.1 port.

Figure 3.22. provides a pictorial representation of the different programming modes available in the LA-MachXO devices. On power-up, the SRAM is ready to be configured with IEEE 1149.1 serial TAP port using IEEE 1532 protocols.

#### Leave Alone I/O

When using IEEE 1532 mode for non-volatile memory programming, SRAM configuration, or issuing a refresh command, users may specify I/Os as high, low, tristated or held at current value. This provides excellent flexibility for implementing systems where reconfiguration or reprogramming occurs on-the-fly.

#### TransFR (Transparent Field Reconfiguration)

TransFR (TFR) is a unique Lattice technology that allows users to update their logic in the field without interrupting system operation using a single ispVM command. See Lattice technical note #TN1087, Minimizing System Interruption During Configuration Using TransFR Technology, for details.

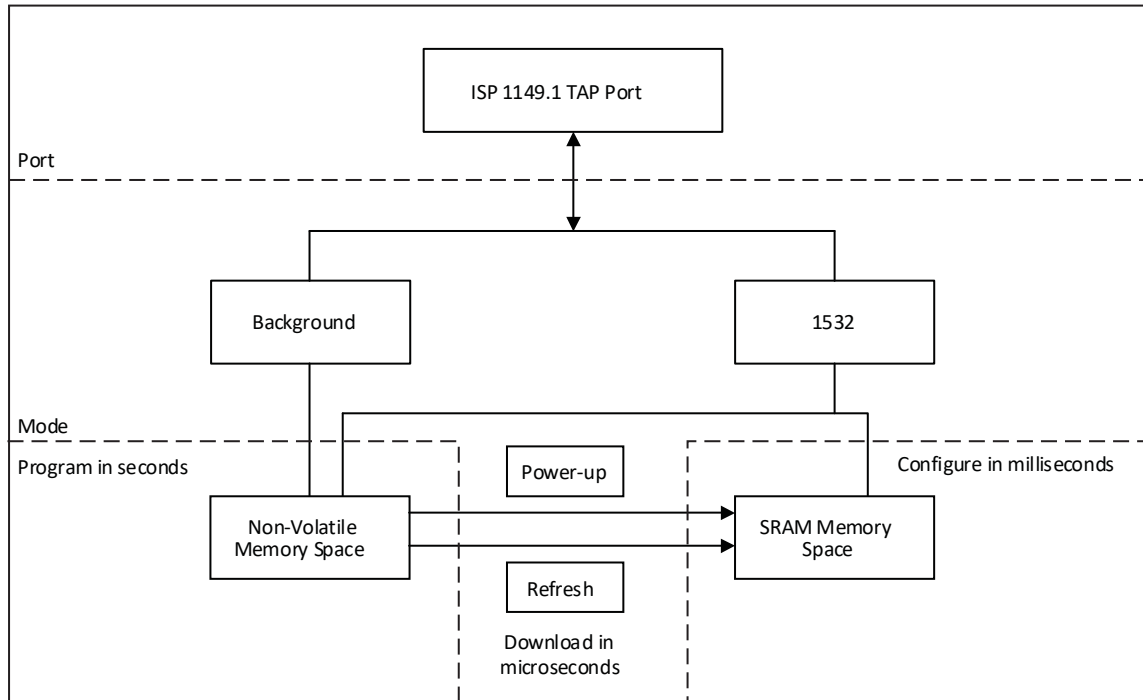

#### Security

The LA-MachXO automotive devices contain security bits that, when set, prevent the readback of the SRAM configuration and non-volatile memory spaces. Once set, the only way to clear the security bits is to erase the memory space.

For more information on device configuration, please see details of additional technical documentation at the end of this data sheet.

### 3.9.3. AEC-Q100 Tested and Qualified

The Automotive Electronics Council (AEC) consists of two committees: the Quality Systems Committee and the Component Technical Committee. These committees are composed of representatives from sustaining and other associate members. The AEC Component Technical Committee is the standardization body for establishing standards for reliable, high quality electronic components. In particular, the AEC-Q100 specification “Stress Test for Qualification for Integrated Circuits” defines qualification and re-qualification requirements for electronic components. Components meeting these specifications are suitable for use in the harsh automotive environment without additional component-level qualification testing. Lattice's LA-ispMACH 4000V and LA-MachXO devices completed and passed the requirements of the AEC-Q100 specification.

**Figure 3.22. LA-MachXO Configuration and Programming**

### 3.9.4. Density Shifting

The LA-MachXO family has been designed to enable density migration in the same package. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is also possible to shift a lower utilization design targeted for a high-density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

## 3.10. DC and Switching Characteristics

### 3.10.1. Absolute Maximum Ratings<sup>1, 2, 3</sup>

	LCMXO E (1.2V)	LCMXO C (1.8V/2.5V/3.3V)
Supply Voltage VCC.....	-0.5 to 1.32V.....	-0.5 to 3.75V
Supply Voltage VCCAUX.....	-0.5 to 3.75V.....	-0.5 to 3.75V
Output Supply Voltage VCCIO.....	-0.5 to 3.75V.....	-0.5 to 3.75V
I/O Tristate Voltage Applied 4.....	-0.5 to 3.75V.....	-0.5 to 3.75V
Dedicated Input Voltage Applied 4.....	-0.5 to 3.75V.....	-0.5 to 4.25V
Storage Temperature (ambient) .....	-65 to 150°C.....	-65 to 150°C
Junction Temp. (Tj) .....	+125°C.....	+125°C

**Notes:**

1. Stress above those listed under the “Absolute Maximum Ratings” may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. Compliance with the Lattice Thermal Management document is required.
3. All voltages referenced to GND.
4. Overshoot and undershoot of -2V to (VIHMAX + 2) volts is permitted for a duration of <20ns.

### 3.10.2. Recommended Operating Conditions<sup>1</sup>

Symbol	Parameter	Min.	Max.	Units
VCC	Core Supply Voltage for 1.2 V Devices	1.14	1.26	V
	Core Supply Voltage for 1.8 V/2.5 V/3.3 V Devices	1.71	3.465	V
VCCAUX3	Auxiliary Supply Voltage	3.135	3.465	V
VCCIO2	I/O Driver Supply Voltage	1.14	3.465	V
tJAUTO	Junction Temperature Automotive Operation	-40	125	oC
tJFLASHAUTO	Junction Temperature, Flash Programming, Automotive	-40	125	oC

**Notes:**

1. Like power supplies must be tied together. For example, if V<sub>CCIO</sub> and V<sub>CC</sub> are both 2.5 V, they must also be the same supply. 3.3 V V<sub>CCIO</sub> and 1.2 V V<sub>CCIO</sub> should be tied to V<sub>CCAUX</sub> or 1.2 V V<sub>CC</sub> respectively.
2. See recommended voltages by I/O standard in subsequent table.
3. V<sub>CC</sub> must reach minimum V<sub>CC</sub> value before V<sub>CCAUX</sub> reaches 2.5 V.

### 3.10.3. LA-MachXO256 and LA-MachXO640 Hot Socketing Specifications<sup>1, 2, 3</sup>

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
I <sub>DK</sub>	Input or I/O leakage Current	$0 \leq V_{IN} \leq V_{IH} \text{ (MAX)}$	—	—	+/-1000	μA

**Notes:**

1. Insensitive to sequence of V<sub>CC</sub>, V<sub>CCAUX</sub>, and V<sub>CCIO</sub>. However, assumes monotonic rise/fall rates for V<sub>CC</sub>, V<sub>CCAUX</sub>, and V<sub>CCIO</sub>.
2.  $0 \leq V_{CC} \leq V_{CC} \text{ (MAX)}$ ,  $0 \leq V_{CCIO} \leq V_{CCIO} \text{ (MAX)}$  and  $0 \leq V_{CCAUX} \leq V_{CCAUX} \text{ (MAX)}$ .
3. I<sub>DK</sub> is additive to I<sub>PU</sub>, I<sub>PD</sub> or I<sub>BH</sub>.

### 3.10.4. LA-MachXO1200 and LA-MachXO2280 Hot Socketing Specifications<sup>1, 2, 3, 4</sup>

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
<b>Non-LVDS General Purpose sysIOs</b>						
I <sub>DK</sub>	Input or I/O Leakage Current	$0 \leq V_{IN} \leq V_{IH} \text{ (MAX.)}$	—	—	+/-1000	μA
<b>LVDS General Purpose sysIOs</b>						
I <sub>DK_LVDS</sub>	Input or I/O Leakage Current	$V_{IN} \leq V_{CCIO}$	—	—	+/-1000	μA
		$V_{IN} > V_{CCIO}$	—	35	—	mA

**Notes:**

1. Insensitive to sequence of V<sub>CC</sub>, V<sub>CCAUX</sub>, and V<sub>CCIO</sub>. However, assumes monotonic rise/fall rates for V<sub>CC</sub>, V<sub>CCAUX</sub>, and V<sub>CCIO</sub>.
2.  $0 \leq V_{CC} \leq V_{CC} \text{ (MAX)}$ ,  $0 \leq V_{CCIO} \leq V_{CCIO} \text{ (MAX)}$ , and  $0 \leq V_{CCAUX} \leq V_{CCAUX} \text{ (MAX)}$ .
3. I<sub>DK</sub> is additive to I<sub>PU</sub>, I<sub>PW</sub> or I<sub>BH</sub>.
4. LVCMOS and LVTTTL only.

### 3.10.5. DC Electrical Characteristics

#### Over Recommended Operating Conditions

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
$I_{IL}, I_{IH}^{1, 4, 5}$	Input or I/O Leakage	$0 \leq V_{IN} \leq (V_{CCIO} - 0.2V)$	—	—	10	$\mu A$
		$(V_{CCIO} - 0.2V) < V_{IN} \leq 3.6V$	—	—	40	$\mu A$
$I_{PU}$	I/O Active Pull-up Current	$0 \leq V_{IN} \leq 0.7 V_{CCIO}$	-30	—	-150	$\mu A$
$I_{PD}$	I/O Active Pull-down Current	$V_{IL} (MAX) \leq V_{IN} \leq V_{IH} (MAX)$	30	—	150	$\mu A$
$I_{BHLS}$	Bus Hold Low sustaining current	$V_{IN} = V_{IL} (MAX)$	30	—	—	$\mu A$
$I_{BHHS}$	Bus Hold High sustaining current	$V_{IN} = 0.7V_{CCIO}$	-30	—	—	$\mu A$
$I_{BHLO}$	Bus Hold Low Overdrive current	$0 \leq V_{IN} \leq V_{IH} (MAX)$	—	—	150	$\mu A$
$I_{BHHO}$	Bus Hold High Overdrive current	$0 \leq V_{IN} \leq V_{IH} (MAX)$	—	—	-150	$\mu A$
$V_{BHT}^3$	Bus Hold trip Points	$0 \leq V_{IN} \leq V_{IH} (MAX)$	$V_{IL} (MAX)$	—	$V_{IH} (MIN)$	V
C1	I/O Capacitance <sup>2</sup>	$V_{CCIO} = 3.3V, 2.5V, 1.8V, 1.5V, 1.2V, V_{CC} = Typ., V_{IO} = 0 \text{ to } V_{IH} (MAX)$	—	8	—	pf
C2	Dedicated Input Capacitance <sup>2</sup>	$V_{CCIO} = 3.3V, 2.5V, 1.8V, 1.5V, 1.2V, V_{CC} = Typ., V_{IO} = 0 \text{ to } V_{IH} (MAX)$	—	8	—	pf

#### Notes:

- Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
- $T_A = 25^\circ C$ ,  $f = 1.0 \text{ MHz}$
- Please refer to  $V_{IL}$  and  $V_{IH}$  in the sysIO Single-Ended DC Electrical Characteristics table of this document.
- Not applicable to SLEEPN pin.
- When  $V_{IH}$  is higher than  $V_{CCIO}$ , a transient current typically of 30 ns in duration or less with a peak current of 6 mA can occur on the high-to-low transition. For LA-MachXO1200 and LA-MachXO2280 true LVDS output pins,  $V_{IH}$  must be less than or equal to  $V_{CCIO}$ .

### 3.10.6. Supply Current (Sleep Mode)<sup>1, 2</sup>

Symbol	Parameter	Device	Typ. <sup>3</sup>	Max.	Units
$I_{CC}$	Core Power Supply	LCMXO256C	12	25	$\mu A$
		LCMXO640C	12	25	$\mu A$
$I_{CCAUX}$	Auxiliary Power Supply	LCMXO256C	1	15	$\mu A$
		LCMXO640C	1	25	$\mu A$
$I_{CCIO}$	Bank Power Supply <sup>4</sup>	All LCMXO 'C' Devices	2	30	$\mu A$

#### Notes:

- Assumes all inputs are configured as LVCMOS and held at the VCCIO or GND.
- Frequency = 0 MHz.
- $T_A = 25^\circ C$ , power supplies at nominal voltage.
- Per Bank.

### 3.10.7. Supply Current (Standby)<sup>1, 2, 3, 4</sup>

#### Over Recommended Operating Conditions

Symbol	Parameter	Device	Typ. <sup>5</sup>	Units
I <sub>CC</sub>	Core Power Supply	LCMXO256C	7	mA
		LCMXO640C	9	mA
		LCMXO256E	4	mA
		LCMXO640E	6	mA
		LCMXO1200E	10	mA
		LCMXO2280E	12	mA
I <sub>CCAUX</sub>	Auxiliary Power Supply V <sub>CCAUX</sub> = 3.3V	LCMXO256E/C	5	mA
		LCMXO640E/C	7	mA
		LCMXO1200E	12	mA
		LCMXO2280E	13	mA
I <sub>CCIO</sub>	Bank Power Supply <sup>6</sup>	All devices	2	mA

#### Notes:

- For further information on supply current, please see details of additional technical documentation at the end of this data sheet.
- Assumes all outputs are tristated, all inputs are configured as LVCMOS and held at V<sub>CCIO</sub> or GND.
- Frequency = 0 MHz.
- User pattern = blank.
- T<sub>J</sub> = 25°C, power supplies at nominal voltage.
- Per Bank. V<sub>CCIO</sub> = 2.5 V. Does not include pull-up/pull-down

### 3.10.8. Initialization Supply Current<sup>1, 2, 3, 4</sup>

#### Over Recommended Operating Conditions

Symbol	Parameter	Device	Typ. <sup>5</sup>	Units
I <sub>CC</sub>	Core Power Supply	LCMXO256C	13	mA

		LCMXO256E	10	mA
		LCMXO640E	14	mA
		LCMXO1200E	18	mA
		LCMXO2280E	20	mA
I <sub>CCAUX</sub>	Auxiliary Power Supply V <sub>CCAUX</sub> = 3.3V	LCMXO256E/C	10	mA
		LCMXO640E/C	13	mA
		LCMXO1200E	24	mA
		LCMXO2280E	25	mA
I <sub>CCIO</sub>	Bank Power Supply <sup>6</sup>	All devices	2	mA

#### Notes:

- For further information on supply current, please see details of additional technical documentation at the end of this data sheet.
- Assumes all I/O pins are held at V<sub>CCIO</sub> or GND.
- Frequency = 0 MHz.
- Typical user pattern.
- T<sub>J</sub> = 25°C, power supplies at nominal voltage.
- Per Bank, V<sub>CCIO</sub> = 2.5 V. Does not include pull-up/pull-down

### 3.10.9. Programming and Erase Flash Supply Current<sup>1, 2, 3, 4</sup>

Symbol	Parameter	Device	Typ. <sup>5</sup>	Units
I <sub>CC</sub>	Core Power Supply	LCMXO256C	9	mA
		LCMXO640C	11	mA
		LCMXO256E	6	mA
		LCMXO640E	8	mA
		LCMXO1200E	12	mA
		LCMXO2280E	14	mA
I <sub>CCAUX</sub>	Auxiliary Power Supply V <sub>CCAUX</sub> = 3.3V	LCMXO256E/C	8	mA
		LCMXO640E/C	10	mA
		LCMXO1200E	15	mA
		LCMXO2280E	16	mA
I <sub>CCIO</sub>	Bank Power Supply <sup>6</sup>	All devices	2	mA

#### Notes:

- For further information on supply current, please see details of additional technical documentation at the end of this data sheet.
- Assumes all I/O pins are held at V<sub>CCIO</sub> or GND.
- Typical user pattern.
- JTAG programming is at 25 MHz.
- T<sub>j</sub> = 25°C, power supplies at nominal voltage.
- Per Bank. V<sub>CCIO</sub> = 2.5 V. Does not include pull-up/pull-down.

### 3.10.10. sysIO Recommended Operating Conditions

Standard	V <sub>CCIO</sub> (V)		
	Min.	Typ.	Max.
LVC MOS 3.3	3.135	3.3	3.465
LVC MOS 2.5	2.375	2.5	2.625
LVC MOS 1.8	1.71	1.8	1.89
LVC MOS 1.5	1.425	1.5	1.575
LVC MOS 1.2	1.14	1.2	1.26
LVTTL	3.135	3.3	3.465

I <sub>OSD</sub>	Output short circuit current	V <sub>OD</sub> = 0V Driver outputs shorted	—	—	6	mA

### 3.11.2. LVDS Emulation

LA-MachXO automotive devices can support LVDS outputs via emulation (LVDS25E), in addition to the LVDS support that is available on-chip on certain devices. The output is emulated using complementary LVCMOS outputs in conjunction with resistors across the driver outputs on all devices. The scheme shown in Figure 3.23. is one possible solution for LVDS standard implementation. Resistor values in Figure 3.23. are industry standard values for 1% resistors.

**Figure 3.23. LVDS Using External Resistors (LVDS25E)**

The LVDS differential input buffers are available on certain devices in the LA-MachXO family.

**Table 3.12. LVDS DC Conditions**

Over Recommended Operating Conditions			
Parameter	Description	Typical	Units
$Z_{OUT}$	Output impedance	20	$\Omega$
$R_S$	Driver series resistor	294	$\Omega$
$R_P$	Driver parallel resistor	121	$\Omega$
$R_T$	Receiver termination	100	$\Omega$
$V_{OH}$	Output high voltage	1.43	V
$V_{OL}$	Output low voltage	1.07	V
$V_{OD}$	Output differential voltage	0.35	V
$V_{CM}$	Output common mode voltage	1.25	V
$Z_{BACK}$	Back impedance	100	$\Omega$
$I_{DC}$	DC output current	3.66	mA

### 3.11.3. BLVDS

The LA-MachXO automotive family supports the BLVDS standard through emulation. The output is emulated using complementary LVCMOS outputs in conjunction with a parallel external resistor across the driver outputs. The input standard is supported by the LVDS differential input buffer on certain devices. BLVDS is intended for use when multi-drop and bi-directional multi-point differential signaling is required. The scheme shown in Figure 3.24. is one possible solution for bi-directional multi-point differential signals.

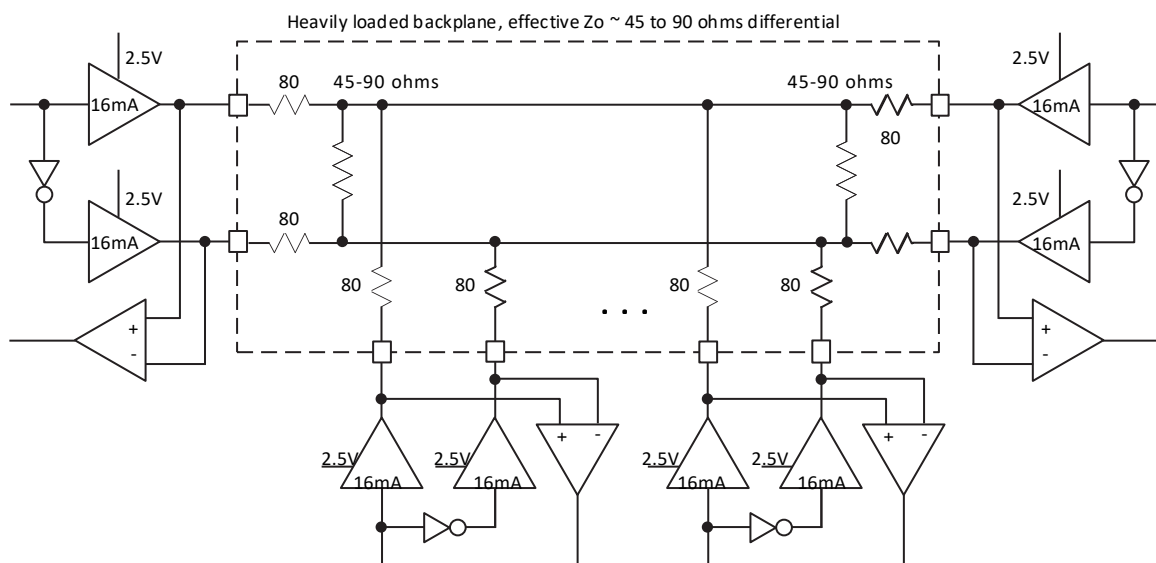

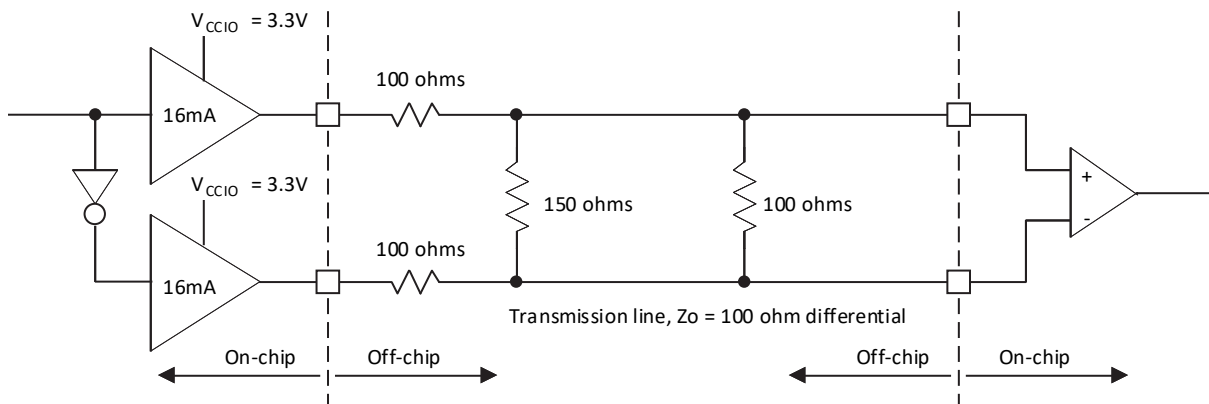

Figure 3.24. BLVDS Multi-point Output Example

Table 3.13. BLVDS DC Conditions<sup>1</sup>

Over Recommended Operating Conditions				
Symbol	Description	Nominal		Units
		Zo = 45	Zo = 90	
ZOUT	Output impedance	100	100	ohm
RTLEFT	Left end termination	45	90	ohm
RTRIGHT	Right end termination	45	90	ohm
VOH	Output high voltage	1.375	1.48	V
VOL	Output low voltage	1.125	1.02	V
VOD	Output differential voltage	0.25	0.46	V
VCM	Output common mode voltage	1.25	1.25	V
IDC	DC output current	11.2	10.2	mA

### 3.11.4. LVPECL

The LA-MachXO automotive family supports the differential LVPECL standard through emulation. This output standard is emulated using complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs on all the devices. The LVPECL input standard is supported by the LVDS differential input buffer on certain devices. The scheme shown in Figure 3.25, is one possible solution for point-to-point signals.

**Figure 3.25. Differential LVPECL**

**Table 3.14. LVPECL DC Conditions<sup>1</sup>**

Over Recommended Operating Conditions			
Symbol	Description	Nominal	Units
Z <sub>OUT</sub>	Output impedance	100	ohm
R <sub>p</sub>	Driver parallel resistor	150	ohm
R <sub>T</sub>	Receiver termination	100	ohm
V <sub>OH</sub>	Output high voltage	2.03	V
V <sub>OL</sub>	Output low voltage	1.27	V
V <sub>OD</sub>	Output differential voltage	0.76	V
V <sub>CM</sub>	Output common mode voltage	1.65	V
Z <sub>BACK</sub>	Back impedance	85.7	ohm
I <sub>DC</sub>	DC output current	12.7	mA

**Note:** For input buffer, see LVDS table.

For further information on LVPECL, BLVDS and other differential interfaces please see details of additional technical documentation at the end of the data sheet.

### 3.11.5. RSDS

The LA-MachXO automotive family supports the differential RSDS standard. The output standard is emulated using complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs on all the devices. The RSDS input standard is supported by the LVDS differential input buffer on certain devices. The scheme shown in [Figure 3.26](#) is one possible solution for RSDS standard implementation. Use LVDS25E mode with suggested resistors for RSDS operation. Resistor values in [Figure 3.26](#) are industry standard values for 1% resistors.

Figure 3.26. RSDS (Reduced Swing Differential Standard)

Table 3.15. RSDS DC Conditions

Parameter	Description	Typical	Units
Z <sub>OUT</sub>	Output impedance	20	ohm
R <sub>S</sub>	Driver series resistor	294	ohm
R <sub>P</sub>	Driver parallel resistor	121	ohm
R <sub>T</sub>	Receiver termination	100	ohm
V <sub>OH</sub>	Output high voltage	1.35	V
V <sub>OL</sub>	Output low voltage	1.15	V
V <sub>OD</sub>	Output differential voltage	0.20	V
V <sub>CM</sub>	Output common mode voltage	1.25	V
Z <sub>BACK</sub>	Back impedance	101.5	ohm
I <sub>DC</sub>	DC output current	3.66	mA

### 3.12. Typical Building Block Function Performance<sup>1</sup>

#### Pin-to-Pin Performance (LVCMOS25 12mA Drive)

Function	-3 Timing	Units
Basic Functions		
16-bit decoder	9.4	ns
4:1 MUX	6.3	ns
16:1 MUX	7.1	ns

### 3.12.1. Register-to-Register Performance

Function	-3 Timing	Units
<b>Basic Functions</b>		
16:1 MUX	348	MHz
16-bit adder	209	MHz
16-bit counter	277	MHz
64-bit counter	143	MHz
<b>Embedded Memory Functions (1200 and 2280 Devices Only)</b>		
256x36 Single Port RAM	203	MHz
512x18 True-Dual Port RAM	203	MHz
<b>Distributed Memory Functions</b>		
16x2 Single Port RAM	310	MHz
64x2 Single Port RAM	229	MHz
128x4 Single Port RAM	186	MHz
32x2 Pseudo-Dual Port RAM	224	MHz
64x4 Pseudo-Dual Port RAM	194	MHz

**Note:** The above timing numbers are generated using the ispLEVER design tool. Exact performance may vary with device and tool version. The tool uses internal parameters that have been characterized but are not tested on every device. Rev. A 0.19

### 3.13. Derating Logic Timing

Logic Timing provided in the following sections of the data sheet and the ispLEVER design tools are worst case numbers in the operating range. Actual delays may be much faster. The ispLEVER design tool from Lattice can provide logic timing numbers at a particular temperature and voltage.

PCI33 <sup>4</sup>	PCI33	2.59	ns

**Notes:**

1. Timing adders are characterized but not tested on every device.
2. LVC MOS timing is measured with the load specified in Switching Test Conditions table.
3. All other standards tested according to the appropriate specifications.
4. I/O standard only available in LCMXO1200 and LCMXO2280 devices.

Rev. A 0.19

### 3.17. sysCLOCK PLL Timing

Over Recommended Operating Conditions

Parameter	Descriptions	Conditions	Min.	Max.	Units
$f_{IN}$	Input Clock Frequency (CLKI, CLKFB)		25	420	MHz
$f_{OUT}$	Output Clock Frequency (CLKOP, CLKOS)		25	420	MHz
$f_{OUT2}$	K-Divider Output Frequency (CLKOK)		0.195	210	MHz
$f_{VCO}$	PLL VCO Frequency		420	840	MHz
$f_{PFD}$	Phase Detector Input Frequency		25	—	MHz
<b>AC Characteristics</b>					
$t_{DT}$	Output Clock Duty Cycle	Default duty cycle selected <sup>3</sup>	45	55	%
$t_{PH}^4$	Output Phase Accuracy		—	0.05	UI
$t_{OPJIT}^1$	Output Clock Period Jitter	$F_{out} \geq 100\text{MHz}$	—	+/-120	ps
		$F_{out} < 100\text{MHz}$	—	0.02	UIPP
$t_{SK}$	Input Clock to Output Clock Skew	Divider ratio = integer	—	+/-200	ps
$t_W$	Output Clock Pulse Width	At 90% or 10% <sup>3</sup>	1	—	ns
$t_{LOCK}^2$	PLL Lock-in Time		—	150	$\mu\text{s}$
$t_{PA}$	Programmable Delay Unit		100	450	ps
$t_{IPJIT}$	Input Clock Period Jitter		—	+/-200	ps
$t_{FBKDLY}$	External Feedback Delay		—	10	ns
$t_{HI}$	Input Clock High Time	90% to 90%	0.5	—	ns
$t_{LO}$	Input Clock Low Time	10% to 10%	0.5	—	ns
$t_{RST}$	RST Pulse Width		10	—	ns

**Notes:**

1. Jitter sample is taken over 10,000 samples of the primary PLL output with a clean reference clock.
2. Output clock is valid after  $t_{LOCK}$  for PLL reset and dynamic delay adjustment.
3. Using LVDS output buffers.
4. CLKOS as compared to CLKOP output.

Rev. A 0.19

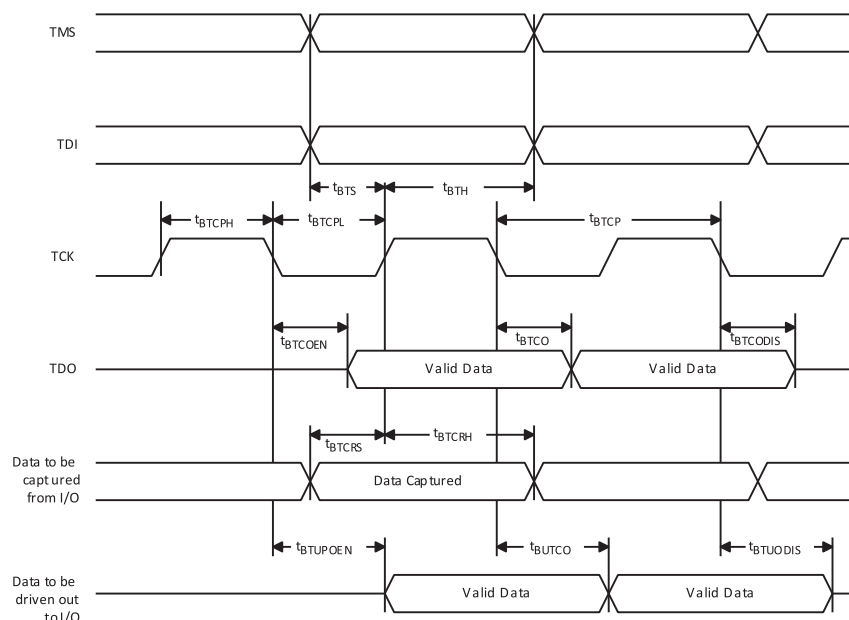

Figure 3.28. JTAG Port Timing Waveforms

### 3.21. Switching Test Conditions

Figure 3.29. shows the output test load that is used for AC testing. The specific values for resistance, capacitance, voltage, and other test conditions are shown in Table 3.16.

Figure 3.29. Output Test Load, LVTTTL and LVCMOS Standards

Table 3.16. Test Fixture Required Components, Non-Terminated Interfaces

Test Condition	$R_1$	$C_L$	Timing Ref.	$V_T$
LVTTTL and LVCMOS settings (L → H, H → L)	$\infty$	0pF	LVTTTL, LVCMOS 3.3 = 1.5V	—
			LVCMOS 2.5 = $V_{CCIO}/2$	—
			LVCMOS 1.8 = $V_{CCIO}/2$	—
			LVCMOS 1.5 = $V_{CCIO}/2$	—
			LVCMOS 1.2 = $V_{CCIO}/2$	—
LVTTTL and LVCMOS 3.3 (Z → H)	188	0pF	1.5	$V_{OL}$
LVTTTL and LVCMOS 3.3 (Z → L)				$V_{OH}$
Other LVCMOS (Z → H)			$V_{CCIO}/2$	$V_{OL}$
Other LVCMOS (Z → L)			$V_{CCIO}/2$	$V_{OH}$
LVTTTL + LVCMOS (H → Z)			$V_{OH} - 0.15$	$V_{OL}$
LVTTTL + LVCMOS (L → Z)			$V_{OL} - 0.15$	$V_{OH}$

**Note:** Output test conditions for all other interfaces are determined by the respective standards.

## 4. Pinout Information

### 4.1. Signal Descriptions

Table 4.1. Signal Descriptions

Signal Name	I/O	Descriptions
<b>General Purpose</b>		
P[Edge] [Row/Column Number]_[A/B/C/D/E/F]	I/O	<p>[Edge] indicates the edge of the device on which the pad is located. Valid edge designations are L (Left), B (Bottom), R (Right), T (Top).</p> <p>[Row/Column Number] indicates the PFU row or the column of the device on which the PIO Group exists. When Edge is T (Top) or (Bottom), only need to specify Row Number. When Edge is L (Left) or R (Right), only need to specify Column Number.</p> <p>[A/B/C/D/E/F] indicates the PIO within the group to which the pad is connected.</p> <p>Some of these user programmable pins are shared with special function pins. When not used as special function pins, these pins can be programmed as I/Os for user logic.</p> <p>During configuration of the user-programmable I/Os, the user has an option to tri-state the I/Os and enable an internal pull-up resistor. This option also applies to unused pins (or those not bonded to a package pin). The default during configuration is for user-programmable I/Os to be tri-stated with an internal pull-up resistor enabled.</p>
GSRN	I	Global RESET signal (active low). Dedicated pad, when not in use it can be used as an I/O pin.
TSALL	I	TSALL is a dedicated pad for the global output enable signal. When TSALL is high all the outputs are tristated. It is a dual function pin. When not in use, it can be used as an I/O pin.
NC	—	No connect.
GND	—	GND - Ground. Dedicated pins.
V <sub>CC</sub>	—	VCC - The power supply pins for core logic. Dedicated pins.
V <sub>CCAUX</sub>	—	VCCAUX - the Auxiliary power supply pin. This pin powers up a variety of internal circuits including all the differential and referenced input buffers. Dedicated pins.
V <sub>CCIOx</sub>	—	VCCIO - The power supply pins for I/O Bank x. Dedicated pins.
SLEEPN <sup>1</sup>	I	Sleep Mode pin - Active low sleep pin. When this pin is held high, the device operates normally. This pin has a weak internal pull-up, but when unused, an external pull-up to V <sub>CC</sub> is recommended. When driven low, the device moves into Sleep mode after a specified time.
<b>PLL and Clock Functions (Used as user programmable I/O pins when not used for PLL or clock pins)</b>		
[LOC][0]_PLL[T, C]_IN	—	Reference clock (PLL) input Pads: [LOC] indicates location. Valid designations are ULM (Upper PLL) and LLM (Lower PLL). T = true and C = complement.
[LOC][0]_PLL[T, C]_FB	—	Optional feedback (PLL) input Pads: [LOC] indicates location. Valid designations are ULM (Upper PLL) and LLM (Lower PLL). T = true and C = complement.
PCLK [n]_[1:0]	—	Primary Clock Pads, n per side.
<b>Test and Programming (Dedicated pins)</b>		
TMS	I	Test Mode Select input pin, used to control the 1149.1 state machine.
TCK	I	Test Clock input pin, used to clock the 1149.1 state machine.
TDI	I	Test Data input pin, used to load data into the device using an 1149.1 state machine.
TDO	O	Output pin -Test Data output pin used to shift data out of the device using 1149.1.

**Note:** Applies to LA-MachXO “C” devices only. NC for “E” devices.

## 4.2. Pin Information Summary

VCCAUX	LAMXO256/640: 88 LAMXO1200/2280: 36, 90	53, 128
GND <sup>2</sup>	LAMXO256: 40, 84, 62, 75, 93, 12, 25, 42 LAMXO640: 40, 84, 81, 93, 62, 75, 30, 42, 12, 25 LAMXO1200/2280: 9, 41, 59, 83, 100, 76, 50, 26	16, 59, 88, 123, 118, 136, 83, 99, 37, 64, 11, 27
NC <sup>3</sup>		

**Notes:**

1. Pin orientation follows the conventional order from pin 1 marking of the top side view and counter-clockwise.
2. All grounds must be electrically connected at the board level. For fpBGA and ftBGA packages, the total number of GND balls is less than the actual number of GND logic connections from the die to the common package GND plane.
3. NC pins should not be connected to any active signals, VCC or GND.

#### 4.4. Power Supply and NC (Cont.)

Signal	256 ftBGA <sup>1</sup>	324 ftBGA <sup>1</sup>

**Notes:**

1. Supports true LVDS outputs.
2. Primary clock inputs are single-ended.

## 4.10. Thermal Management

Thermal management is recommended as part of any sound FPGA design methodology. To assess the thermal characteristics of a system, Lattice specifies a maximum allowable junction temperature in all device data sheets. Designers must complete a thermal analysis of their specific design to ensure that the device and package do not exceed the junction temperature limits. Refer to the Thermal Management document to find the device/package specific thermal values.

### 4.10.1. For Further Information

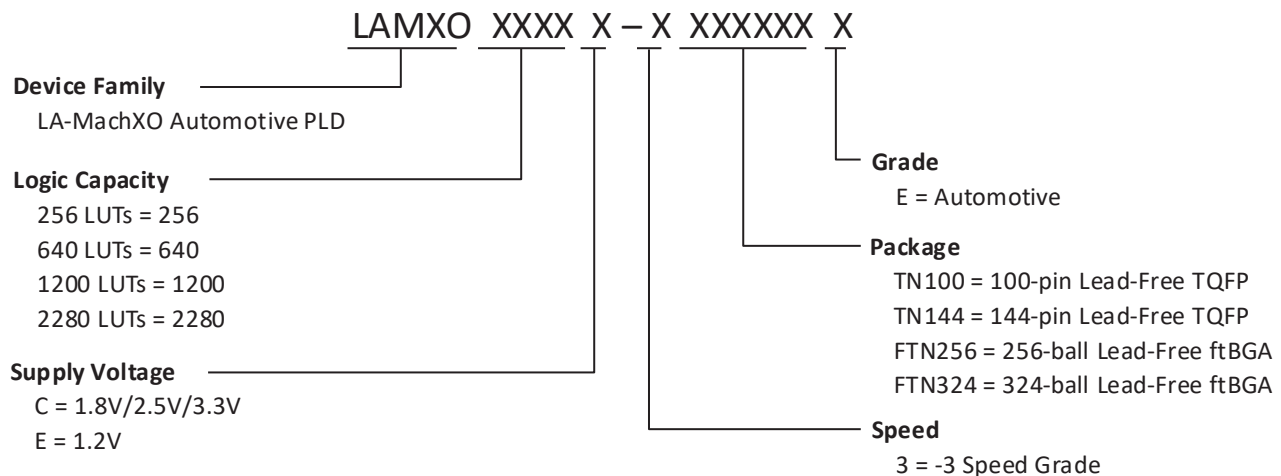

For further information regarding Thermal Management, refer to the following located on the Lattice website at [www.latticesemi.com](http://www.latticesemi.com).

- Thermal Management document
- Technical Note TN1090 - Power Estimation and Management for MachXO Devices
- Power Calculator tool included with Lattice's ispLEVER design tool, or as a standalone download from [www.latticesemi.com/software](http://www.latticesemi.com/software)

## 5. Ordering Information

### 5.1. Part Number Description

**Figure 5.1.**

## 5.2. Ordering Information

Part Number	LUTs	Supply Voltage	I/Os	Grade	Package	Pins	Temp.

## 6. Supplemental Information

### 6.1. For Further Information

A variety of technical notes for the LA-MachXO family are available on the Lattice web site at [www.latticesemi.com](http://www.latticesemi.com).

- MachXO sysIO Usage Guide (FPGA-TN-02169)
- MachXO sysCLOCK PLL Design and Usage Guide (FPGA-TN-02168)
- MachXO Memory Usage Guide (FPGA-TN-02170)
- Power Estimation and Management for MachXO Devices (FPGA-TN-02171)
- MachXO JTAG Programming and Configuration User's Guide (FPGA-TN-02167)
- Minimizing System Interruption During Configuration Using TransFR Technology (FPGA-TN-02025-37)
- MachXO Density Migration (FPGA-TN-02165)
- IEEE 1149.1 Boundary Scan Testability in Lattice Devices

For further information on interface standards refer to the following web sites:

- JEDEC Standards (LVTTTL, LVCMOS): [www.jedec.org](http://www.jedec.org)
- PCI: [www.pcisig.com](http://www.pcisig.com)

## Technical Support Assistance

Submit a technical support case through [www.latticesemi.com/techsupport](http://www.latticesemi.com/techsupport).

## Revision History

### Revision 1.6, December 2019

Section	Change Summary
All	<ul style="list-style-type: none"> <li>Changed document number from DS1003 to FPGA-DS-02070.</li> <li>Updated document template.</li> </ul>
Disclaimers	Added this section.

### Revision 1.5, November 2007

Section	Change Summary
DC and Switching Characteristics	<ul style="list-style-type: none"> <li>Updated sysIO Single-Ended DC Electrical Characteristics table.</li> <li>Added JTAG Port Timing Waveforms diagram.</li> </ul>
Pinout Information	Added Thermal Management text section.
Supplemental Information	Updated title list.

### Revision 1.4, February 2007

Section	Change Summary
Architecture	Updated EBR Asynchronous Reset section.

### Revision 1.3, December 2006

Section	Change Summary
Architecture	EBR Asynchronous Reset section added.
