

**100mA REGULATED CHARGE PUMP****AP3602A/B****Pin Configuration**

Figure 2. Pin Configuration of AP3602A/B (Top View)

**Pin Description**

Pin Number	Pin Name	Function
1	V <sub>OUT</sub>	Regulated Output Voltage. V <sub>OUT</sub> should be bypassed with a 1 $\mu$ F to 22 $\mu$ F low ESR ceramic capacitor which is placed as close to the pin as possible for best performance
2	GND	Ground. GND should be tied to a ground plane for best performance. The C <sub>OUT</sub> and C <sub>IN</sub> should be placed as close to this pin as possible
3	SHDN	Active Low Shutdown Input. A low signal on SHDN disables the AP3602A/B, while a high signal enables the AP3602A/B. SHDN pin must not be allowed to float
4	C-	Flying Capacitor Negative Terminal. The flying capacitor should be placed as close to this pin as possible
5	V <sub>IN</sub>	Input Supply Voltage. V <sub>IN</sub> should be bypassed with a 1 $\mu$ F to 22 $\mu$ F low ESR ceramic capacitor which is placed as close to the pin as possible for best performance
6	C+	Flying Capacitor Positive Terminal. The flying capacitor should be placed as close to this pin as possible

## Absolute Maximum Ratings (Note 1)

Parameter	Symbol	Value	Unit
Input Voltage	V <sub>IN</sub>	7	V
Output Voltage	V <sub>O</sub>	7	V
SHDN Pin Voltage	V <sub>SHDN</sub>	7	V
Thermal Resistance (Junction to Ambient, no Heat sink)	R <sub>θJA</sub>	300	°C/W
Operating Junction Temperature	T <sub>J</sub>	150	°C
Storage Temperature Range	T <sub>STG</sub>	-65 to 150	°C
Lead Temperature (Soldering, 10sec)	T <sub>LEAD</sub>	260	°C
ESD (Human Body Model)		2000	V

Note 1: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "Recommended Operating Conditions" is not implied. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability.

## Recommended Operating Conditions

Parameter	Symbol		Min	Max	Unit
Input Voltage	V <sub>IN</sub>	AP3602A	2.7	5	V
		AP3602B	2.7	4.5	
Operating Temperature	T <sub>A</sub>		-40	85	°C

**100mA REGULATED CHARGE PUMP****AP3602A/B****Application Information****Operating Principles**

The AP3602A/B use a switched capacitor charge pump to boost the input voltage to a regulated output voltage. Regulation is achieved by sensing the chip output voltage through an internal resistor divider network. Controlled by an internal comparator (refer to the functional block diagram), the charge pump circuit is enabled when the divided output voltage is below a preset trip point.

The charge pump operates at 1.2MHz with 50% duty cycle. Conversion consists of a two-phase operation. In the first phase, switches S2 and S3 are opened and S1 and S4 are closed. During this time,  $C_{FLY}$  charges to the voltage on  $V_{IN}$  and load current is supplied by  $C_{OUT}$ . During the second phase, S2 and S3 are closed, and S1 and S4 are opened. This action connects  $C_{FLY}$  low side to  $V_{IN}$ ,  $C_{FLY}$  high side to  $V_{OUT}$ , then a voltage about  $2*V_{IN}$  is used to charge  $C_{OUT}$  and supply the load current. For each cycle, charges is transported from  $V_{IN}$  to  $V_{OUT}$  to maintain the output voltage in its nominal value.

This process breaks when the  $V_{OUT}$  is high enough for the reason of higher input voltage or lower load, then the divided voltage at the control comparator exceeds the internal trip point high level, which compels the charge pump circuit enter to the idle mode in which the switching cycle stops (pulse skipping) and the output voltage is continually decreased because it is maintained by the discharging of  $C_{OUT}$  only. In idle mode, the feedback circuit continues sensing  $V_{OUT}$ . If the

divided voltage at the control comparator drops below the preset trip point, the comparator will start the switching cycle again.

In idle mode, the AP3602A/B's quiescent current is about  $13\mu A$ . In shutdown mode, all internal circuitry is turned off and the AP3602A/B draw only leakage current from  $V_{IN}$ , which is less than  $1\mu A$ . So, the shutdown power loss for AP3602A/B is very low, that is beneficial to the battery supplied systems.

**Short Circuit and Thermal Protection**

The AP3602A/B have a thermal protection and shutdown circuit that continuously monitors the IC junction temperature.

When output short circuit occurs, the short circuit current is about 300mA (Typical). Under this condition, the  $I_{IN}$  is about  $2*I_{out}$ , which causes about 1.8W instant power dissipation on AP3602A/B, that will cause a rise in the internal IC junction temperature. If the thermal protection circuit senses the junction temperature exceeding approximately  $160^{\circ}C$ , the thermal shutdown circuit will disable the charge pump switching circuit. The thermal hysteresis is about  $10^{\circ}C$ , which means that the charge pump circuit can be active when the short circuit is removed and the junction temperature drops below  $150^{\circ}C$ .

The thermal shutdown protection will cycle on and off if an output short circuit condition persists. This will allow the AP3602A/B to operate on a short circuit condition without latch up or damage to the device.
