

# LC75700T

## Specifications

**Absolute Maximum Ratings** at  $T_a = 25^{\circ}\text{C}$ ,  $V_{SS} = 0\text{ V}$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	$V_{DD\text{ max}}$	$V_{DD}$	-0.3 to +7.0	V
Input voltage	$V_{IN1}$	CE, CL, DI, $\overline{\text{RES}}$	-0.3 to +7.0	V
	$V_{IN2}$	OSC, KI1 to KI5	-0.3 to $V_{DD} + 0.3$	
Output voltage	$V_{OUT1}$	DO	-0.3 to +7.0	V
	$V_{OUT2}$	OSC, KS1 to KS6, P1 to P4	-0.3 to $V_{DD} + 0.3$	
Output current	$I_{OUT1}$	KS1 to KS6	1	mA
	$I_{OUT2}$	P1 to P4	5	
Allowable power dissipation	$P_d\text{ max}$	$T_a = 85^{\circ}\text{C}$	150	mW
Operating temperature	$T_{opr}$		-40 to +85	$^{\circ}\text{C}$
Storage temperature	$T_{stg}$		-50 to +150	$^{\circ}\text{C}$

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

**Allowable Operating Ranges** at  $T_a = -40$  to  $+85^{\circ}\text{C}$ ,  $V_{SS} = 0\text{ V}$

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Supply voltage	$V_{DD}$	$V_{DD}$	2.7	5.0	5.5	V
Input high level voltage	$V_{IH1}$	CE, CL, DI, $\overline{\text{RES}}$	$0.8 V_{DD}$		5.5	V
	$V_{IH2}$	KI1 to KI5	$0.6 V_{DD}$		$V_{DD}$	
Input low level voltage	$V_{IL}$	CE, CL, DI, $\overline{\text{RES}}$ , KI1 to KI5	0		$0.2 V_{DD}$	V
Recommended external resistance	$R_{osc}$	OSC		39		k $\Omega$
Recommended external capacitance	$C_{osc}$	OSC		1000		pF
Guaranteed oscillator range	$f_{osc}$	OSC	19	38	76	kHz
Low level clock pulse width	$t_{\text{L}}$	CL See figure 1.	160			ns
High level clock pulse width	$t_{\text{H}}$	CL See figure 1.	160			ns
Data setup time	$t_{ds}$	DI, CL See figure 1.	160			ns
Data hold time	$t_{dh}$	DI, CL See figure 1.	160			ns
CE wait time	$t_{cp}$	CE, CL See figure 1.	160			ns
CE setup time	$t_{cs}$	CE, CL See figure 1.	160			ns
CE hold time	$t_{ch}$	CE, CL See figure 1.	160			ns
DO output delay time	$t_{dc}$	DO $R_{PU} = 4.7\text{ k}\Omega$ , $C_L = 10\text{ pF}$ *1 See figure 1.			1.5	$\mu\text{s}$
DO rise time	$t_{dr}$	DO $R_{PU} = 4.7\text{ k}\Omega$ , $C_L = 10\text{ pF}$ *1 See figure 1.			1.5	$\mu\text{s}$

Note: \*1. Since DO is an open-drain output, these times depend on the values of the pull-up resistor  $R_{PU}$  and the load capacitance  $C_L$ .

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

# LC75700T

## Electrical Characteristics in the Allowable Operating Ranges

Parameter	Symbol	Pin Name	Conditions	Ratings			Unit
				min	typ	max	
Hysteresis	V <sub>H</sub>	CE, CL, DI, $\overline{\text{RES}}$ , K11 to K15			0.1 V <sub>DD</sub>		V
Input high level current	I <sub>IH</sub>	CE, CL, DI, $\overline{\text{RES}}$	V <sub>I</sub> = 5.5 V			5	μA
Input low level current	I <sub>IL</sub>	CE, CL, DI, $\overline{\text{RES}}$	V <sub>I</sub> = 0 V	-5			μA

## Pin Functions

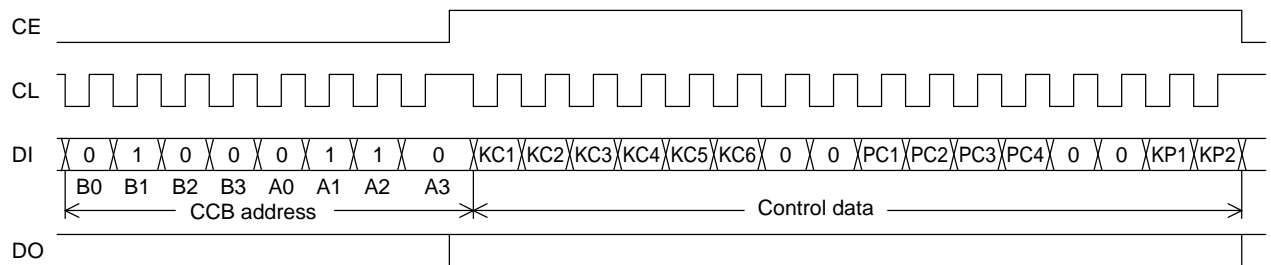

Pin	Pin No.	Function	Active	I/O	Handling when unused
KI1 to KI5	1 to 5	Key scan inputs. These pins have built-in pull-down resistors.	H	I	GND
KS1 to KS3	6 to 8	Key scan outputs. Although normal key scan timing lines require diodes to be inserted in the timing lines to prevent shorts, since these outputs are unbalanced CMOS transistor outputs, these outputs will not be damaged by shorting when these outputs are used to from a key matrix.	—	O	Open
KS4/P4 to KS6/P2	9 to 11	Key scan outputs and general-purpose output ports shared-function pins. These pins can be set the key scan output ports or the general-purpose output ports by the control data "KP1 and KP2".	—	O	Open
P1	12	The P1 is general-purpose output ports.	—	O	Open
OSC	14	Oscillator connection. An oscillator circuit is formed by connecting an external resistor and capacitor at this pin.	—	I/O	V <sub>DD</sub>
$\overline{\text{RES}}$	16	Reset input. that re-initializes the LSI internal states. This pin must be used. <ul style="list-style-type: none"> <li>When <math>\overline{\text{RES}}</math> is low (V<sub>SS</sub>) <ul style="list-style-type: none"> <li>Key scanning disabled: KS1 to KS3 = low (V<sub>SS</sub>).</li> <li>Key scan outputs and general output ports shared-function pins: KS4/P4 to KS6/P2 = low (V<sub>SS</sub>).</li> <li>General-purpose output port: P1 = low (V<sub>SS</sub>).</li> <li>All the key data is reset to low.</li> </ul> </li> <li>When <math>\overline{\text{RES}}</math> is high (V<sub>DD</sub>) <ul style="list-style-type: none"> <li>The states of the pins as key scan output pins or general-purpose output ports, must be set with the control data.</li> <li>And key scanning is a enabled.</li> </ul> </li> </ul> Note that serial data must be transferred when $\overline{\text{RES}}$ is high.	L	I	GND
CE	18	Serial data interface. Connections to the controller. Note that DO, being an open-drain output, requires a pull-up resistor. CE: Chip enable CL: Synchronization clock DI: Transfer data DO: Output data	H	I	GND
CL	19			I	
DI	20		—	I	
DO	17		—	O	Open
V <sub>DD</sub>	15	Power supply. A voltage of between 2.7 V and 5.5 V must be supplied.	—	—	—
V <sub>SS</sub>	13	Ground. Must be connected to the system ground.	—	—	—

## Serial Data Input

### 1. When CL is stopped at the low level

### 2. When CL is stopped at the high level

- CCB address: 62H
- KC1 to KC6: Key scan output state setting data
- PC1 to PC4: General-purpose output port state setting data
- KP1, KP2: Selection data between the key scan output ports and the general-purpose output ports.

## Control Data Functions

### 1. KP1, KP2: Selection data between the key scan output ports and the general-purpose output ports.

These control data bits switch the functions of the KS4/P4 to KS6/P2 output pins between the key scan output port and the general-purpose output port.

KP1	KP2	Output pins			Maximum number of key inputs	Number of general-purpose output ports (+ P1)
		KS4/P4	KS5/P3	KS6/P2		
0	0	KS4	KS5	KS6	30	0 (+1)
1	0	KS4	KS5	P2	25	1 (+1)
0	1	KS4	P3	P2	20	2 (+1)
1	1	P4	P3	P2	15	3 (+1)

Note: KSn (n = 4 to 6): Key scan output ports  
Pn (n = 4 to 2): General-purpose output ports

### 2. KC1 to KC6: Key scan output state setting data

These control data bits set the states of the key scan output pins KS1 to KS6.

Output pins	KS1	KS2	KS3	KS4	KS5	KS6
Key scan output state setting data	KC1	KC2	KC3	KC4	KC5	KC6

For example, if the KS4/P4 to KS6/P2 output pins are set to function as key scan output ports, when KC1 to KC3 are set to 1 and KC4 to KC6 are set to 0, in the key scan standby state, the KS1 to KS3 output pins will output the high level ( $V_{DD}$ ) and the KS4 to KS6 pins will output the low level ( $V_{SS}$ ). Note that key scan output signals are not output from output pins that are set to the low level.

### 3. PC1 to PC4: General-purpose output port state setting data

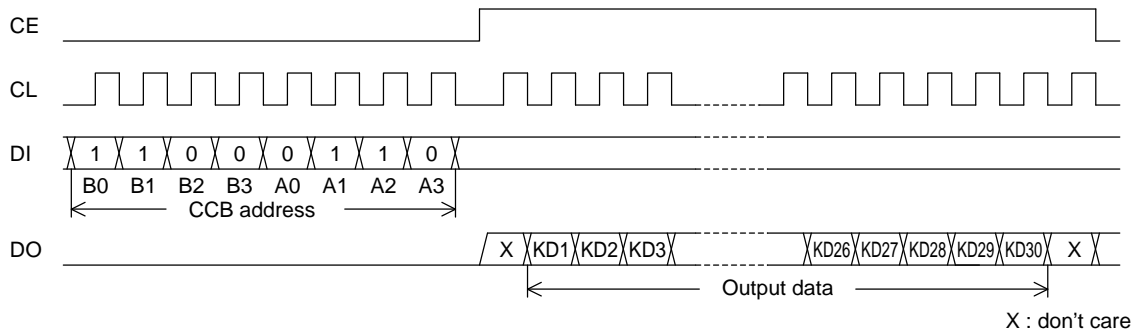

These control data bits set the states of the general-purpose output ports P1 to P4.

Output pins	P1	P2	P3	P4
General-purpose output port state setting data	PC1	PC2	PC3	PC4

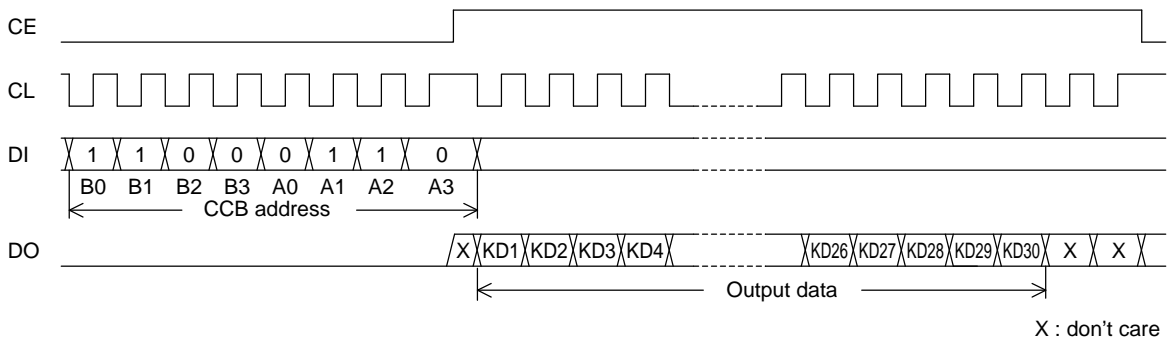

For example, if the KS4/P4 to KS6/P2 output pins are set to function as general-purpose output ports, when PC1 and PC2 are set to 1, and PC3 and PC4 are set to 0, the P1 and P2 output pins will output the high level ( $V_{DD}$ ), and P3 and P4 will output the low level ( $V_{SS}$ ).

## Serial Data Output

### 1. When CL is stopped at the low level

### 2. When CL is stopped at the high level

- CCB address: 63H
- KD1 to KD30: Key data

Note: If a key data read operation is executed when DO is high, the read key data (KD1 to KD30) will be invalid.

## Output Data

### 1. KD1 to KD30: Key data

When a key matrix of up to 30 keys is formed from the KS1 to KS6 key scan output pins and the KI1 to KI5 key scan input pins and one of those key is pressed, the key output data corresponding to that key will be set to 1. The table shows the relationship between those pins and the key data bits.

	KI1	KI2	KI3	KI4	KI5
KS1	KD1	KD2	KD3	KD4	KD5
KS2	KD6	KD7	KD8	KD9	KD10
KS3	KD11	KD12	KD13	KD14	KD15
KS4	KD16	KD17	KD18	KD19	KD20
KS5	KD21	KD22	KD23	KD24	KD25
KS6	KD26	KD27	KD28	KD29	KD30

When the KS4/P4 to KS6/P2 output pins are set to function as the general-purpose output ports with the control data “KP1 and KP2”, and a key matrix of up to 15 keys is formed from the KS1 to KS3 output pins and the KI1 to KI5 input pins, the KD16 to KD30 key data bits will be set to 0.

## Key Scan Operation Functions

### 1. Key scan timing

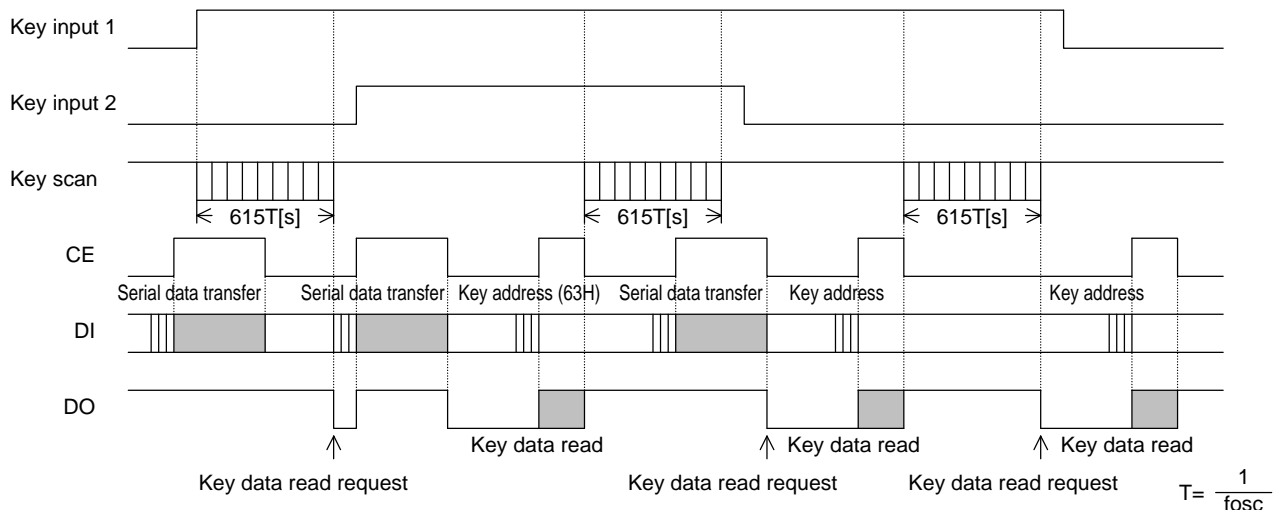

The key scan period is  $288T$  (s). To reliably determine the on/off state of the keys, this LSI scans the keys twice and determines that a key has been pressed when the key data agrees. It outputs a key data read request (a low level on DO)  $615T$  (s) after starting a key scan. If the key data does not agree and a key was pressed at that point, it scans the keys again. Thus this LSI cannot detect a key press shorter than  $615T$  (s).

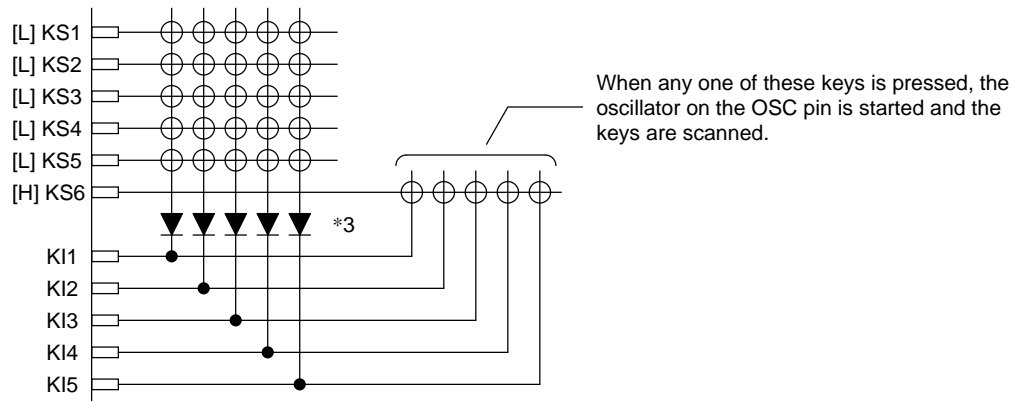

\*2. Not that the high/low states of these pins are determined by the control data, and that key scan output signals are not output from pins that are set to low.

### 2. Key scan operation

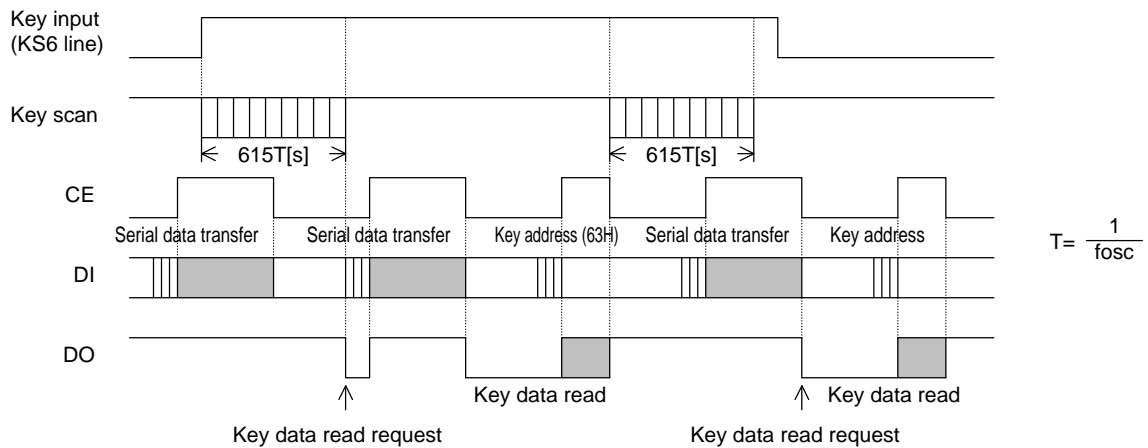

- The pins KS1 to KS6 are set to the high or low state by the control data.
- If a key on one of the lines corresponding to a KS1 to KS6 pin which is set high is pressed, the oscillator on the OSC pin is started and a key scan is performed. Keys are scanned until all keys are released. Multiple key presses are recognized by determining whether multiple key data bits are set.
- If a key is pressed for longer than  $615T$  (s) (where  $T = 1/f_{osc}$ ) this LSI outputs a key data read request (a low level on DO) to the controller. The controller acknowledges this request and reads the key data. However, if CE is high during a serial data transfer, DO will be set high.
- After the controller reads the key data, the key data read request is cleared (DO is set high) and this LSI performs another key scan. Also note that DO being an open-drain output, requires a pull-up resistor (between  $1\text{ k}\Omega$  and  $10\text{ k}\Omega$ ).

Example: When control data “KP1 and KP2 = 0, KC1 to KC5 = 0, KC6 = 1” are executed.  
(i.e. key scanning with only KS6 high.)

\*3. These diodes are required to reliably recognize multiple key presses of keys on the KS6 line when state with only KS6 high, as in the above example. That is, these diodes prevent incorrect operations due to sneak currents in the KS6 key scan output signal keys on the KS1 to KS5 lines are pressed at the same time.

### Multiple Key Presses

Although this LSI is capable of key scanning without inserting diodes for dual key presses, triple key presses on the KI1 to KI5 input pin lines, or multiple key presses on the KS1 to KS6 output pin lines, multiple presses other than these cases may result in keys that were not pressed recognized as having been pressed. Therefore, a diode must be inserted in series with each key. Applications that do not recognize multiple key presses of three or more keys should check the key data for three or more 1 bits and ignore such data.

## System Reset

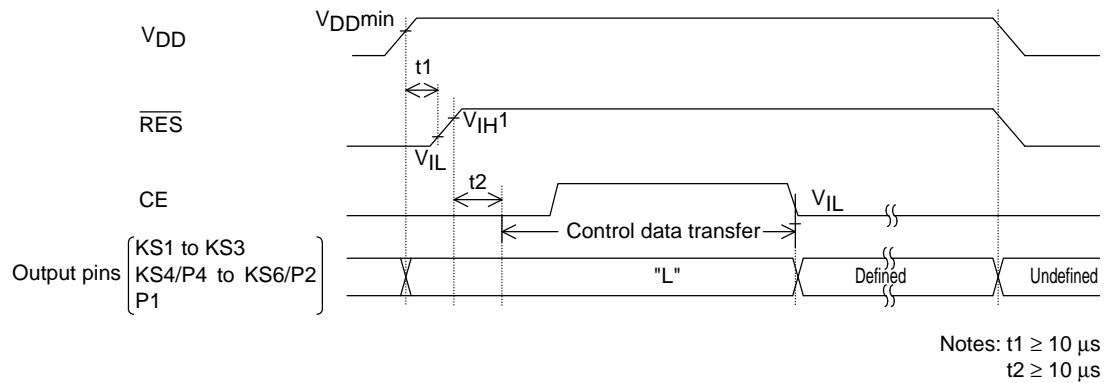

When the power is first applied, the state of function is undefined, so it must be initialized by  $\overline{\text{RES}} = \text{"L"}$

### 1. Reset methods

This LSI supports the reset methods described below.

When a system reset is applied, key scanning is disabled, the key data is reset, and the general-purpose output ports are set to and held at the low level ( $V_{SS}$ ).

Set  $\overline{\text{RES}} = \text{"H"}$  after the  $\overline{\text{RES}} = \text{"L"}$  period. And key scanning become possible by the control data are transferred.

### 2. Internal block states during the reset period.

#### • CLOCK GENERATOR

Reset is applied and the basic clock is stopped. (The oscillator on the OSC pin is stopped.)

#### • KEY SCAN, KEY BUFFER

Reset is applied, the circuit is set to the initial state, and at the same time the key scan operation is disabled.

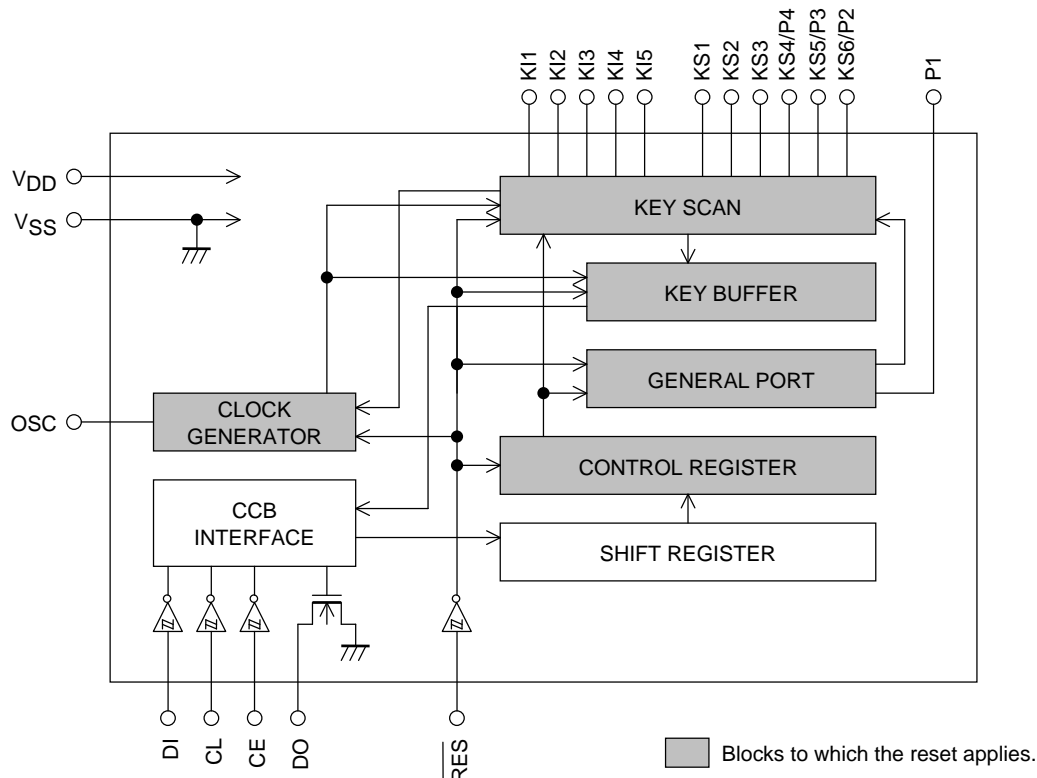

And all the key data is set to Low. Then, when the control data are transferred, the key scanning operation is enabled.

#### • GENERAL PORT

Reset is applied and the outputs of P1 to P4 are all set to the low level.

#### • CCB INTERFACE, SHIFT REGISTER, CONTROL REGISTER

When a reset is applied, The CONTROL REGISTER is forcibly initialized internally. Then, when control data are transferred, the LSI operates according to the control data.

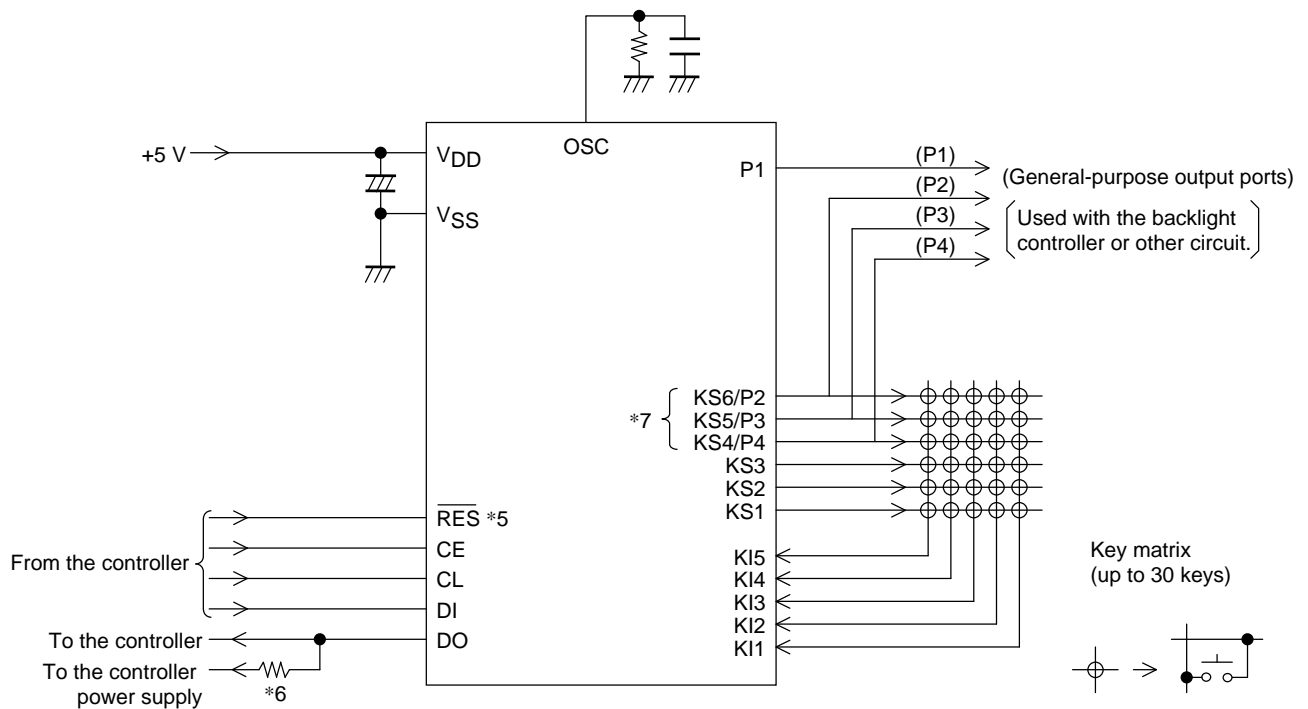

### 3. Output pin states during a reset

Output pins	State during a reset
KS1 to KS3	L
KS4/P4 to KS6/P2	L
P1	L
DO	H *4

\*4. Since this output pin is an open-drain output, a pull-up resistor of between 1 and 10 kΩ is required. This pin remains high during the reset period even if a key data read operation is performed.

### Sample Application Circuit

Note: \*5. When the power is first applied, it must be initialized by  $\overline{RES} = "L"$ .

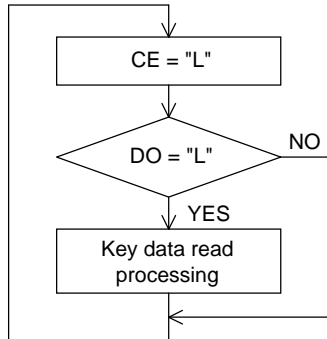

\*6. The DO pin, being an open-drain output, requires a pull-up resistor. Select a resistance (between 1 and 10 kΩ) appropriate for the capacitance of the external wiring so that signal waveforms are not degraded.

\*7. Each of The KS4/P4 to KS6/P2 pins must be set to either the key scan output port or the general-purpose output port.

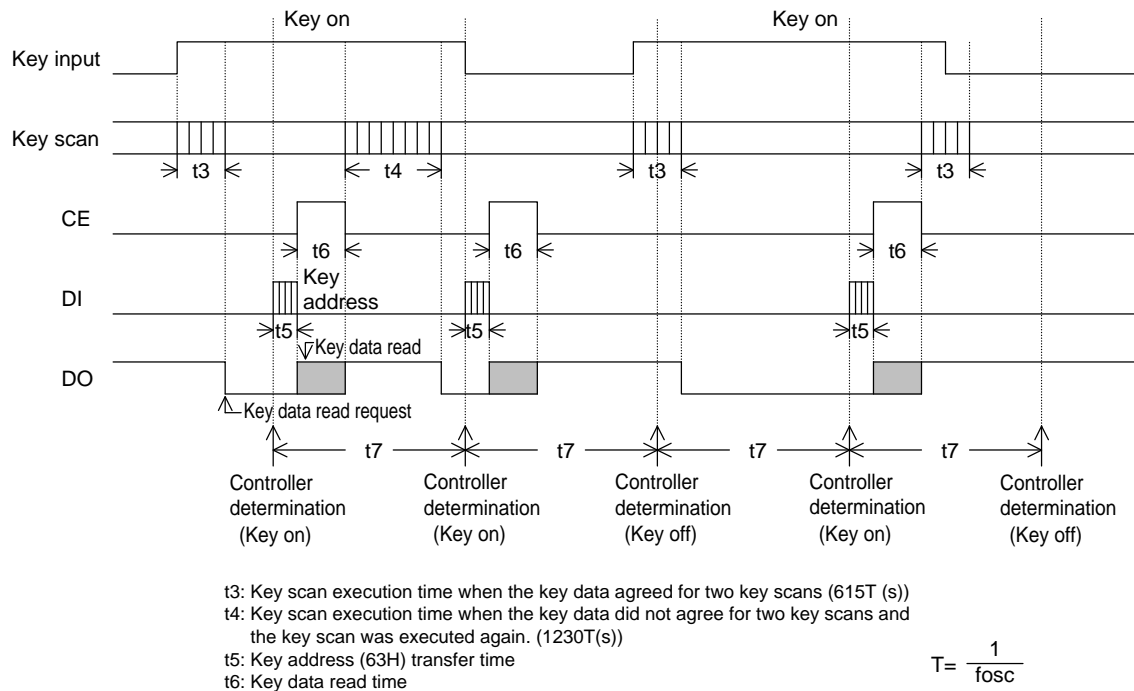

## Notes on the controller key data read techniques

### 1. Timer based key data acquisition

#### (1) Flowchart

#### (2) Timing chart

#### (3) Explanation

In this technique, the controller uses a timer to determine key on/off states and read the key data. The controller must check the DO state when CE is low every  $t7$  period without fail. If DO is low, the controller recognizes that a key has been pressed and executed the key data read operation.

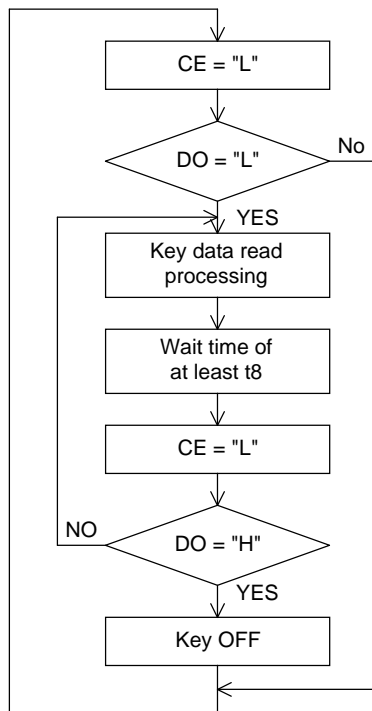

The period  $t7$  in this technique must satisfy the following condition.

$$t7 > t4 + t5 + t6$$

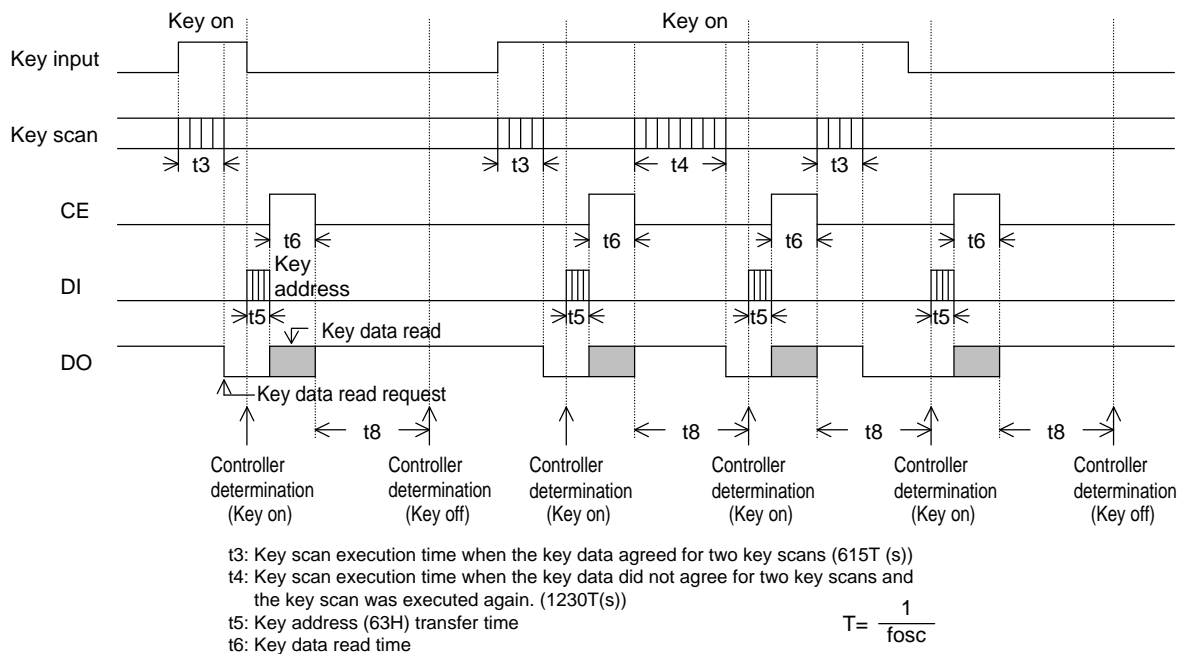

If a keydata read operation is executed when DO is high, the read key data (KD1 to KD30) will be invalid.

## 2. Interrupt based key data acquisition

## (1) Flowchart

## (2) Timing chart

## LC75700T

### (3) Explanation

In this technique, the controller uses interrupts to determine key on/off states and read the key data. The controller must check the DO state when CE is low. If DO is low, the controller recognizes that a key has been pressed and executes the key data read operation. After that the next key on/off determination is performed after the time  $t_8$  has elapsed by checking the DO state when CE is low and reading the key data.

The period  $t_8$  in this technique must satisfy the following condition.

$$t_8 > t_4$$

If a key data read operation is executed when DO is high, the read key data (KD1 to KD30) will be invalid.
