Ordering Information

Part Number	Marking Code	Voltage	Junction Temp. Range	Package
MIC5295-3.0YD	5295-30Y	3.0V	–40° to +125°C	5-Pin TO-252
MIC5295-3.3YD	5295-33Y	3.3V	–40° to +125°C	5-Pin TO-252
MIC5295-5.0YD	5295-50Y	5.0V	–40° to +125°C	5-Pin TO-252
MIC5295YD	5295YD	Adj	–40° to +125°C	5-Pin TO-252

Pin Configuration
5-Pin TO-252

Pin Description

Pin Number	Pin Name	Pin Function
1	EN	Enable (Input): Logic low = shutdown; logic high = enable. Do not leave floating.
2	VIN	Supply Input.
3	GND	Ground.
4	VOUT	Regulator Output.
5	NC(fixed)	No Connect.
	ADJ(adj)	Adjust (Input): Feedback input. Connect to resistive Voltage-divider network.

Absolute Maximum Ratings[1]

Input Supply Voltage .... –20V to 38V
Enable Input Voltage .... –0.3V to 38V
Power Dissipation .... Internally Limited
Junction Temperature .... –40°C to +125°C
Storage Temperature .... –65°C to +150°C
ESD Rating[3] .... ESD Sensitive

Operating Ratings[2]

Input Supply Voltage .... 2.3V to 24V
Enable Input Voltage .... 0V to 24V
Junction Thermal .... –40°C to +125°C
Package Thermal Resistance
    TO-252-5 (θ_{JA}) .... 50°C/W

Electrical Characteristics[4]

$V_{IN} = V_{OUT} + 1V$; $I_{OUT} = 100\mu A$; $C_{IN} = 1.0\mu F$, $C_{OUT} = 2.2\mu A$; $T_J = 25°C$, **bold** values indicate $-40°C < T_J < +125°C$; unless otherwise specified.

| Parameter	Condition	Min	Typ	Max	Units
Output Voltage Accuracy	Variation from nominal V_{OUT}	–1.0 **–2.0**		+1.0 **+2.0**	% %
Line Regulation	$V_{IN} = V_{OUT} + 1V$ to 24V		0.04		%
Load Regulation	Load = 100µA to 150mA		0.25	1	%
Dropout Voltage	$I_{OUT} = 100\mu A$		45		mV
	$I_{OUT} = 50mA$		220	**400**	mV
	$I_{OUT} = 100mA$		260	**450**	mV
	$I_{OUT} = 150mA$		300	**500**	mV
Reference Voltage			1.24		V
		-1.0		+1.0	%
Ground Current	$I_{OUT} = 100\mu A$		18	30 **35**	µA µA
	$I_{OUT} = 50mA$		0.35	0.7	mA
	$I_{OUT} = 100mA$		1	2	mA
	$I_{OUT} = 150mA$		2	4	mA
Ground Current in Shutdown	$V_{EN} = 0V$; $V_{IN} = 24V$		0.1	1	µA
Current Limit	$V_{OUT} = 0V$		350	500	mA
Ripple Rejection	f = 1kHz		50		dB
Output Voltage Noise	10Hz to 100kHz		47		μV_{RMS}
Output Leakage, Reverse Polarity Input	Load = 500Ω; $V_{IN} = -15V$; $V_{EN} = 0.4V$		–0.1		µA

Enable Input

| Parameter	Condition	Min	Typ	Max	Units
Enable turn on time			1.2	10	ms
Input Low Voltage	Regulator OFF			**0.4**	V
Input High Voltage	Regulator ON	**2.0**			V
Enable Input Current	$V_{EN} = 0.6V$; Regulator OFF	–1.0	0.01	1.0	µA
	$V_{EN} = 2.0V$; Regulator ON		0.1	1.0	µA
	$V_{EN} = 24V$; Regulator ON		0.5	2.5	µA

Notes:

1. Exceeding the absolute maximum rating may damage the device.

2. The device is not guaranteed to function outside its operating rating.

3. Devices are ESD sensitive. Handling precautions recommended. Human body model, 1.5kΩ in series with 100pF.

4. Specification for packaged product only.

Application Information

Enable/Shutdown

The MIC5295 comes with an active-high enable pin that allows the regulator to be disabled. Forcing the enable pin low disables the regulator and sends it into a "zero" off-mode-current state. In this state, current consumed by the regulator goes nearly to zero. Forcing the enable pin high enables the output voltage. Do not leave this pin floating as the output will be in indeterminate state.

Input Capacitor

The MIC5295 has high input voltage capability up to 24V. The input capacitor must be rated to sustain voltages that may be used on the input. An input capacitor may be required when the device is not near the source power supply or when supplied by a battery. Small, surface mount, ceramic capacitors can be used for bypassing. Larger values may be required if the source supply has high ripple.

Output Capacitor

The MIC5295 requires an output capacitor for stability. The design requires 2.2µF or greater on the output to maintain stability. The design is optimized for use with low-ESR ceramic chip capacitors. High ESR capacitors may cause high frequency oscillation. The maximum recommended ESR is 3Ω. The output capacitor can be increased without limit. Larger valued capacitors help to improve transient response.

X7R/X5R dielectric-type ceramic capacitors are recommended because of their temperature performance. X7R-type capacitors change capacitance by 15% over their operating temperature range and are the most stable type of ceramic capacitors. Z5U and Y5V dielectric capacitors change value by as much as 50% and 60% respectively over their operating temperature ranges. To use a ceramic chip capacitor with Y5V dielectric, the value must be much higher than a X7R ceramic capacitor to ensure the same minimum capacitance over the equivalent operating temperature range.

No-Load Stability

The MIC5295 will remain stable with no load unlike many other voltage regulators. This is especially important in CMOS RAM keep-alive applications.

Thermal Considerations

The MIC5295 is designed to provide 150mA of continuous current in a small package. Maximum ambient operating temperature can be calculated based on the output current and the voltage drop across the part. For example, given that the input voltage of 3.3V the output voltage is 2.3V and the output current = 150mA. The actual power dissipation of the regulator circuit can be determined using the equation:

$$P_D = (V_{IN} - V_{OUT})I_{OUT} + V_{IN} \times I_{GND}$$

Due to the potential for input voltages up to 24V, ground current must be taken into consideration.

$$P_{D(MAX)} = (3.3 - 2.3V)150mA + 3.3x\ 1.2mA$$

$$P_{D(MAX)} = 0.154W$$

The junction-to-ambient thermal resistance for the MIC5295, D-Pak is 50°C/W. To determine the maximum ambient operating temperature of the package, use the junction-to-ambient thermal resistance of the device and the following basic equation:

$$P_{D(MAX)} = \left(\frac{T_{J(MAX)} - T_A}{\theta_{JA}} \right)$$

$T_{J(MAX)}$ is the maximum junction temperature of the die, 125°C, the maximum ambient temperature can be calculated to be 117.3°C as shown below:

$$0.154W = \left(\frac{125°C - T_A}{50°C/W} \right)$$

$$T_A = 117.3°C$$

Adjustable Regulator Application

The MIC5295YD can be adjusted from 1.24V to 20V by using two external resistors (Figure 1). The resistors set the output voltage based on the following equation:

$$V_{OUT} = V_{REF} \left(1 + \left(\frac{R_1}{R_2} \right) \right)$$

Where V_{REF} = 1.24V.
Feedback resistor R2 should be no larger than 300kΩ.
