

# Addendum to Rev. 9 of the MC9S08LG32 Series Covers: MC9S08LG32 and MC9S08LG16

This addendum identifies changes to Rev. 9 of the MC9S08LG32 Series data sheet (covering MC9S08LG32 and MC9S08LG16). The changes described in this addendum have not been implemented in the specified pages.

## 1 Add min values for $I_{IC}$ (DC injection current)

<b>Location:</b>	<a href="#">Table 8. DC Characteristics, Page 14</a>
------------------	--

In Table 8, “DC Characteristics,” add min values for  $I_{IC}$  (row number 14) as follows:

Num	C	Characteristic		Symbol	Min	Typ <sup>1</sup>	Max	Unit
14	D	DC injection current <sup>5, 6, 7</sup> $V_{IN} < V_{SS}$ (min) $V_{IN} > V_{DD}$ (max)	Single pin limit	$I_{IC}$	-0.2	—	2	mA
			Total MCU limit, includes sum of all stressed pins		-5	—	25	mA

## 2 Change the max value of $t_{LPO}$ (low power oscillator period)

<b>Location:</b>	<a href="#">Table 14. Control Timing, Page 29</a>
------------------	---

In Table 14, “Control Timing,” change the max value of  $t_{LPO}$  (row number 2) from 1300 to 1500  $\mu$ s.

## MC9S08LG32 Series

### Covers: MC9S08LG32 and MC9S08LG16

#### Features

- 8-bit HCS08 Central Processor Unit (CPU)
    - Up to 40 MHz CPU at 5.5 V to 2.7 V across temperature range of  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$  and  $-40^{\circ}\text{C}$  to  $105^{\circ}\text{C}$
    - HCS08 instruction set with added BGND instruction
    - Support for up to 32 interrupt/reset sources
  - On-Chip Memory
    - 32 KB or 18 KB dual array flash; read/program/erase over full operating voltage and temperature
    - 1984 byte random access memory (RAM)
    - Security circuitry to prevent unauthorized access to RAM and flash contents
  - Power-Saving Modes
    - Two low-power stop modes (stop2 and stop3)
    - Reduced-power wait mode
    - Peripheral clock gating register can disable clocks to unused modules, thereby reducing currents
    - Low power On-Chip crystal oscillator (XOSC) that can be used in low-power modes to provide accurate clock source to real time counter and LCD controller
    - 100  $\mu\text{s}$  typical wakeup time from stop3 mode
  - Clock Source Options
    - Oscillator (XOSC) — Loop-control Pierce oscillator; crystal or ceramic resonator range of 31.25 kHz to 38.4 kHz or 1 MHz to 16 MHz
    - Internal Clock Source (ICS) — Internal clock source module containing a frequency-locked-loop (FLL) controlled by internal or external reference; precision trimming of internal reference allows 0.2% resolution and 2% deviation over temperature and voltage; supports bus frequencies from 1 MHz to 20 MHz.
  - System Protection
    - COP reset with option to run from dedicated 1 kHz internal clock or bus clock
    - Low-voltage warning with interrupt
    - Low-voltage detection with reset
    - Illegal opcode detection with reset
    - Illegal address detection with reset
    - Flash and RAM protection
  - Development Support
    - Single-wire background debug interface
    - Breakpoint capability to allow single breakpoint setting during in-circuit debugging and plus two more breakpoints in On-Chip debug module
- On-Chip in-circuit emulator (ICE) debug module containing three comparators and nine trigger modes; eight deep FIFO for storing change-of-flow addresses and event-only data; debug module supports both tag and force breakpoints
  - Peripherals
    - **LCD** — Up to  $4 \times 41$  or  $8 \times 37$  LCD driver with internal charge pump.
    - **ADC** — Up to 16-channel, 12-bit resolution, 2.5  $\mu\text{s}$  conversion time, automatic compare function, temperature sensor, internal bandgap reference channel, runs in stop3 and can wake up the system, fully functional from 5.5 V to 2.7 V
    - **SCI** — Full duplex non-return to zero (NRZ), LIN master extended break generation, LIN slave extended break detection, wakeup on active edge
    - **SPI** — Full-duplex or single-wire bidirectional, double-buffered transmit and receive, master or slave mode, MSB-first or LSB-first shifting
    - **IIC** — With up to 100 kbps with maximum bus loading, multi-master operation, programmable slave address, interrupt driven byte-by-byte data transfer, supports broadcast mode and 10-bit addressing
    - **TPMx** — One 6 channel and one 2 channel, selectable input capture, output compare, or buffered edge or center-aligned PWM on each channel
    - **MTIM** — 8-bit counter with match register, four clock sources with prescaler dividers, can be used for periodic wakeup
    - **RTC** — 8-bit modulus counter with binary or decimal based prescaler, three clock sources including one external source, can be used for time base, calendar, or task scheduling functions
    - **KBI** — One keyboard control module capable of supporting  $8 \times 8$  keyboard matrix
    - **IRQ** — External pin for wakeup from low-power modes
  - Input/Output
    - 39, 53, or 69 GPIOs
    - 8 KBI and 1 IRQ interrupt with selectable polarity
    - Hysteresis and configurable pullup device on all input pins, configurable slew rate and drive strength on all output pins.
  - Package Options
    - 48-pin LQFP, 64-pin LQFP, and 80-pin LQFP

80-LQFP  
Case 917A  
14 mm  $\times$  14 mm

64-LQFP  
Case 840F  
10 mm  $\times$  10 mm

48-LQFP  
Case 932  
7 mm  $\times$  7mm

## 2 Electrical Characteristics

### 2.1 Introduction

This section contains electrical and timing specifications for the MC9S08LG32 series of microcontrollers available at the time of publication.

### 2.2 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

**Table 3. Parameter Classifications**

<b>P</b>	Those parameters are guaranteed during production testing on each individual device.
<b>C</b>	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
<b>T</b>	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
<b>D</b>	Those parameters are derived mainly from simulations.

#### NOTE

The classification is shown in the column labeled “C” in the parameter tables where appropriate.

### 2.3 Absolute Maximum Ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in [Table 4](#) may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this section.

This device contains circuitry that protects against damage due to high static voltage or electrical fields. However, it is advised that normal precautions should be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either  $V_{SS}$  or  $V_{DD}$ ) or the programmable pull-up resistor associated with the pin is enabled.

**Table 4. Absolute Maximum Ratings**

Rating	Symbol	Value	Unit
Supply voltage	$V_{DD}$	−0.3 to +5.8	V
Maximum current into $V_{DD}$	$I_{DD}$	120	mA
Digital input voltage	$V_{In}$	−0.3 to $V_{DD} + 0.3$	V
Instantaneous maximum current Single pin limit (applies to all port pins) <sup>1, 2, 3</sup>	$I_D$	±25 ±2	mA
Storage temperature range	$T_{stg}$	−55 to 150	°C

- <sup>1</sup> Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive ( $V_{DD}$ ) and negative ( $V_{SS}$ ) clamp voltages and use the largest of the two resistance values.
- <sup>2</sup> All functional non-supply pins are internally clamped to  $V_{SS}$  and  $V_{DD}$ .
- <sup>3</sup> Power supply must maintain regulation within operating  $V_{DD}$  range during instantaneous and operating maximum current conditions. If positive injection current ( $V_{In} > V_{DD}$ ) is greater than  $I_{DD}$ , the injection current may flow out of  $V_{DD}$  and could result in an external power supply going out of regulation. Ensure that the external  $V_{DD}$  load will shunt current greater than maximum injection current, this will be of greater risk when the MCU is not consuming power. For instance, if no system clock is present, or if the clock rate is very low (which would reduce overall power consumption).

## 2.4 Thermal Characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in On-Chip logic and voltage regulator circuits, and it is user-determined rather than being controlled by the MCU design. To take  $P_{I/O}$  into account in power calculations, determine the difference between actual pin voltage and  $V_{SS}$  or  $V_{DD}$  and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and  $V_{SS}$  or  $V_{DD}$  will be very small.

**Table 5. Thermal Characteristics**

Rating	Symbol	Value	Unit
Operating temperature range (packaged)	$T_A$	$T_L$ to $T_H$ −40 to +105	°C
Maximum junction temperature	$T_J$	125	°C
Thermal resistance Single-layer board 80-pin LQFP 64-pin LQFP 48-pin LQFP	$\theta_{JA}$	61 71 80	°C/W
Thermal resistance Four-layer board 80-pin LQFP 64-pin LQFP 48-pin LQFP	$\theta_{JA}$	48 52 56	°C/W

The average chip-junction temperature ( $T_J$ ) in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA}) \quad \text{Eqn. 1}$$

## Electrical Characteristics

where:

$T_A$  = Ambient temperature, °C

$\theta_{JA}$  = Package thermal resistance, junction-to-ambient, °C/W

$P_D = P_{int} + P_{I/O}$

$P_{int} = I_{DD} \times V_{DD}$ , Watts — chip internal power

$P_{I/O}$  = Power dissipation on input and output pins — user determined

For most applications,  $P_{I/O} \ll P_{int}$  and can be neglected. An approximate relationship between  $P_D$  and  $T_J$  (if  $P_{I/O}$  is neglected) is:

$$P_D = K \div (T_J + 273 \text{ }^{\circ}\text{C}) \quad \text{Eqn. 2}$$

Solving Equation 1 and Equation 2 for K gives:

$$K = P_D \times (T_A + 273 \text{ }^{\circ}\text{C}) + \theta_{JA} \times (P_D)^2 \quad \text{Eqn. 3}$$

where K is a constant pertaining to the particular part. K can be determined from equation 3 by measuring  $P_D$  (at equilibrium) for a known  $T_A$ . Using this value of K, the values of  $P_D$  and  $T_J$  can be obtained by solving Equation 1 and Equation 2 iteratively for any value of  $T_A$ .

## 2.5 ESD Protection and Latch-Up Immunity

Although damage from electrostatic discharge (ESD) is much less common on these devices than on early CMOS circuits, normal handling precautions should be taken to avoid exposure to static discharge. Qualification tests are performed to ensure that these devices can withstand exposure to reasonable levels of static without suffering any permanent damage.

All ESD testing is in conformity with AEC-Q100 Stress Test Qualification for automotive grade integrated circuits. During the device qualification, ESD stresses were performed for the human body model (HBM), the machine model (MM) and the charge device model (CDM).

A device is defined as a failure if after exposure to ESD pulses the device no longer meets the device specification. Complete DC parametric and functional testing is performed per the applicable device specification at room temperature followed by hot temperature, unless instructed otherwise in the device specification.

**Table 6. ESD and Latch-Up Test Conditions**

Model	Description	Symbol	Value	Unit
Human Body Model	Series resistance	R1	1500	Ω
	Storage capacitance	C	100	pF
	Number of pulses per pin	—	3	—
Latch-up	Minimum input voltage limit	—	−2.5	V
	Maximum input voltage limit	—	7.5	V

Table 7. ESD and Latch-Up Protection Characteristics

No.	Rating <sup>1</sup>	Symbol	Min	Max	Unit
1	Human body model (HBM)	$V_{HBM}$	2500	—	V
2	Charge device model (CDM)	$V_{CDM}$	750	—	V
3	Latch-up current at $T_A = 85\text{ }^{\circ}\text{C}$	$I_{LAT}$	$\pm 100$	—	mA

<sup>1</sup> Parameter is achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted.

## 2.6 DC Characteristics

This section includes information about power supply requirements and I/O pin characteristics.

<sup>1</sup> Typical values are measured at 25 °C. Characterized, not tested

<sup>2</sup> Measured with  $V_{In} = V_{DD}$  or  $V_{SS}$ .

<sup>3</sup> Measured with  $V_{In} = V_{SS}$ .

<sup>4</sup> Measured with  $V_{In} = V_{DD}$ .

<sup>5</sup> All functional non-supply pins, except for PTC6 are internally clamped to  $V_{SS}$  and  $V_{DD}$ .

<sup>6</sup> Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.

<sup>7</sup> Power supply must maintain regulation within operating  $V_{DD}$  range during instantaneous and operating maximum current conditions. If the positive injection current ( $V_{In} > V_{DD}$ ) is greater than  $I_{DD}$ , the injection current may flow out of  $V_{DD}$  and could result in external power supply going out of regulation. Ensure that external  $V_{DD}$  load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. For instance, if no system clock is present, or if clock rate is very low (which would reduce overall power consumption).

11	C	Long term jitter of DCO output clock (averaged over 2 ms interval) <sup>5</sup>	$C_{Jitter}$	—	0.02	0.2	% $f_{dco}$

<sup>1</sup> Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.

<sup>2</sup> The resulting bus clock frequency should not exceed the maximum specified bus clock frequency of the device.

<sup>3</sup> This parameter is characterized and not tested on each device.

<sup>4</sup> This specification applies to any time the FLL reference source or reference divider is changed, trim value changed or changing from FLL disabled (FBELP, FBILP) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

<sup>5</sup> Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum  $f_{BUS}$ . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via V<sub>DD</sub> and V<sub>SS</sub> and variation in the crystal oscillator frequency increase the  $C_{Jitter}$  percentage for a given interval.

<sup>1</sup> Typical values are based on characterization data at  $V_{DD} = 5.0 V$ , 25 °C unless otherwise stated.

<sup>2</sup> This is the shortest pulse that is guaranteed to be recognized as a reset pin request.

<sup>3</sup> To enter BDM mode following a POR, BKGD/MS should be held low during the power-up and for a hold time of  $t_{MSH}$  after  $V_{DD}$  rises above  $V_{LVD}$ .

<sup>4</sup> This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In stop mode, the synchronizer is bypassed so shorter pulses can be recognized.

<sup>5</sup> Timing is shown with respect to 20%  $V_{DD}$  and 80%  $V_{DD}$  levels. Temperature range –40 °C to 105 °C.

<sup>6</sup> Except for LCD pins in Open Drain mode.

## 2.13 Flash Specifications

This section provides details about program/erase times and program-erase endurance for the flash memory.

Program and erase operations do not require any special power sources other than the normal V<sub>DD</sub> supply. For more detailed information about program/erase operations, see the Memory section.

Table 18. Flash Characteristics

C	Characteristic	Symbol	Min	Typical	Max	Unit
D	Supply voltage for program/erase –40 °C to 85 °C	V <sub>prog/erase</sub>	2.7		5.5	V

C	Data retention <sup>5</sup>	t <sub>D_ret</sub>	15	100	—	years

<sup>1</sup> The frequency of this clock is controlled by a software setting.

<sup>2</sup> These values are hardware state machine controlled. User code does not need to count cycles. This information supplied for calculating approximate time to program and erase.

<sup>3</sup> The program and erase currents are additional to the standard run I<sub>DD</sub>. These values are measured at room temperatures with V<sub>DD</sub> = 5.0 V, bus frequency = 4.0 MHz.

<sup>4</sup> **Typical endurance for flash** was evaluated for this product family on the 9S12Dx64. For additional information on how Freescale defines typical endurance, please refer to *Engineering Bulletin EB619, Typical Endurance for Nonvolatile Memory*.

<sup>5</sup> **Typical data retention** values are based on intrinsic capability of the technology measured at high temperature and de-rated to 25 °C using the Arrhenius equation. For additional information on how Freescale defines typical data retention, please refer to *Engineering Bulletin EB618, Typical Data Retention for Nonvolatile Memory*.

## 2.14 EMC Performance

Electromagnetic compatibility (EMC) performance is highly dependant on the environment in which the MCU resides. Board design and layout, circuit topology choices, location and characteristics of external components as well as MCU software operation all play a significant role in EMC performance. The system designer should consult Freescale applications notes such as AN2321, AN1050, AN1263, AN2764, and AN1259 for advice and guidance specifically targeted at optimizing EMC performance.

### 2.14.1 Radiated Emissions

Microcontroller radiated RF emissions are measured from 150 kHz to 1 GHz using the TEM/GTEM cell method in accordance with the IEC 61967-2 and SAE J1752/3 standards. The measurement is performed with the microcontroller installed on a custom EMC evaluation board while running specialized EMC test software. The radiated emissions from the microcontroller are measured in a TEM cell in two package orientations (North and East).

The maximum radiated RF emissions of the tested configuration in all orientations are less than or equal to the reported emissions levels.

**Table 19. Radiated Emissions, Electric Field**

Parameter	Symbol	Conditions	Frequency	$f_{osc}/f_{BUS}$	Level <sup>1</sup> (Max)	Unit

### 2.14.2 Conducted Transient Susceptibility

Microcontroller transient conducted susceptibility is measured in accordance with an internal Freescale test method. The measurement is performed with the microcontroller installed on a custom EMC evaluation board and running specialized EMC test software designed in compliance with the test method. The conducted susceptibility is determined by injecting the transient susceptibility signal on each pin of the microcontroller. The transient waveform and injection methodology is based on IEC 61000-4-4 (EFT/B). The transient voltage required to cause performance degradation on any pin in the tested configuration is greater than or equal to the reported levels unless otherwise indicated by footnotes below [Table 20](#).

**Table 20. Conducted Susceptibility, EFT/B**

## Ordering Information

The susceptibility performance classification is described in [Table 21](#).

**Table 21. Susceptibility Performance Classification**

Result	Performance Criteria	
A	No failure	The MCU performs as designed during and after exposure.
B	Self-recovering failure	The MCU does not perform as designed during exposure. The MCU returns automatically to normal operation after exposure is removed.
C	Soft failure	The MCU does not perform as designed during exposure. The MCU does not return to normal operation until exposure is removed and the RESET pin is asserted.
D	Hard failure	The MCU does not perform as designed during exposure. The MCU does not return to normal operation until exposure is removed and the power to the MCU is cycled.
E	Damage	The MCU does not perform as designed during and after exposure. The MCU cannot be returned to proper operation due to physical damage or other permanent performance degradation.
