

1. Description

The Atmel® T5750C is a PLL transmitter IC which has been developed for the demands of RF low-cost transmission systems at data rates up to 32kBaud. The transmitting frequency range is 868 MHz to 928 MHz. It can be used in both FSK and ASK systems.

2. Pin Configuration

Figure 2-1. Pinning TSSOP8L

Table 2-1. Pin Description

Pin	Symbol	Function	Configuration
1	CLK	Clock output signal for micro con roller The clock output frequency is set by the crystal to $f_{XTAL}/4$	
2	PA_ENABLE	Switches on power amplifier, used for ASK modulation	
3	ANT2	Emitter of antenna output stage	
4	ANT1	Open collector antenna output	

Table 2-1. Pin Description (Continued)

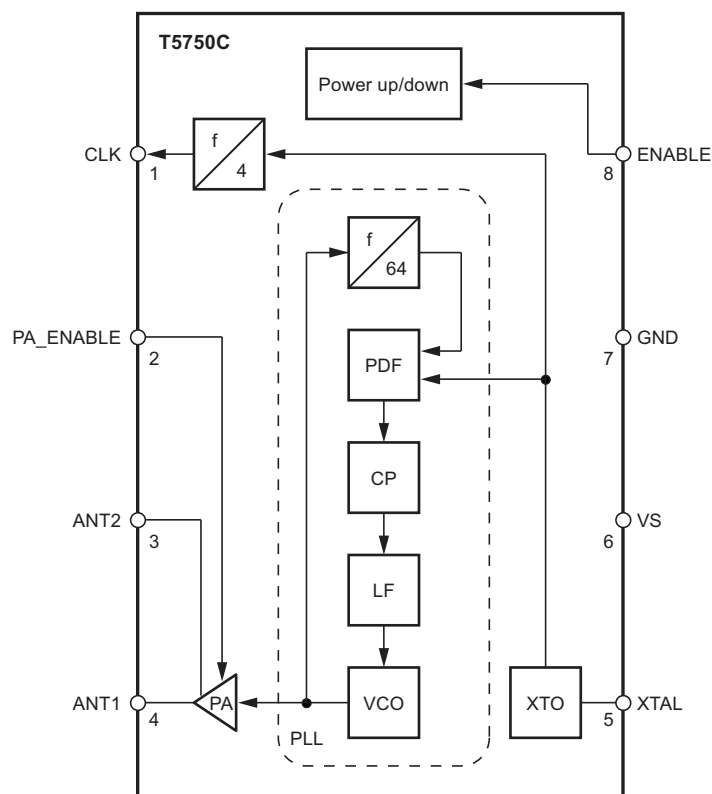

Pin	Symbol	Function	Configuration
5	XTAL	Connection for crystal	
6	VS	Supply voltage	See ESD protection circuitry (see Figure 4-5 on page 8)
7	GND	Ground	See ESD protection circuitry (see Figure 4-5 on page 8)
8	ENABLE	Enable input	

Figure 2-2. Block Diagram

3. General Description

This fully integrated PLL transmitter allows particularly simple, low-cost RF miniature transmitters to be assembled. The VCO is locked to $64 \times f_{XTAL}$ hence a 13.5672MHz crystal is needed for a 868.3MHz transmitter and a 14.2969MHz crystal for a 915MHz transmitter. All other PLL and VCO peripheral elements are integrated.

The XTO is a series resonance oscillator so that only one capacitor together with a crystal connected in series to GND are needed as external elements.

The crystal oscillator together with the PLL needs typically $< 1\text{ms}$ until the PLL is locked and the CLK output is stable. There is a wait time of $\geq 4\text{ms}$ must be used until the CLK is used for the microcontroller and the PA is switched on.

The power amplifier is an open-collector output delivering a current pulse which is nearly independent from the load impedance. The delivered output power is hence controllable via the connected load impedance.

This output configuration enables a simple matching to any kind of antenna or to 50Ω . A high power efficiency of $\eta = P_{out}/(I_{S,PA} \times V_S)$ of 24% for the power amplifier at 868.3 MHz results when an optimized load impedance of $Z_{Load} = (166 + j226)\Omega$ is used at 3V supply voltage.

4. Functional Description

If ENABLE = L and the PA_ENABLE = L, the circuit is in standby mode consuming only a very small amount of current, so that a lithium cell used as power supply can work for several years.

With ENABLE = H the XTO, PLL and the CLK driver are switched on. If PA_ENABLE remains L only the PLL and the XTO is running and the CLK signal is delivered to the microcontroller. The VCO locks to 64 times the XTO frequency.

With ENABLE = H and PA_ENABLE = H the PLL, XTO, CLK driver and the power amplifier are on. With PA_ENABLE the power amplifier can be switched on and off, which is used to perform the ASK modulation.

4.1 ASK Transmission

The Atmel® T5750C is activated by ENABLE = H. PA_ENABLE must remain L for $t \geq 4\text{ms}$, then the CLK signal can be taken to clock the microcontroller and the output power can be modulated by means of pin PA_ENABLE. After transmission PA_ENABLE is switched to L and the microcontroller switches back to internal clocking. The Atmel T5750C is switched back to standby mode with ENABLE = L.

4.2 FSK Transmission

The Atmel T5750C is activated by ENABLE = H. PA_ENABLE must remain L for $t \geq 4\text{ms}$, then the CLK signal can be taken to clock the microcontroller and the power amplifier is switched on with PA_ENABLE = H. The chip is then ready for FSK modulation. The microcontroller starts to switch on and off the capacitor between the XTAL load capacitor and GND with an open-drain output port, thus changing the reference frequency of the PLL. If the switch is closed, the output frequency is lower than if the switch is open. After transmission PA_ENABLE is switched to L and the microcontroller switches back to internal clocking. The Atmel T5750C is switched back to standby mode with ENABLE = L.

The accuracy of the frequency deviation with XTAL pulling method is about $\pm 25\%$ when the following tolerances are considered.

Figure 4-1. Tolerances of Frequency Modulation

Using $C_4 = 9.2\text{pF} \pm 2\%$, $C_5 = 6.8\text{pF} \pm 5\%$, a switch port with $C_{Switch} = 3\text{pF} \pm 10\%$, stray capacitances on each side of the crystal of $C_{Stray1} = C_{Stray2} = 1\text{pF} \pm 10\%$, a parallel capacitance of the crystal of $C_0 = 3.2\text{pF} \pm 10\%$ and a crystal with $C_M = 13\text{fF} \pm 10\%$, an FSK deviation of $\pm 21.5\text{kHz}$ typical with worst case tolerances of $\pm 16.8\text{kHz}$ to $\pm 28.0\text{kHz}$ results.

4.3 CLK Output

An output CLK signal is provided for a connected microcontroller, the delivered signal is CMOS compatible if the load capacitance is lower than 10pF.

4.3.1 Clock Pulse Take-over

The clock of the crystal oscillator can be used for clocking the microcontroller. Atmel®'s ATARx9x has the special feature of starting with an integrated RC-oscillator to switch on the T5750C with ENABLE = H, and after 4 ms to assume the clock signal of the transmission IC, so that the message can be sent with crystal accuracy.

4.3.2 Output Matching and Power Setting

The output power is set by the load impedance of the antenna. The maximum output power is achieved with a load impedance of $Z_{\text{Load,opt}} = (166 + j226)\Omega$ at 868.3MHz. There must be a low resistive path to V_S to deliver the DC current.

The delivered current pulse of the power amplifier is 7.7mA and the maximum output power is delivered to a resistive load of 475Ω if the 0.53pF output capacitance of the power amplifier is compensated by the load impedance.

An optimum load impedance of:

$Z_{\text{Load}} = 475\Omega \parallel j/(2 \times \pi \times f \times 0.53\text{pF}) = (166 + j226)\Omega$ thus results for the maximum output power of 5.5dBm.

The load impedance is defined as the impedance seen from the Atmel T5750C's ANT1, ANT2 into the matching network. Do not confuse this large signal load impedance with a small signal input impedance delivered as input characteristic of RF amplifiers and measured from the application into the IC instead of from the IC into the application for a power amplifier.

Less output power is achieved by lowering the real parallel part of 475Ω where the parallel imaginary part should be kept constant.

Output power measurement can be done with the circuit of [Figure 4-2 on page 6](#). Note that the component values must be changed to compensate the individual board parasitics until the Atmel T5750C has the right load impedance

$Z_{\text{Load,opt}} = (166 + j226)\Omega$ at 868.3MHz. Also the damping of the cable used to measure the output power must be calibrated out.

Figure 4-2. Output Power Measurement

4.4 Application Circuit

For the supply-voltage blocking capacitor C_3 a value of 68nF/X7R is recommended (see [Figure 4-3 on page 7](#) and [Figure 4-4 on page 8](#)). C_1 and C_2 are used to match the loop antenna to the power amplifier where C_1 typically is 3.9pF/NP0 and C_2 is 1pF/NP0; for C_2 two capacitors in series should be used to achieve a better tolerance value and to have the possibility to realize the $Z_{\text{Load,opt}}$ by using standard valued capacitors.

C_1 forms together with the pins of Atmel T5750C and the PCB board wires a series resonance loop that suppresses the 1st harmonic, hence the position of C_1 on the PCB is important. Normally the best suppression is achieved when C_1 is placed as close as possible to the pins ANT1 and ANT2.

The loop antenna should not exceed a width of 1.5mm, otherwise the Q-factor of the loop antenna is too high.

L_1 ($\approx 50\text{nH}$ to 100nH) can be printed on PCB. C_4 should be selected so that the XTO runs on the load resonance frequency of the crystal. Normally, a value of 12pF results for a 15pF load-capacitance crystal.

5. Absolute Maximum Ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Parameters	Symbol	Minimum	Maximum	Unit
Supply voltage	V_S		5	V
Power dissipation	P_{tot}		100	mW
Junction temperature	T_j		150	°C
Storage temperature	T_{stg}	–55	125	°C
Ambient temperature	T_{amb}	–55	125	°C
Input voltage	V_{maxPA_ENABLE}	–0.3	$(V_S + 0.3)^{(1)}$	V

Note: 1. If $V_S + 0.3$ is higher than 3.7V, the maximum voltage will be reduced to 3.7V.

6. Thermal Resistance

Parameters	Symbol	Value	Unit
Junction ambient	R_{thJA}	170	K/W

7. Electrical Characteristics

$V_S = 2.0V$ to $4.0V$, $T_{amb} = -40^{\circ}C$ to $125^{\circ}C$ unless otherwise specified.

Typical values are given at $V_S = 3.0V$ and $T_{amb} = 25^{\circ}C$. All parameters are referred to GND (pin 7).

Parameters	Test Conditions	Symbol	Min.	Typ.	Max.	Unit
Supply current	Power down, $V_{ENABLE} < 0.25V$, $-40^{\circ}C$ to $85^{\circ}C$ $V_{PA_ENABLE} < 0.25V$, $-85^{\circ}C$ to $+125^{\circ}C$ $V_{PA_ENABLE} < 0.25V$, $25^{\circ}C$ (100% correlation tested)	I_{S_Off}		<10	350 7	nA μA nA
Supply current	Power up, PA off, $V_S = 3V$, $V_{ENABLE} > 1.7V$, $V_{PA_ENABLE} < 0.25V$	I_S		3.6	4.6	mA
	Power up, $V_S = 3.0$, $V_{ENABLE} > 1.7V$, $V_{PA_ENABLE} > 1.7V$	$I_{S_Transmit}$		8.5	11	mA
Output power	$V_S = 3.0V$, $T_{amb} = 25^{\circ}C$, $f = 868.3\text{ MHz}$, $Z_{Load} = (166 + j226)\Omega$	P_{Ref}	3.5	5.5	8	dBm
Output power variation for the full temperature range	$T_{amb} = -40^{\circ}C$ to $+85^{\circ}C$, $V_S = 3.0V$ $V_S = 2.0V$	ΔP_{Ref} ΔP_{Ref}			–1.5 –4.0	dB dB
Output power variation for the full temperature range	$T_{amb} = -40^{\circ}C$ to $+125^{\circ}C$, $V_S = 3.0V$ $V_S = 2.0V$, $P_{Out} = P_{Ref} + \Delta P_{Ref}$	ΔP_{Ref} ΔP_{Ref}			–2.0 –4.5	dB dB
Achievable output-power range	Selectable by load impedance	P_{Out_typ}	–3		+5.5	dBm

Note: 1. If V_S is higher than 3.6V, the maximum voltage will be reduced to 3.6V.

7. Electrical Characteristics (Continued)

$V_S = 2.0V$ to $4.0V$, $T_{amb} = -40^{\circ}C$ to $125^{\circ}C$ unless otherwise specified.

Typical values are given at $V_S = 3.0V$ and $T_{amb} = 25^{\circ}C$. All parameters are referred to GND (pin 7).

Parameters	Test Conditions	Symbol	Min.	Typ.	Max.	Unit
Spurious emission	$f_{CLK} = f_0/128$ Load capacitance at pin CLK = 10pF $f_0 \pm 1 \times f_{CLK}$ $f_0 \pm 4 \times f_{CLK}$ other spurious are lower			-52 -52		dBc dBc
Oscillator frequency XTO (= phase comparator frequency)	$f_{XTO} = f_0/64$ f_{XTAL} = resonant frequency of the XTAL, $C_M \leq 10fF$, load capacitance selected accordingly $T_{amb} = -40^{\circ}C$ to $+85^{\circ}C$, $T_{amb} = -40^{\circ}C$ to $+125^{\circ}C$	f_{XTO}	-30 -40	f_{XTAL}	+30 +40	ppm ppm
PLL loop bandwidth				250		kHz
Phase noise of phase comparator	Referred to $f_{PC} = f_{XTO}$, 25kHz distance to carrier			-116	-110	dBc/Hz
In loop phase noise PLL	25kHz distance to carrier			-80	-74	dBc/Hz
Phase noise VCO	at 1MHz at 36MHz			-89 -120	-86 -117	dBc/Hz dBc/Hz
Frequency range of VCO		f_{VCO}	868		928	MHz
Clock output frequency (CMOS microcontroller compatible)				$f_0/256$		MHz
Voltage swing at pin CLK	$C_{Load} \leq 10pF$	V_{OH} V_{OL}	$V_S \times 0.8$		$V_S \times 0.2$	V V
Series resonance R of the crystal		Rs			110	Ω
Capacitive load at pin XTO					7	pF
FSK modulation frequency rate	Duty cycle of the modulation signal = 50%		0		32	kHz
ASK modulation frequency rate	Duty cycle of the modulation signal = 50%		0		32	kHz
ENABLE input	Low level input voltage High level input voltage Input current high	V_{IL} V_{IH} I_{IN}	1.7		0.25 20	V V μA
PA_ENABLE input	Low level input voltage High level input voltage Input current high	V_{IL} V_{IH} I_{IN}	1.7		0.25 $V_S^{(1)}$ 5	V V μA

Note: 1. If V_S is higher than 3.6V, the maximum voltage will be reduced to 3.6V.
