# 1 Description

The M87C257 is a 256 Kbit EPROM offered in the two ranges UV (ultra violet erase) and OTP (one time programmable). It incorporates latches for all address inputs to minimize chip count, reduce cost, and simplify the design of multiplexed bus systems and is organized as 32,768 by 8 bits.

The FDIP28W (window ceramic frit-seal package) has a transparent lid which allows the user to expose the chip to ultraviolet light to erase the bit pattern. A new pattern can then be written to the device by following the programming procedure.

For applications where the content is programmed only one time and erasure is not required, the M87C257 is offered in PLCC32 package.

In order to meet environmental requirements, ST offers the M87C257 in ECOPACK® packages.

ECOPACK packages are Lead-free. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label.

ECOPACK is an ST trademark. ECOPACK specifications are available at: *www.st.com*.

# 2 Device operation

The modes of operation of the M87C257 are listed in the Operating Modes. A single power supply is required in the read mode. All inputs are TTL levels except for $V_{PP}$ and 12V on A9 for Electronic Signature.

## 2.1 Read mode

The M87C257 has two control functions, both of which must be logically active in order to obtain data at the outputs. Chip Enable ($\overline{E}$) is the power control and should be used for device selection. Output Enable ($\overline{G}$) is the output control and should be used to gate data to the output pins, independent of device selection. Assuming that the addresses are stable ($\overline{AS}$ = $V_{IH}$) or latched ($\overline{AS}$ = $V_{IL}$), the address access time ($t_{AVQV}$) is equal to the delay from $\overline{E}$ to output ($t_{ELQV}$). Data is available at the output after delay of $t_{GLQV}$ from the falling edge of $\overline{G}$, assuming that $\overline{E}$ has been low and the addresses have been stable for at least $t_{AVQV}$-$t_{GLQV}$.The M87C257 reduces the hardware interface in multiplexed address-data bus systems. The processor multiplexed bus (AD0-AD7) may be tied to the M87C257's address and data pins. No separate address latch is needed because the M87C257 latches all address inputs when $\overline{AS}$ is low.

## 2.2 Standby mode

The M87C257 has a standby mode which reduces the active current from 30mA to 100µA (Address Stable). The M87C257 is placed in the standby mode by applying a CMOS high signal to the $\overline{E}$ input. When in the standby mode, the outputs are in a high impedance state, independent of the $\overline{G}$ input.

## 2.3 Two Line Output Control

Because EPROMs are usually used in larger memory arrays, this product features a 2 line control function which accommodates the use of multiple memory connection. The two line control function allows:

- the lowest possible memory power dissipation,
- complete assurance that output bus contention will not occur.

For the most efficient use of these two control lines, $\overline{E}$ should be decoded and used as the primary device selecting function, while $\overline{G}$ should be made a common connection to all devices in the array and connected to the $\overline{READ}$ line from the system control bus. This ensures that all deselected memory devices are in their low power standby mode and that the output pins are only active when data is desired from a particular memory device.

## 2.4 System considerations

The power switching characteristics of Advance CMOS EPROMs require careful decoupling of the devices. The supply current, $I_{CC}$, has three segments that are of interest to the system designer: the standby current level, the active current level, and transient current peaks that are produced by the falling and rising edges of $\overline{E}$. The magnitude of this transient current peaks is dependent on the capacitive and inductive loading of the device at the output. The associated transient voltage peaks can be suppressed by complying with the two line output control and by properly selected decoupling capacitors. It is recommended that a 0.1µF ceramic capacitor be used on every device between $V_{CC}$ and $V_{SS}$. This should be a high frequency capacitor of low inherent inductance and should be placed as close to the device as possible. In addition, a 4.7µF bulk electrolytic capacitor should be used between $V_{CC}$ and $V_{SS}$ for every eight devices. The bulk capacitor should be located near the power supply connection point. The purpose of the bulk capacitor is to overcome the voltage drop caused by the inductive effects of PCB traces.

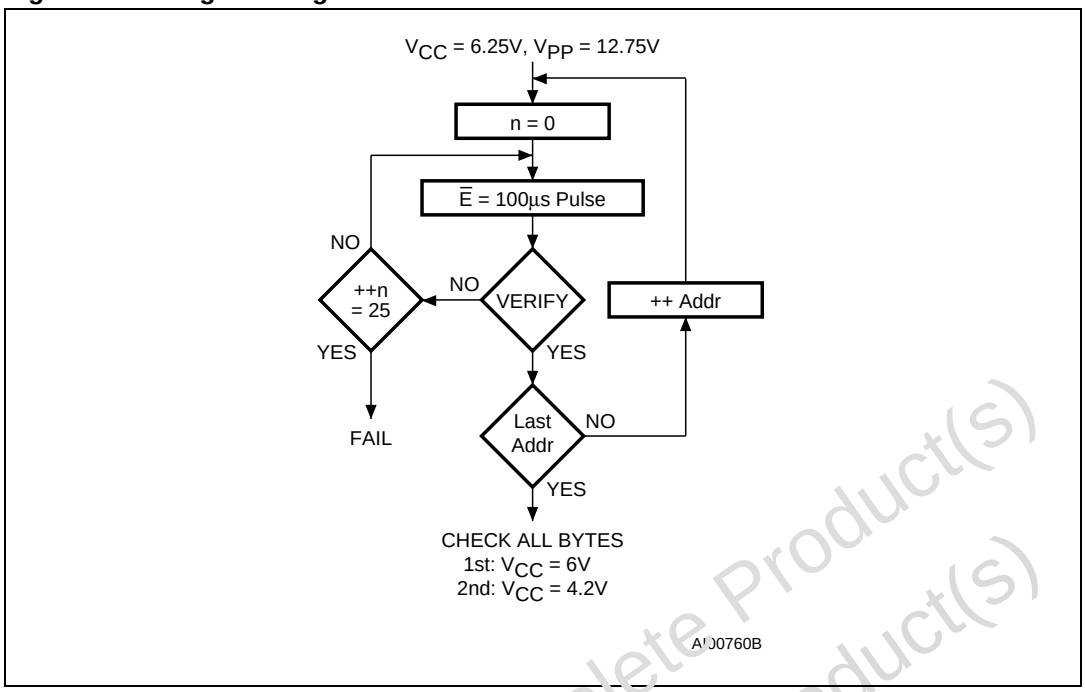
## 2.5 Programming

When delivered (and after each erasure for UV EPROM), all bits of the M87C257 are in the '1' state. Data is introduced by selectively programming '0's into the desired bit locations. Although only '0's will be programmed, both '1's and '0's can be present in the data word. The only way to change a '0' to a '1' is by die exposition to ultraviolet light (UV EPROM). The M87C257 is in the programming mode when $V_{PP}$ input is at 12.75V, $\overline{G}$ is at $V_{IH}$ and $\overline{E}$ is pulsed to $V_{IL}$. The data to be programmed is applied to 8 bits in parallel to the data output pins. The levels required for the address and data inputs are TTL. $V_{CC}$ is specified to be 6.25 V ± 0.25 V.

## 2.6 PRESTO II programming algorithm

PRESTO II Programming Algorithm allows to program the whole array with a guaranteed margin, in a typical time of 3.5 seconds. Programming with PRESTO II involves the application of a sequence of 100µs program pulses to each byte until a correct verify occurs (see *Figure 4*). During programming and verify operation, a MARGIN MODE circuit is automatically activated in order to guarantee that each cell is programmed with enough margin. No overprogram pulse is applied since the verify in MARGIN MODE provides necessary margin to each programmed cell.

**Figure 4. Programming flowchart**



## 2.7 Program Inhibit

Programming of multiple M87C257s in parallel with different data is also easily accomplished. Except for $\overline{E}$, all like inputs including $\overline{G}$ of the parallel M87C257 may be common. A TTL low level pulse applied to a M87C257's $\overline{E}$ input, with $V_{PP}$ at 12.75V, will program that M87C257. A high level $\overline{E}$ input inhibits the other M87C257s from being programmed.

## 2.8 Program Verify

A verify (read) should be performed on the programmed bits to determine that they were correctly programmed. The verify is accomplished with $\overline{G}$ at $V_{IL}$, $\overline{E}$ at $V_{IH}$, $V_{PP}$ at 12.75V and $V_{CC}$ at 6.25V.

## 2.9 Electronic signature

The Electronic Signature (ES) mode allows the reading out of a binary code from an EPROM that will identify its manufacturer and type. This mode is intended for use by programming equipment to automatically match the device to be programmed with its corresponding programming algorithm. The ES mode is functional in the 25°C ± 5°C ambient temperature range that is required when programming the M87C257.

To activate the ES mode, the programming equipment must force 11.5V to 12.5V on address line A9 of the M87C257, with $V_{CC} = V_{PP} = 5V$. Two identifier bytes may then be sequenced from the device outputs by toggling address line A0 from $V_{IL}$ to $V_{IH}$. All other address lines must be held at $V_{IL}$ during Electronic Signature mode. Byte 0 (A0 = $V_{IL}$) represents the manufacturer code and byte 1 (A0 = $V_{IH}$) the device identifier code. When A9 = $V_{ID}$, $\overline{AS}$ need not be toggled to latch each identifier address. For the STMicroelectronics M87C257, these two identifier bytes are given in *Table 4* and can be read-out on outputs Q7 to Q0.

## 2.10 Erasure operation (applies for UV EPROM)

The erasure characteristics of the M87C257 is such that erasure begins when the cells are exposed to light with wavelengths shorter than approximately 4000 Å. It should be noted that sunlight and some type of fluorescent lamps have wavelengths in the 3000-4000 Å range. Research shows that constant exposure to room level fluorescent lighting could erase a typical M87C257 in about 3 years, while it would take approximately 1 week to cause erasure when exposed to direct sunlight. If the M87C257 is to be exposed to these types of lighting conditions for extended periods of time, it is suggested that opaque labels be put over the M87C257 window to prevent unintentional erasure. The recommended erasure procedure for the M87C257 is exposure to short wave ultraviolet light which has wavelength 2537Å. The integrated dose (i.e. UV intensity x exposure time) for erasure should be a minimum of 15 W-sec/cm$^2$. The erasure time with this dosage is approximately 15 to 20 minutes using an ultraviolet lamp with 12000 µW/cm$^2$ power rating. The M87C257 should be placed within 2.5 cm (1 inch) of the lamp tubes during the erasure. Some lamps have a filter on their tubes which should be removed before erasure.

# 3 Maximum rating

Stressing the device above the rating listed in the Absolute Maximum Ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

**Table 2. Absolute maximum ratings**

| Symbol | Parameter | Value | Unit |
|---|---|---|---|
| $T_A$ | Ambient Operating Temperature(1) | –40 to 125 | °C |
| $T_{BIAS}$ | Temperature Under Bias | –50 to 125 | °C |
| $T_{STG}$ | Storage Temperature | –65 to 150 | °C |
| $V_{IO}$(2) | Input or Output Voltage (except A9) | –2 to 7 | V |
| $V_{CC}$ | Supply Voltage | –2 to 7 | V |
| $V_{A9}$(2) | A9 Voltage | –2 to 13.5 | V |
| $V_{PP}$ | Program Supply Voltage | –2 to 14 | V |

1. Depends on range.
2. Minimum DC voltage on Input or Output is –0.5V with possible undershoot to –2.0V for a period less than 20ns. Maximum DC voltage on Output is $V_{CC}$ +0.5V with possible overshoot to $V_{CC}$ +2V for a period less than 20ns.

**Table 3. Operating modes**

| Mode | $\overline{E}$ | $\overline{G}$ | A9 | $\overline{ASV}_{PP}$ | Q7-Q0 |
|---|---|---|---|---|---|
| Read (Latched Address) | $V_{IL}$ | $V_{IL}$ | X | $V_{IL}$ | Data Out |
| Read (Applied Address) | $V_{IL}$ | $V_{IL}$ | X | $V_{IH}$ | Data Out |
| Output Disable | $V_{IL}$ | $V_{IH}$ | X | X | Hi-Z |
| Program | $V_{IL}$ Pulse | $V_{IH}$ | X | $V_{PP}$ | Data In |
| Verify | $V_{IH}$ | $V_{IL}$ | X | $V_{PP}$ | Data Out |
| Program Inhibit | $V_{IH}$ | $V_{IH}$ | X | $V_{PP}$ | Hi-Z |
| Standby | $V_{IH}$ | X | X | X | Hi-Z |
| Electronic Signature | $V_{IL}$ | $V_{IL}$ | $V_{ID}$ | $V_{IL}$ | Codes |

1. X = $V_{IH}$ or $V_{IL}$, $V_{ID}$ = 12V ± 0.5V.

**Table 4. Electronic signature**

| Identifier | A0 | Q7 | Q6 | Q5 | Q4 | Q3 | Q2 | Q1 | Q0 | Hex Data |
|---|---|---|---|---|---|---|---|---|---|---|
| Manufacturer's Code | $V_{IL}$ | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 20h |
| Device Code | $V_{IH}$ | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 80h |

# 4 DC and AC parameters

This section summarizes the operating and measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC Characteristic tables that follow are derived from tests performed under the Measurement Conditions summarized in the relevant tables. Designers should check that the operating conditions in their circuit match the measurement conditions when relying on the quoted parameters.

**Table 5. AC measurement conditions**

| | High Speed | Standard |
|---|---|---|
| Input Rise and Fall Times | ≤10ns | ≤20ns |
| Input Pulse Voltages | 0 to 3V | 0.4V to 2.4V |
| Input and Output Timing Ref. Voltages | 1.5V | 0.8V and 2V |

**Figure 5. AC testing input output waveform**

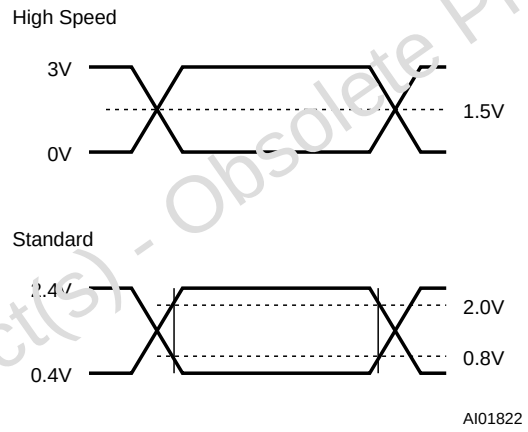


**Figure 6. AC testing load circuit**

# 6 Part numbering

**Table 14. Ordering information scheme**

Example: M87C257 -70 X C 1 X

**Device Type**
M87

**Supply Voltage**
C = 5V

**Device Function**
257 = 256 Kbit (32Kb x 8)

**Speed**
-45(1) = 45 ns
-60 = 60ns
-70 = 70 ns
-80 = 80 ns
-90 = 90 ns
-10 = 100 ns
-12 = 120 ns
-15 = 150 ns
-20 = 200 ns

**$V_{CC}$ Tolerance**
X = ± 5%
blank = ± 10%

**Package**
F = FDIP28W
C = PLCC32

**Temperature Range**
1 = 0 to 70 °C
3 = –40 to 125 °C
6 = –40 to 85 °C

**Options**
TR = Tape & Reel Packing

1. High Speed, see AC Characteristics section for further information.

For a list of available options (Speed, Package, etc...) or for further information on any aspect of this device, please contact the STMicroelectronics Sales Office nearest to you.

# 7 Revision history

**Table 15. Document revision history**

| Date | Revision | Changes |
|---|---|---|
| 01-Jun-1996 | 1 | Initial release. |
| 23-May-2006 | 2 | Document converted to new template (sections added, information moved).<br>Packages are ECOPACK® compliant. Package specifications updated (see *Section 5: Package mechanical*).<br>X option removed from *Table 15: Document revision history*. |

**Please Read Carefully:**

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries (“ST”) reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST’s terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

**UNLESS OTHERWISE SET FORTH IN ST’S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.**

**UNLESS EXPRESSLY APPROVED IN WRITING BY AN AUTHORIZE REPRESENTATIVE OF ST, ST PRODUCTS ARE NOT DESIGNED, AUTHORIZED OR WARRANTED FOR USE IN MILITARY, AIR CRAFT, SPACE, LIFE SAVING, OR LIFE SUSTAINING APPLICATIONS, NOR IN PRODUCTS OR SYSTEMS, WHERE FAILURE OR MALFUNCTION MAY RESULT IN PERSONAL INJURY, DEATH, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE.**

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.

ST and the ST logo are trademarks or registered trademarks of ST in various countries.

Information in this document supersedes and replaces all information previously supplied.

The ST logo is a registered trademark of STMicroelectronics. All other names are the property of their respective owners.
