- Access path via dedicated AXBS slave port
  - Avoids contention with other memory accesses
- Two Dual-channel FlexRay controllers
- Nexus development interface (NDI) per IEEE-ISTO 5001-2003 standard, with some support for 2010 standard
- Device and board test support per Joint Test Action Group (JTAG) (IEEE 1149.1)
- Self-test capability

# 1 Introduction

## 1.1 Document overview

This document provides electrical specifications, pin assignments, and package diagrams for the MPC5777M series of microcontroller units (MCUs). For functional characteristics, see the *MPC5777M Microcontroller Reference Manual*.

## 1.2 Description

This family of MCUs is targeted at automotive powertrain controller and chassis control applications from single cylinder motorcycles at the very bottom end; through 4 to 8 cylinder gasoline and diesel engines; transmission control; steering and breaking applications; to high end hybrid and advanced combustion systems at the top end.

Many of the applications are considered to be functionally safe and the family is designed to achieve ISO26262 ASIL-D compliance.

## 1.3 Device feature

**Table 1. MPC5777M feature**

Feature		MPC5777M
Process		55 nm
Main processor	Core	e200z7
	Number of main cores	2
	Number of checker cores	1
	Local RAM (per main core)	16 KB Instruction 64 KB Data
	Single precision floating point	Yes
	LSP	No
	VLE	Yes
	Cache	16 KB Instruction 4 KB Data
I/O processor	Core	e200z4
	Local RAM	16 KB instruction 64 KB Data
	Single precision floating point	Yes
	LSP	Yes
	VLE	Yes
	Cache	8 KB instruction
Main processor frequency		300 MHz <sup>1</sup>
I/O processor frequency		200 MHz
MMU entries		0
MPU		Yes
Semaphores		Yes

Table 1. MPC5777M feature (continued)

Feature	MPC5777M
CRC channels	2
Software watchdog timer (Task SWT/Safety SWT)	4 (3/1)
Core Nexus class	3+
Sequence processing unit (SPU)	Yes
Debug and calibration interface (DCI) / run control module	Yes
System SRAM	404 KB
Flash memory	8640 KB
Flash memory fetch accelerator	4 × 256 bit
Data flash memory (EEPROM)	8 × 64 KB + 2 × 16 KB
Flash memory overlay RAM	16 KB
External bus	32 bit
Calibration interface	64-bit IPS Slave
DMA channels	2 × 64
DMA Nexus Class	3+
LINFlex (UART/MSC)	6 (3/3)
MCAN/TTCAN	4/1
DSPI (SPI/MSC/sync SCI)	8 (4/3/1)
Microsecond bus downlink	Yes
SENT bus	15
I <sup>2</sup> C	2
PSI5 bus	5
PSI5-S UART-to-PSI5 interface	Yes
FlexRay	2 × dual channel
Ethernet	MII / RMII
Zipwire <sup>®</sup> (SIPI / LFAST <sup>2</sup> ) Interprocessor Communication Interface	High speed
System timers	8 PIT channels 3 AUTOSAR <sup>®</sup> (STM) 64-bit PIT
BOSCH <sup>®</sup> GTM Timer <sup>3</sup>	Yes
GTM RAM	58 KB
Interrupt controller	727 sources
ADC (SAR)	12

Table 1. MPC5777M feature (continued)

Feature	MPC5777M
ADC (SD)	10
Temperature sensor	Yes
Self test controller	Yes
PLL	Dual PLL with FM
Integrated linear voltage regulator	None
External power supplies	5 V 3.3 V <sup>7</sup> 1.2 V
Low-power modes	Stop mode Slow mode
Packages	<ul style="list-style-type: none"> <li>• 416 TEPBGA<sup>4</sup></li> <li>• 512 TEPBGA<sup>5</sup></li> </ul>

<sup>1</sup> Includes four user-programmable CPU cores and one safety core. The main computational shell consists of dual e200z7 CPUs operating at 300 MHz with a third identical core running as a safety checker core in delayed lockstep mode with one of the dual e200z7 cores. The I/O subsystem includes a CPU targeted at managing the peripherals. This is an e200z4 CPU running at 200 MHz. The fifth CPU is an e200z0 running at 100 MHz and is embedded in the Hardware Security Module. All CPUs are compatible with the Power Architecture.

<sup>2</sup> LVDS Fast Asynchronous Serial Transmission

<sup>3</sup> BOSCH® is a registered trademark of Robert Bosch GmbH.

<sup>4</sup> 416 TEPBGA package supports development and production applications with the same package footprint.

<sup>5</sup> 512 TEPBGA package supports development and production applications with the same package footprint.

## 1.4 Block diagram

The figures below show the top-level block diagrams.

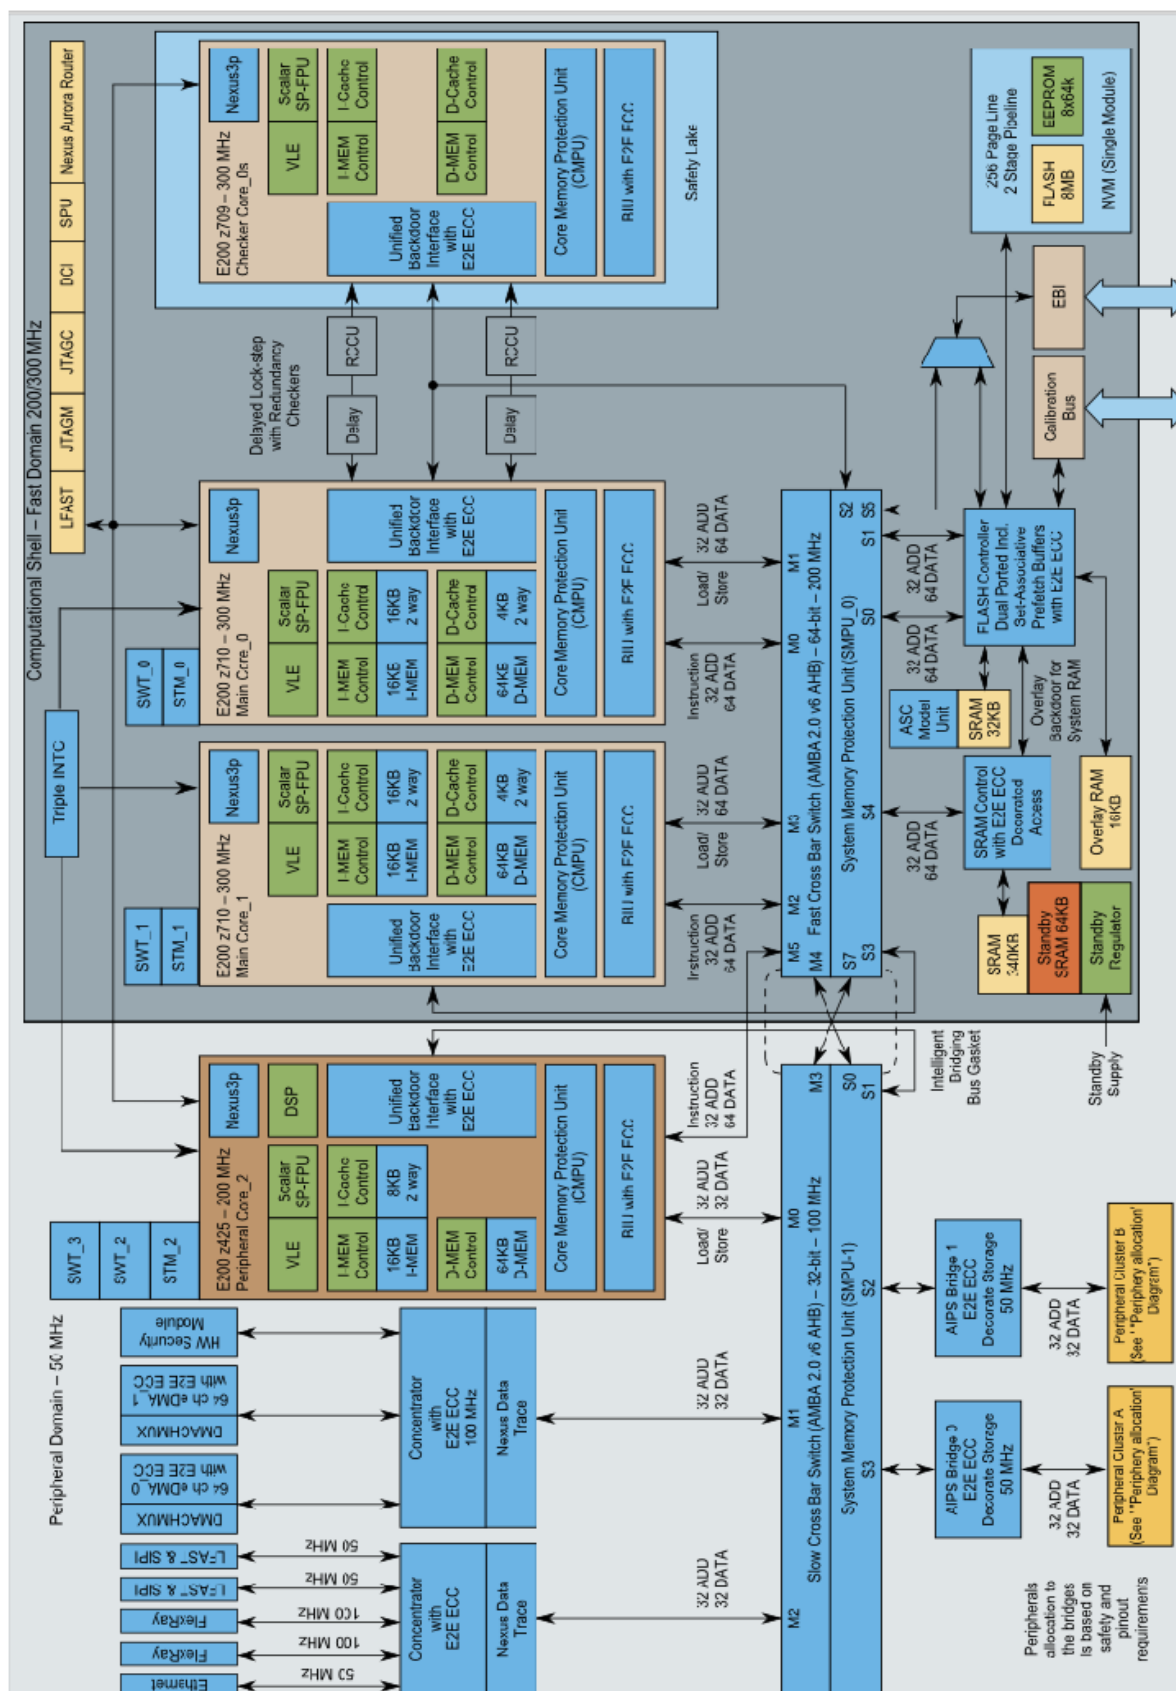

Figure 1. Block diagram

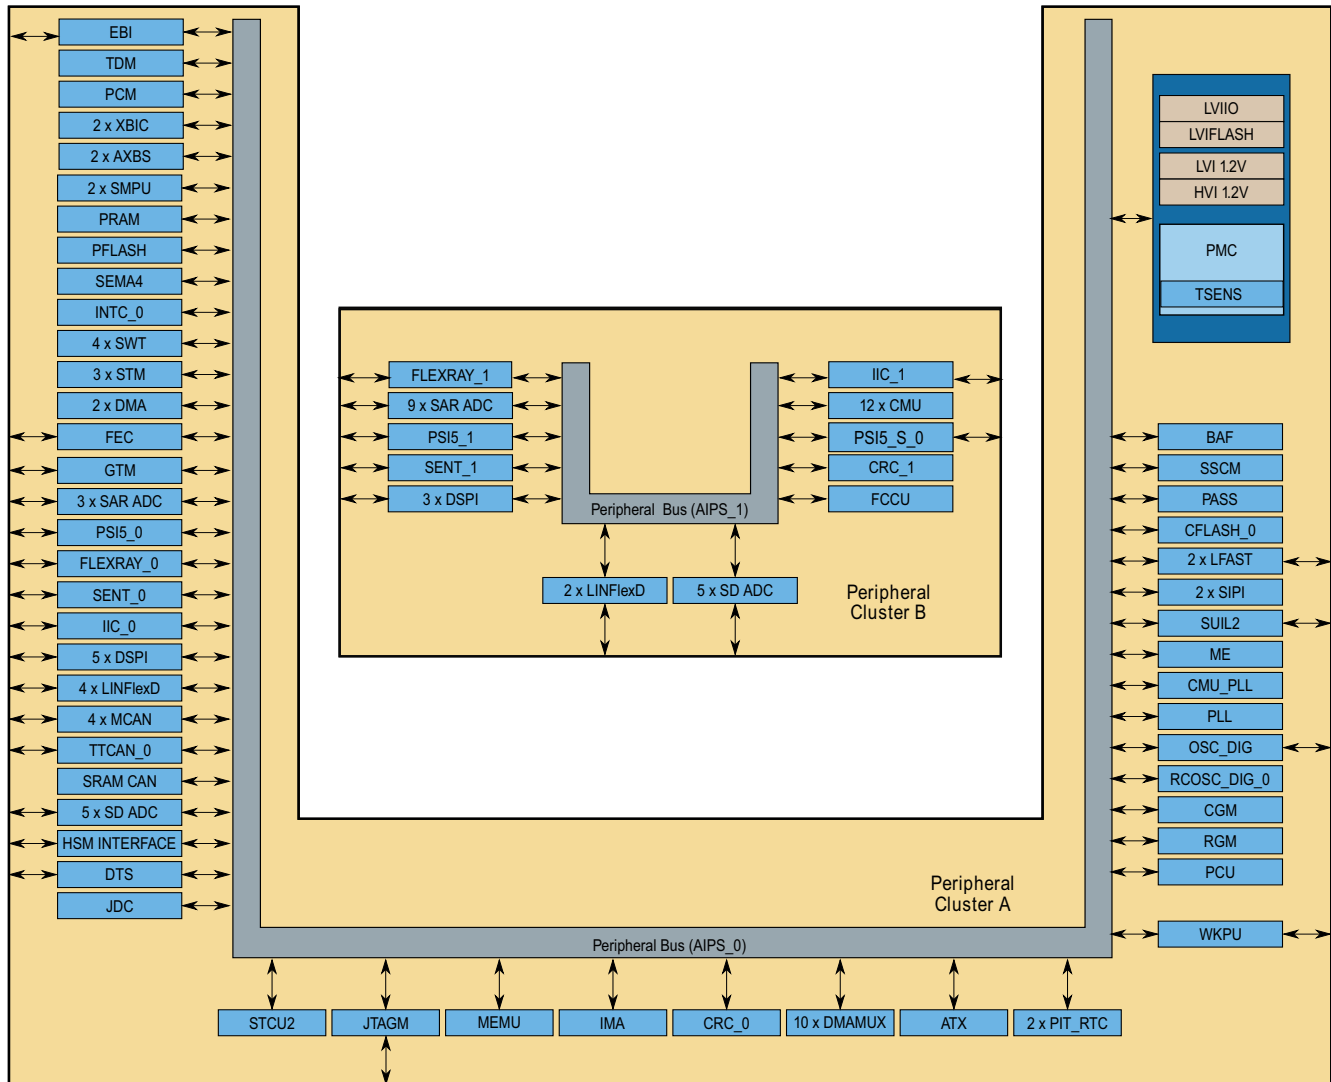

Figure 2. Peripheral allocation

## 2 Package pinouts and signal descriptions

See the *MPC5777M Microcontroller Reference Manual* for signal information.

## 2.1 Package pinouts

The BGA ballmap package pinouts for the 416 and 512 production and emulation devices are shown in the following figures.

## 2.2 Pin/ball descriptions

The following sections provide signal descriptions and related information about device functionality and configuration.

### 2.2.1 Power supply and reference voltage pins/balls

Table 2 contains information on power supply and reference pin functions for the devices.

#### NOTE

All ground supplies must be tied to ground. They can NOT float.

**Table 2. Power supply and reference pins**

Supply			BGA ball			
Symbol	Type	Description	416PD	416ED	512PD	512ED
V <sub>SS_HV</sub>	Ground	High voltage ground	A26, B25, C24, D23, D15, D8, J4, L23, R23, T4, W23, AC23, AC19		B2, B29, B30, F6, F25, G7, G24, H29, H30, J9, J22, K10, K21, V29, AA21, AB22, AD24, AE25, AJ10, AJ29, AK10	
V <sub>SS_LV</sub>	Ground	Low voltage ground	K10, K11, K12, K13, K14, K15, K16, K17, L10, L11, L12, L13, L14, L15, L16, L17, M10, M11, M12, M13, M14, M15, M16, M17, N10, N11, N12, N13, N14, N15, N16, N17, P11, P12, P13, P14, P15, P16, R11, R12, R13, R14, R15, R16, T10, T11, T12, T13, T14, T15, T16, T17		M14, M15, M16, M17, N14, N15, N16, N17, P12, P13, P15, P16, P18, P19, R13, R14, R15, R16, R17, R18, T13, T14, T15, T16, T17, T18, U12, U13, U15, U16, U18, U19, V14, V15, V16, V17, W14, W17	
V <sub>DD_LV</sub>	Power	Low voltage power supply for production device (PLL is also powered by this pin.)	B26, C25, D9, D24, E23, H4, P23, V23, AB23, AC20		M18, N19, V12, V19, W13, W18	
V <sub>DD_LV_BD</sub>	Power	Low voltage power supply for buddy die	—	R1, R4	—	M13, N12
V <sub>DD_HV_PMC</sub>	Power	High voltage power supply for internal power management unit	D14		—	
V <sub>DD_HV_IO_MAIN</sub>	Power	High voltage power supply for I/O	A25, B24, C23, D22, K4, AC16, AD16, AE16, AF16		A2, A29, B3, B28, F7, F24, G8, G23, AC24, AD25, AH29, AJ30	
V <sub>DD_HV_IO_BD</sub>	Power	High voltage power supply for buddy die I/O	—	P17	—	R19
V <sub>SS_HV_OSC</sub>	Ground	Oscillator ground supply	F25		T25	
V <sub>DD_HV_JTAG</sub>	Power	JTAG/Oscillator power supply	E26		V25	

Table 2. Power supply and reference pins (continued)

Supply			BGA ball			
Symbol	Type	Description	416PD	416ED	512PD	512ED
V <sub>DD_HV_IO_FLEX</sub>	Power	FlexRay/Ethernet 3.3 V I/O supply	D7		J10	
V <sub>DD_HV_IO_FLEXE</sub>	Power	FLexRay/Ethernet/EBI I/O Segment Voltage Supply	AC18, AC22		AJ11, AK11, AK20, AK29	
V <sub>DD_HV_IO_EBI</sub>	Power	EBI Address/Control I/O Segment Voltage Supply	M23, T23, Y23		J29, J30, V30, AH30	
V <sub>DD_HV_FL A</sub>	Power	Decoupling supply pin for flash	A18, B18		J21, K20	
V <sub>SS_HV_ADV_S</sub>	Ground	Ground supply for ADC SAR	AF9		AE9, AJ8	
V <sub>DD_HV_ADV_S</sub>	Power	Voltage supply for ADC SAR	AE9		AE10, AJ9	
V <sub>SS_HV_ADV_D</sub>	Ground	Ground supply for ADC SD	AF5		AK8	
V <sub>DD_HV_ADV_D</sub>	Power	Voltage supply for ADC SD	AE5		AK9	
V <sub>SS_HV_ADR_S</sub>	Reference	Ground reference for ADC SAR	AE8		AE12	
V <sub>DD_HV_ADR_S</sub>	Reference	Voltage reference for ADC SAR	AF8		AE11	
V <sub>SS_HV_ADR_D</sub>	Reference	Ground reference for ADC SD	Y4, AC6		AA7	
V <sub>DD_HV_ADR_D</sub>	Reference	Voltage reference for ADC SD	W4, AD6		AA6	
V <sub>DDSTBY</sub>	Power	Standby RAM supply	AD9		AA16	

## 2.2.2 System pins/balls

Table 3 contains information on system pin functions for the devices.

Table 3. System pins

Symbol	Description	Direction	BGA ball			
			416PD	416ED	512PD	512ED
PORST	Power on reset with Schmitt trigger characteristics and noise filter. PORST is active low	Bidirectional	B22		M22	
ESR0	External functional reset with Schmitt trigger characteristics and noise filter. ESR0 is active low	Bidirectional	A23		L21	
TESTMODE	Pin for testing purpose only. TESTMODE pull-down is implemented to prevent the device from entering TESTMODE. It is recommended to connect the TESTMODE pin to V <sub>SS_HV_IO</sub> on the board. The value of the TESTMODE pin is latched at the negation of reset and has no affect afterward. <b>Note:</b> The device will not exit reset with the TESTMODE pin asserted during power-up.	Input only	B23		N24	

Table 3. System pins (continued)

Symbol	Description	Direction	BGA ball			
			416PD	416ED	512PD	512ED
XTAL	Analog output of the oscillator amplifier circuit needs to be grounded if oscillator is used in bypass mode.	Output	G25		U24	
EXTAL	Analog input of the oscillator amplifier circuit when oscillator is not in bypass mode Analog input for the clock generator when oscillator is in bypass mode	Input	G26		U25	

## 2.2.3 LVDS pins/balls

The following table contains information on LVDS pin functions for the devices.

Table 4. LVDS pin descriptions

Functional block	Port pin	Signal	Signal description	Direction	BGA ball (416 PD, 416 ED)	BGA ball (512 PD, 512 ED)
SIPI / LFAST <sup>1</sup>	PA[14]	SIPI_TXP	Interprocessor Bus LFAST, LVDS Transmit Positive Terminal	O	C26	P25
	PD[6]	SIPI_TXN	Interprocessor Bus LFAST, LVDS Transmit Negative Terminal	O	D26	R25
	PD[7]	SIPI_RXP	Interprocessor Bus LFAST, LVDS Receive Positive Terminal	I	G23	P24
	PF[13]	SIPI_RXN	Interprocessor Bus LFAST, LVDS Receive Negative Terminal	I	H23	R24
High-Speed Debug (HSD) / LFAST <sup>1,2</sup>	PA[7]	DEBUG_TXP	Debug LFAST, LVDS Transmit Positive Terminal	O	F24	R21
	PA[8]	DEBUG_TXN	Debug LFAST, LVDS Transmit Negative Terminal	O	E25	N22
	PA[9]	DEBUG_RXP	Debug LFAST, LVDS Receive Positive Terminal	I	D25	N21
	PA[5]	DEBUG_RXN	Debug LFAST, LVDS Receive Negative Terminal	I	F23	T24

Table 4. LVDS pin descriptions (continued)

Functional block	Port pin	Signal	Signal description	Direction	BGA ball (416 PD, 416 ED)	BGA ball (512 PD, 512 ED)
DSPI 4 Microsecond Bus	PD[2]	SCK_P	DSPI 4 Microsecond Bus Serial Clock, LVDS Positive Terminal	O	C18	F17
	PD[3]	SCK_N	DSPI 4 Microsecond Bus Serial Clock, LVDS Negative Terminal	O	C17	G17
	PD[0]	SOUT_P	DSPI 4 Microsecond Bus Serial Data, LVDS Positive Terminal	O	C16	F16
	PD[1]	SOUT_N	DSPI 4 Microsecond Bus Serial Data, LVDS Negative Terminal	O	D17	G16
DSPI 5 Microsecond Bus	PF[10]	SCK_P	DSPI 5 Microsecond Bus Serial Clock, LVDS Positive Terminal	O	J24	W24
	PF[9]	SCK_N	DSPI 5 Microsecond Bus Serial Clock, LVDS Negative Terminal	O	K23	W25
	PF[12]	SOUT_P	DSPI 5 Microsecond Bus Serial Data, LVDS Positive Terminal	O	J26	Y24
	PF[11]	SOUT_N	DSPI 5 Microsecond Bus Serial Data, LVDS Negative Terminal	O	J25	Y25
DSPI 6 Microsecond Bus	PQ[9]	SCK_P	DSPI 6 Microsecond Bus Serial Clock, LVDS Positive Terminal	O	A17	A16
	PQ[8]	SCK_N	DSPI 6 Microsecond Bus Serial Clock, LVDS Negative Terminal	O	B17	B16
	PQ[11]	SOUT_P	DSPI 6 Microsecond Bus Serial Data, LVDS Positive Terminal	O	B16	A15
	PQ[10]	SOUT_N	DSPI 6 Microsecond Bus Serial Data, LVDS Negative Terminal	O	A16	B15

Table 4. LVDS pin descriptions (continued)

Functional block	Port pin	Signal	Signal description	Direction	BGA ball (416 PD, 416 ED)	BGA ball (512 PD, 512 ED)
Differential DSPI 2	PD[2]	SCK_P	Differential DSPI 2 Clock, LVDS Positive Terminal	O	C18	F17
	PD[3]	SCK_N	Differential DSPI 2 Clock, LVDS Negative Terminal	O	C17	G17
	PD[0]	SOUT_P	Differential DSPI 2 Serial Output, LVDS Positive Terminal	O	C16	F16
	PD[1]	SOUT_N	Differential DSPI 2 Serial Output, LVDS Negative Terminal	O	D17	G16
	PD[7]	SIN_P	Differential DSPI 2 Serial Input, LVDS Positive Terminal	I	G23	P24
	PF[13]	SIN_N	Differential DSPI 2 Serial Input, LVDS Negative Terminal	I	H23	R24
Differential DSPI 5	PF[10]	SCK_P	Differential DSPI 5 Clock, LVDS Positive Terminal	O	J24	W24
	PF[9]	SCK_N	Differential DSPI 5 Clock, LVDS Negative Terminal	O	K23	W25
	PF[12]	SOUT_P	Differential DSPI 5 Serial Output, LVDS Positive Terminal	O	J26	Y24
	PF[11]	SOUT_N	Differential DSPI 5 Serial Output, LVDS Negative Terminal	O	J25	Y25
	PD[7]	SIN_P	Differential DSPI 5 Serial Input, LVDS Positive Terminal	I	G23	P24
	PF[13]	SIN_N	Differential DSPI 5 Serial Input, LVDS Negative Terminal	I	H23	R24
	PI[15]	SIN_P	Differential DSPI 5 Serial Input, LVDS Positive Terminal	I	G24	P22
	PI[14]	SIN_N	Differential DSPI 5 Serial Input, LVDS Negative Terminal	I	J23	R22

<sup>1</sup> DRCLK and TCK/DRCLK usage for SIPI LFAST and Debug LFAST are described in the *MPC5777M Microcontroller Reference Manual* SIPI LFAST and Debug LFAST chapters.

<sup>2</sup> Pads use special enable signal from DCI block: DCI driven enable for Debug LFAST pads is transparent to user.

Table 5. Aurora pin descriptions

Functional Block	PAD	Signal	Signal Description	Direction	BGA			
					416PD	416ED	512PD	512ED
Nexus Aurora High Speed Trace	—	TX0P	Nexus Aurora High Speed Trace Lane 0, LVDS Positive Terminal	O	—	U15	—	AB19
	—	TX0N	Nexus Aurora High Speed Trace Lane 0, LVDS Negative Terminal	O	—	U14	—	AB18
	—	TX1P	Nexus Aurora High Speed Trace Lane 1, LVDS Positive Terminal	O	—	U13	—	AB17
	—	TX1N	Nexus Aurora High Speed Trace Lane 1, LVDS Negative Terminal	O	—	U12	—	AB16
	—	TX2P	Nexus Aurora High Speed Trace Lane 2, LVDS Positive Terminal	O	—	U11	—	W16
	—	TX2N	Nexus Aurora High Speed Trace Lane 2, LVDS Negative Terminal	O	—	U10	—	W15
	—	TX3P	Nexus Aurora High Speed Trace Lane 3, LVDS Positive Terminal	O	—	P10	—	R12

	—	CLKN (BD-AGB TCLKN)	Nexus Aurora High Speed Trace Clock, LVDS Negative Terminal	I	—	U16	—	AB20

## 3 Electrical characteristics

### 3.1 Introduction

This section contains detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications.

In the tables where the device logic provides signals with their respective timing characteristics, the symbol “CC” (Controller Characteristics) is included in the “Symbol” column.

In the tables where the external system must provide signals with their respective timing characteristics to the device, the symbol “SR” (System Requirement) is included in the “Symbol” column.

#### NOTE

Within this document,  $V_{DD\_HV\_IO}$  refers to supply pins  $V_{DD\_HV\_IO\_MAIN}$ ,  $V_{DD\_HV\_IO\_JTAG}$ ,  $V_{DD\_HV\_IO\_FLEX}$ ,  $V_{DD\_HV\_IO\_FLEXE}$ ,  $V_{DD\_HV\_IO\_EBI}$ , and  $V_{DD\_HV\_FLA}$ .  $V_{DD\_HV\_ADV}$  refers to ADC supply pins  $V_{DD\_HV\_ADV\_S}$  and  $V_{DD\_HV\_ADV\_D}$ .  $V_{DD\_HV\_ADR}$  refers to ADC reference pins  $V_{DD\_HV\_ADR\_S}$  and  $V_{DD\_HV\_ADR\_D}$ .  $V_{SS\_HV\_ADV}$  refers to ADC ground pins  $V_{SS\_HV\_ADV\_S}$  and  $V_{SS\_HV\_ADV\_D}$ .  $V_{SS\_HV\_ADR}$  refers to ADC reference pins  $V_{SS\_HV\_ADR\_S}$  and  $V_{SS\_HV\_ADR\_D}$ .

### 3.2 Absolute maximum ratings

Table 6 describes the maximum ratings of the device.

Table 6. Absolute maximum ratings<sup>1</sup>

Symbol		Parameter	Conditions	Value		Unit
				Min	Max	
Cycle	SR	Lifetime power cycles	—	—	1000 k	—
$V_{DD\_LV}$	SR	1.2 V core supply voltage <sup>2,3,4</sup>	—	−0.3	1.5	V
$V_{DD\_LV\_BD}$	SR	Emulation module voltage <sup>2,3,4</sup>	—	−0.3	1.5	V
$V_{DD\_HV\_IO}$	SR	I/O supply voltage <sup>5,6</sup>	—	−0.3	6.0	V
$V_{DD\_HV\_PMC}$	SR	Power Management Controller supply voltage <sup>5</sup>	—	−0.3	6.0	V
$V_{DD\_HV\_FLA}$	SR	Flash core voltage <sup>7</sup>	—	−0.3	4.5	V
$V_{DDSTBY}$	SR	RAM standby supply voltage <sup>5</sup>	—	−0.3	6.0	V
$V_{SS\_HV\_ADV}$ <sup>8</sup>	SR	SAR and S/D ADC ground voltage	Reference to $V_{SS\_HV}$	−0.3	0.3	V
$V_{DD\_HV\_ADV}$ <sup>9</sup>	SR	SAR and S/D ADC supply voltage	Reference to corresponding $V_{SS\_HV\_ADV}$	−0.3	6.0	V
$V_{SS\_HV\_ADR}$ <sup>10</sup>	SR	SAR and S/D ADC low reference	Reference to $V_{SS\_HV}$	−0.3	0.3	V
$V_{DD\_HV\_ADR}$ <sup>11</sup>	SR	SAR and S/D ADC high reference	Reference to corresponding $V_{SS\_HV\_ADR}$	−0.3	6.0	V
$V_{DD\_HV\_IO\_JTAG}$	SR	Crystal oscillator, FEC MDIO/MDC, LFAST, JTAG <sup>5</sup>	Reference to $V_{SS\_HV}$	−0.3	6.0	V

Table 6. Absolute maximum ratings<sup>1</sup> (continued)

Symbol	Parameter	Conditions	Value		Unit
			Min	Max	
$V_{DD\_HV\_IO\_EBI}$	SR External Bus Interface supply voltage	—	−0.3	6.0	V
$V_{DD\_LV\_BD} - V_{DD\_LV}$	SR Emulation module supply differential to 1.2 V core supply	—	−0.3	1.5	V
$V_{IN}$	SR I/O input voltage range <sup>12</sup>	—	−0.3	6.0	V
		Relative to $V_{SS\_HV\_IO}$ <sup>13,14</sup>	−0.3	—	
		Relative to $V_{DD\_HV\_IO}$ <sup>13,14</sup>	—	0.3	
$I_{INJD}$	SR Maximum DC injection current for digital pad	Per pin, applies to all digital pins	−5	5	mA
$I_{INJA}$	SR Maximum DC injection current for analog pad	Per pin, applies to all analog pins	−5	5	mA
$I_{MAXD}$	SR Maximum output DC current when driven	Medium	−7	8	mA
		Strong	−10	10	
		Very strong	−11	11	
$I_{MAXSEG}$	SR Maximum current per power segment <sup>15</sup>	—	−90	90	mA
$T_{STG}$	SR Storage temperature range and non-operating times	—	−55	175	°C
STORAGE	SR Maximum storage time, assembled part programmed in ECU	No supply; storage temperature in range −40 °C to 60 °C	—	20	years
$T_{SDR}$	SR Maximum solder temperature <sup>16</sup> Pb-free package	—	—	260	°C
MSL	SR Moisture sensitivity level <sup>17</sup>	—	—	3	—
$t_{XRAY}$	SR X-ray screen time <sup>18</sup>	At 160 KeV at max 5 mm	—	3	min

<sup>1</sup> Functional operating conditions are given in the DC electrical specifications. Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the listed maxima may affect device reliability or cause permanent damage to the device.

<sup>2</sup> Allowed 1.45 – 1.5 V for 60 seconds cumulative time at maximum  $T_J = 150$  °C, remaining time as defined in note 3 and note 4

<sup>3</sup> Allowed 1.38– 1.45 V– for 10 hours cumulative time at maximum  $T_J = 150$  °C, remaining time as defined in note 4

<sup>4</sup> 1.32 – 1.38 V range allowed periodically for supply with sinusoidal shape and average supply value below 1.326 V at maximum  $T_J = 150$  °C.

<sup>5</sup> Allowed 5.5–6.0 V for 60 seconds cumulative time with no restrictions, for 10 hours cumulative time device in reset,  $T_J = 150$  °C, remaining time at or below 5.5 V.

<sup>6</sup>  $V_{DD\_HV\_IO}$  applies to  $V_{DD\_HV\_IO\_MAIN}$ ,  $V_{DD\_HV\_IO\_FLEX}$ ,  $V_{DD\_HV\_IO\_FLEXE}$ ,  $V_{DD\_HV\_IO\_JTAG}$ , and  $V_{DD\_HV\_IO\_EBI}$  I/O power supplies.

<sup>7</sup> Allowed 3.6–4.5 V for 60 seconds cumulative time with no restrictions, for 10 hours cumulative time device in reset,  $T_J = 150$  °C, remaining time at or below 3.6 V.

<sup>8</sup> Includes ADC grounds  $V_{SS\_HV\_ADV\_S}$  and  $V_{SS\_HV\_ADV\_D}$ .

## Electrical characteristics

- <sup>9</sup> Includes ADC supplies  $V_{DD\_HV\_ADV\_S}$  and  $V_{DD\_HV\_ADV\_D}$ .  $V_{DD\_HV\_ADV\_S}$  is also the supply for the device temperature sensor, RCOSC, and bandgap reference.
- <sup>10</sup> Includes ADC low references  $V_{SS\_HV\_ADR\_S}$  and  $V_{SS\_HV\_ADR\_D}$ .
- <sup>11</sup> Includes ADC high references  $V_{DD\_HV\_ADR\_S}$  and  $V_{DD\_HV\_ADR\_D}$ .
- <sup>12</sup> The maximum input voltage on an I/O pin tracks with the associated I/O supply maximum. For the injection current condition on a pin, the voltage equals the supply plus the voltage drop across the internal ESD diode from I/O pin to supply. The diode voltage varies significantly across process and temperature, but a value of 0.3V can be used for nominal calculations.
- <sup>13</sup>  $V_{DD\_HV\_IO}/V_{SS\_HV\_IO}$  refers to supply pins and corresponding grounds:  $V_{DD\_HV\_IO\_MAIN}$ ,  $V_{DD\_HV\_IO\_FLEX}$ ,  $V_{DD\_HV\_IO\_JTAG}$ ,  $V_{DD\_HV\_OSC}$ ,  $V_{DD\_HV\_FLA}$ .
- <sup>14</sup> Relative value can be exceeded if design measures are taken to ensure injection current limitation (parameters  $I_{INJD}$  and  $I_{INJA}$ ).
- <sup>15</sup> Sum of all controller pins (including both digital and analog) must not exceed 200 mA. A  $V_{DD\_HV\_IO}$  power segment is defined as one or more GPIO pins located between two  $V_{DD\_HV\_IO}$  supply pins.
- <sup>16</sup> Solder profile per IPC/JEDEC J-STD-020D
- <sup>17</sup> Moisture sensitivity per JEDEC test method A112
- <sup>18</sup> Three Screen done, 1 minute each. No change in device parameters during characterization of at least 10 devices at 30 minutes exposure of 150 KeV at maximum 5 mm.

## 3.3 Electrostatic discharge (ESD)

The following table describes the ESD ratings of the device.

**Table 7. ESD ratings<sup>1,2</sup>**

Parameter	Conditions	Value	Unit
ESD for Human Body Model (HBM) <sup>3</sup>	All pins	2000	V
ESD for field induced Charged Device Model (CDM) <sup>4</sup>	All pins	500	V

<sup>1</sup> All ESD testing is in conformity with CDF-AEC-Q100 Stress Test Qualification for Automotive Grade Integrated Circuits.

<sup>2</sup> Device failure is defined as: "If after exposure to ESD pulses, the device does not meet the device specification requirements, which includes the complete DC parametric and functional testing at room temperature and hot temperature. Maximum DC parametrics variation within 10% of maximum specification"

<sup>3</sup> This parameter tested in conformity with ANSI/ESD STM5.1-2007 Electrostatic Discharge Sensitivity Testing

<sup>4</sup> This parameter tested in conformity with ANSI/ESD STM5.3-1990 Charged Device Model - Component Level

## 3.4 Operating conditions

The following table describes the operating conditions for the device for which all specifications in the data sheet are valid, except where explicitly noted.

The device operating conditions must not be exceeded or the functionality of the device is not guaranteed.

**Table 8. Device operating conditions<sup>1</sup>**

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
Frequency							
f <sub>SYS</sub>	SR	Device operating frequency <sup>2</sup>	T <sub>J</sub> = −40 °C to 150 °C	—	—	300	MHz

Table 8. Device operating conditions<sup>1</sup> (continued)

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
Temperature							
T <sub>J</sub>	SR	Operating temperature range - junction	—	−40.0	—	150.0	°C
T <sub>A</sub> (T <sub>L</sub> to T <sub>H</sub> )	SR	Ambient operating temperature range	—	−40.0	—	125.0	°C
Voltage							
V <sub>DD_LV</sub>	SR	External core supply voltage <sup>3,4</sup>	LVD/HVD enabled	1.24	—	1.38 <sup>5</sup>	V
			LVD/HVD disabled <sup>6,7,8,9</sup>	1.19	—	1.38 <sup>5</sup>	
V <sub>DD_HV_IO_MAIN</sub> <sup>10,11</sup>	SR	I/O supply voltage	LVD400/HVD600 enabled <sup>18</sup>	4.5	—	5.5 <sup>12</sup>	V
			LVD400/HVD600 disabled <sup>6,13,14,15,18</sup>	4.2	—	5.5	
			LVD360/HVD600 disabled <sup>6,13,14,16,17,18</sup>	3.0	—	5.5	
V <sub>DD_HV_IO_JTAG</sub>	SR	JTAG I/O supply voltage <sup>6,19</sup>	5 V range	4.5	—	5.5	V
			3.3 V range	3.0	—	3.6	
V <sub>DD_HV_IO_FLEX</sub>	SR	FlexRay I/O supply voltage	5 V range	4.5	—	5.5	V
			3.3 V range	3.0	—	3.6	
V <sub>DD_HV_IO_FLEXE</sub>	SR	FlexRay/EBI I/O supply voltage	5 V range	4.5	—	5.5	V
			3.3 V range	3.0	—	3.6	
V <sub>DD_HV_IO_EBI</sub>	SR	External Bus Interface supply voltage	5 V range	4.5	—	5.5	V
			3.3 V range	3.0	—	3.6	
V <sub>DD_HV_OSC</sub>	SR	Oscillator supply voltage <sup>6,20</sup>	5 V range	4.5	—	5.5	V
			3.3 V range	3.0	—	3.6	
V <sub>DD_HV_PMC</sub> <sup>21</sup>	SR	Power Management Controller (PMC) supply voltage	Full functionality <sup>22,23</sup>	3.5 <sup>24,25</sup>	—	5.5	V
			Reduced internal regulator output capability <sup>26</sup>	3.15	—	3.5	
			Supply monitoring activity only (LVD/HVD)	3.0	—	3.15	
V <sub>DDSTBY</sub>	SR	RAM standby supply voltage <sup>27,28,29</sup>	—	1.1	—	5.5	V
V <sub>DD_HV_ADV</sub>	SR	SARADC, SDADC, Temperature Sensor, and Bandgap Reference supply voltage	LVD400 enabled	4.5	—	5.5	V
			LVD400 disabled <sup>30,31,34</sup>	4.0	—	5.5 <sup>32</sup>	
			LVD300 disabled <sup>6,30,31,33,34</sup>	3.7	—	5.5 <sup>32</sup>	

Table 8. Device operating conditions<sup>1</sup> (continued)

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
V <sub>DD_HV_ADR_D</sub>	SR	SD ADC supply reference voltage	Reduced SNR	3.0	V <sub>DD_HV_ADV_D</sub>	4.5	V
			Full SNR	4.5		5.5 <sup>32</sup>

V <sub>por_rel</sub>	CC	POR release trip point	–40 °C < T <sub>j</sub> < 150 °C	3.10	—	4.26	V
V <sub>por_hys</sub>	CC	POR hysteresis	–40 °C < T <sub>j</sub> < 150 °C	150	—	300	mV
V <sub>IN</sub>	SR	I/O input voltage range	—	0	—	5.5	V
Injection current							
I <sub>IC</sub>	SR	DC injection current (per pin) <sup>36,37,38</sup>	Digital pins and analog pins	–3.0	—	3.0	mA
I <sub>MAXSEG</sub>	SR	Maximum current per power segment <sup>39</sup>	—	–80	—	80	mA

<sup>1</sup> The ranges in this table are design targets and actual data may vary in the given range.

<sup>2</sup> Maximum operating frequency is applicable to the computational cores and platform for the device. See the Clocking chapter in the *MPC5777M Microcontroller Reference Manual* for more information on the clock limitations for the various IP blocks on the device.

<sup>3</sup> Core voltage as measured on device pin to guarantee published silicon performance.

<sup>4</sup> During power ramp, voltage measured on silicon might be lower. maximum performance is not guaranteed, but correct silicon operation is guaranteed. Refer to the Power Management and Reset Generation Module chapters in the *MPC5777M Microcontroller Reference Manual* for further information.

- <sup>5</sup> Although the maximum  $V_{DD\_LV}$  operating voltage is 1.38 V, reset is not entered at that voltage. An external voltage monitor is needed or the HVD140\_C can be monitored (via an interrupt or by polling the HVD140\_C flag bit). Performance above 1.38 V is not guaranteed, and allowed operation above 1.38 V is defined in Absolute maximum ratings.
- <sup>6</sup> In the LVD/HVD disabled case, it is necessary for the system to be within a higher voltage range during destructive reset events.
- <sup>7</sup> Maximum core voltage is not permitted for entire product life. See *Absolute maximum rating*.
- <sup>8</sup> When internal LVD/HVDs are disabled, external monitoring is required to guarantee correct device operation.
- <sup>9</sup>  $V_{DD\_LV}$  should be above 1.24 V during destructive resets or POR events.
- <sup>10</sup>  $V_{DD\_HV\_IO\_MAIN}$  range limited to 4.75–5.25 V when  $FERS = 1$  to enable the fast erase time of the flash memory.
- <sup>11</sup> During power up operation, the minimum required voltage to come out of reset state is determined by the  $V_{PORUP\_HV}$  monitor, which is defined in the voltage monitor electrical characteristics table. Note that the  $V_{PORUP\_HV}$  monitor is connected to the  $V_{DD\_HV\_IO\_MAIN0}$  physical I/O segment.
- <sup>12</sup> When the LVD/HVDs are enabled, the  $V_{DD\_HV\_IO\_MAIN}$  must be less than 5.412 V to exit from a destructive reset.
- <sup>13</sup> Maximum voltage is not permitted for entire product life. See *Absolute maximum rating*.
- <sup>14</sup> When internal LVD/HVDs are disabled, external monitoring is required to guarantee device operation. Failure to monitor externally supply voltage may result in erroneous operation of the device.
- <sup>15</sup> When these LVD/HVDs are disabled, the  $V_{DD\_HV\_IO\_MAIN}$  supply must be between 3.182 V and 5.412 V.
- <sup>16</sup> Reduced output capabilities below 4.2 V. See performance derating values in *I/O pad electrical characteristics*.
- <sup>17</sup> When the LVD/HVDs are disabled, the  $V_{DD\_HV\_IO\_MAIN}$  must be between 3.024 V and 5.412 V.
- <sup>18</sup> The PMC supply voltage ( $V_{DD\_HV\_PMC}$ ) must be within the correct range (see the  $V_{DD\_HV\_PMC}$  specification).
- <sup>19</sup> When the LVD/HVDs are disabled, the HV I/O JTAG supply ( $V_{DD\_HV\_IO\_JTAG}$ ) must be above 3.024 V.
- <sup>20</sup> When the LVD/HVDs are disabled, the HV OSC supply ( $V_{DD\_HV\_OSC}$ ) must be above 3.024 V.
- <sup>21</sup> Flash read operation is supported for a minimum  $V_{DD\_HV\_PMC}$  value of 3.15 V. Flash read, program, and erase operations are supported for a minimum  $V_{DD\_HV\_PMC}$  value of 3.5 V.
- <sup>22</sup> When the LVD/HVDs are disabled, the  $V_{DD\_HV\_PMC}$  must be below 5.412 V during destructive reset events.
- <sup>23</sup> A minimum of 4.5 V is required to guarantee correct user logic BIST operation.
- <sup>24</sup> During power up operation, the minimum required voltage to come out of reset state is determined by the  $V_{PORUP\_HV}$  monitor, which is defined in the voltage monitor electrical characteristics table. Note that the  $V_{PORUP\_HV}$  monitor is connected to the  $V_{DD\_HV\_IO\_MAIN0}$  physical I/O segment.
- <sup>25</sup> Above  $T_a = 25^\circ\text{C}$ , the minimum  $V_{DD\_HV\_PMC}$  voltage is 3.6 V.
- <sup>26</sup> With the reduced internal regulator output capability, erases and writes to the device flash cannot be guaranteed for a single event and multiple erases and writes may be necessary. User logic BIST is not supported with reduced capability.
- <sup>27</sup> RAM data retention is guaranteed at a voltage that is always below the maximum brownout flag trip point voltage (see the DC Electrical Specification table). The minimum  $V_{DDSTBY}$  voltage at the pin is larger in order to account for on-chip IR drop and noise. There is no effect on RAM operation when  $V_{DDSTBY}$  is below 1.1 V, and  $V_{DD\_LV}$  is above the minimum operating value.
- <sup>28</sup> Non-regulated supplies can be used on the  $V_{DDSTBY}$  pin if the absolute maximum and operating condition voltage limits are met. There is no static clamp to a supply rail for the  $V_{DDSTBY}$  pin, only dynamic protection for ESD events.
- <sup>29</sup> The  $V_{DDSTBY}$  pin should be connected to ground in the application when the standby RAM feature is not used.
- <sup>30</sup>  $V_{DD\_HV\_ADV\_S}$  is required to be between 4.5 V and 5.5 V to read the internal Temperature Sensor and Bandgap Reference.
- <sup>31</sup> SAR ADC only. SDADC minimum is 4.5 V.
- <sup>32</sup> The ADC is functional up to 5.9V with no reliability issues, but performance is not guaranteed.
- <sup>33</sup> When the LVD/HVDs are disabled, the HV ADC supply ( $V_{DD\_HV\_ADV}$ ) must be above 3.182 V.
- <sup>34</sup> For supply voltages between 3.0 V and 4.0 V there is no guaranteed precision of ADC (accuracy/linearity). ADCs recover to a fully functional state when the voltage rises above 4.0 V.
- <sup>35</sup>  $V_{DD\_HV\_ADR\_S}$  must be between 4.5 V and 5.5 V for accurate reading of the device Temperature Sensor.
- <sup>36</sup> Full device lifetime without performance degradation
- <sup>37</sup> I/O and analog input specifications are only valid if the injection current on adjacent pins is within these limits. See the *Absolute maximum ratings* table for maximum input current for reliability requirements.

## Electrical characteristics

- <sup>38</sup> The I/O pins on the device are clamped to the I/O supply rails for ESD protection. When the voltage of the input pin is above the supply rail, current is injected through the clamp diode to the supply rail. For external RC network calculation, assume typical 0.3 V drop across the active diode. The diode voltage drop varies with temperature.
- <sup>39</sup> Sum of all controller pins (including both digital and analog) must not exceed 200 mA. A  $V_{DD\_HV\_IO}$  power segment is defined as one or more GPIO pins located between two  $V_{DD\_HV\_IO}$  supply pins.

**Table 9. Emulation (buddy) device operating conditions<sup>1</sup>**

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
Frequency							
—	SR	Standard JTAG 1149.1/1149.7 frequency	—	—	—	50	MHz
—	SR	High-speed debug frequency	—	—	—	320	MHz
—	SR	Data trace frequency	—	—	—	1250	MHz
Temperature							
T <sub>J_BD</sub>	SR	Device junction operating temperature range	—	−40.0	—	150.0	°C
T <sub>A_BD</sub>	SR	Ambient operating temperature range	—	−40.0	—	125.0	°C
Voltage							
V <sub>DD_LV_BD</sub>	SR	Buddy core supply voltage	—	1.2	—	1.365	V
V <sub>DD_HV_IO_BD</sub>	SR	Buddy I/O supply voltage	—	3.0	—	5.5	V
V <sub>RAMP_LV_BD</sub>	SR	Buddy slew rate on core power supply pins	—	—	—	100	V/ms
V <sub>RAMP_HV_BD</sub>	SR	Buddy slew rate on HV power supply pins	—	—	—	100	V/ms

<sup>1</sup> The ranges in this table are design targets and actual data may vary in the given range.

## 3.5 DC electrical specifications

The following table describes the DC electrical specifications.

**Table 10. DC electrical specifications<sup>1</sup>**

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
$I_{DD\_LV}$	CC	Maximum operating current on the $V_{DD\_LV}$ supply <sup>2</sup>	$T_J = 150\text{ °C}$ $V_{DD\_LV} = 1.325\text{ V}$ $f_{MAX}$	—	—	1140	mA
$I_{DDAPP\_LV}$	CC	Application use case operating current on the $V_{DD\_LV}$ supply <sup>3</sup>	$T_J = 150\text{ °C}$ $V_{DD\_LV} = 1.325\text{ V}$ $f_{MAX}$	—	—	950	mA
$I_{DD\_LV\_PE}$	CC	Operating current on the $V_{DD\_LV}$ supply for flash program/erase	$T_J = 150\text{ °C}$	—	—	40	mA

Table 10. DC electrical specifications<sup>1</sup> (continued)

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
I <sub>DD_HV_PMC</sub>	CC	Operating current on the V <sub>DD_HV_PMC</sub> supply <sup>4,5</sup>	Flash read	—	—	10	mA
			Flash P/E	—	—	40	
			PMC only	—	—	25 <sup>6</sup>	
I <sub>DD_MAIN_CORE_AC</sub> <sup>7</sup>	CC	Main Core 0/1 dynamic operating current	300 MHz	—	—	115	mA
I <sub>DD_CHKR_CORE_AC</sub>	CC	Checker Core 0 dynamic operating current	300 MHz	—	—	80	mA
I <sub>DD_HSM_AC</sub>	CC	HSM platform dynamic operating current	100 MHz	—	—	20	mA
I <sub>DDSTBY_RAM</sub>	CC	64 KB RAM Standby Leakage Current (RAM not operational) <sup>8,9,10,11</sup>	V <sub>DDSTBY</sub> @ 1.1 V to 5.5 V, T <sub>J</sub> = 150 °C	—	—	350	μA
	CC		V <sub>DDSTBY</sub> @ 1.1 V to 5.5 V, T <sub>A</sub> = 40 °C	—	—	60	
	CC		V <sub>DDSTBY</sub> @ 1.1 V to 5.5 V, T <sub>A</sub> = 85 °C	—	—	100	
I <sub>DDSTBY_REG</sub>	CC	64 KB RAM Standby Leakage Current <sup>12</sup>	V <sub>DDSTBY</sub> @ 1.3 V to 5.5 V, T <sub>A</sub> = 125 °C	—	—	50	μA
I <sub>DD_LV_BD</sub>	CC	BD Debug/Emulation low voltage supply operating current <sup>13</sup>	T <sub>J</sub> = 150 °C V <sub>DD_LV_BD</sub> = 1.32 V	—	—	290	mA
I <sub>DD_HV_IO_BD</sub>	CC	Debug/Emulation high voltage supply operating current (Aurora + JTAGM/LFAST)	T <sub>J</sub> = 150 °C	—	—	130	mA
I <sub>DD_BD_STBY</sub>	CC	BD Debug/Emulation low voltage supply standby current <sup>14,15</sup>	V <sub>DD_LV_BD</sub> = 1.32 V, T <sub>J</sub> = 150 °C	—	—	230	mA
	CC		V <sub>DD_LV_BD</sub> = 1.32 V, T <sub>J</sub> = 55 °C	—	—	5	
I <sub>SPIKE</sub>	CC	Maximum short term current spike <sup>16</sup>	< 20 μs observation window	—	—	90	mA
dl	CC	Current difference ratio to average current (dl/avg(I)) <sup>17</sup>	20 μs observation window	—	—	20	%

Table 10. DC electrical specifications<sup>1</sup> (continued)

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
$I_{SR}^{18}$	CC	Current variation during power up/down	See footnote <sup>19</sup>	—	—	90	mA
$I_{BG}$	CC	Bandgap reference current consumption		—	—	600	$\mu$ A
$I_{DDOFF}$	CC	Power-off current on high voltage supply rails <sup>20</sup>	$V_{DD\_HV} = 2.5$ V	100	—	—	$\mu$ A
$V_{STBY\_BO}$	CC	Standby RAM brownout flag trip point voltage	—	—	—	0.9 <sup>21</sup>	V
$V_{DD\_LV\_STBY\_SW}$	CC	Standby RAM switch VDD_LV voltage threshold	—	0.93	—	—	V
$V_{REF\_BG\_T}$	CC	Bandgap trimmed reference voltage	$T_J = -40$ °C to 150 °C $V_{DD\_HV\_ADV} = 5$ V $\pm$ 10%	1.200	—	1.237	V
$V_{REF\_BG\_TC}$	CC	Bandgap temperature coefficient <sup>22</sup>	$T_J = -40$ °C to 150 °C $V_{DD\_HV\_ADV} = 5$ V	—	—	50	ppm/°C
$V_{REF\_BG\_LR}$	CC	Bandgap line regulation <sup>22</sup>	$T_J = -40$ °C $V_{DD\_HV\_ADV} = 5$ V $\pm$ 10%	—	—	8000	ppm/V
			$T_J = 150$ °C $V_{DD\_HV\_ADV} = 5$ V $\pm$ 10%	—	—	4000	

<sup>1</sup> All parameters in this data sheet are valid for operation within an operating range of  $-40$  °C  $\leq T_J \leq 150$  °C except where otherwise noted

<sup>2</sup>  $f_{MAX}$  as specified per IP. Excludes flash P/E and HSM dynamic current. Measured on an application specific pattern. Calculation of total current for the device, all rails, is done by adding the applicable dynamic currents to the  $I_{DD\_LV}$  value for the core supply, and summing the currents based on use case for the 5 V blocks, for which current consumption values are defined in later sections of the DC electrical specification.

<sup>3</sup>  $f_{MAX}$  as specified per IP. Excludes flash P/E and HSM dynamic current. Measured on an application specific pattern.

<sup>4</sup>  $V_{DD\_HV\_PMC}$  only available in the 416 BGA package. PMC supply is shorted to  $V_{DD\_HV\_IO\_MAIN}$  in the 512 BGA, with an external bypass capacitor connected to the  $V_{DD\_HV\_PMC\_BYP}$  ball. The flash read and P/E current, and PMC current apply to  $V_{DD\_HV\_IO\_MAIN}$  for the 512 BGA.

<sup>5</sup> The flash read and flash P/E currents are mutually exclusive, and are not cumulative.

<sup>6</sup> This includes PMC consumption, LFAST PLL regulator current, and Nwell bias regulator current. If the  $V_{DD\_LV}$  auxiliary regulator is enabled, the PMC supply may see short term (10  $\mu$ s) spikes of up to 150 mA depending on transient current conditions from use case of the device. The auxiliary regulator can be disabled at power-up in the user DCF clients in the flash memory.

<sup>7</sup> There is an additional 25 mA when  $FERS = 1$  to enable the fast erase time of the flash memory.

<sup>8</sup> Data is retained for full  $T_J$  range of  $-40$  °C to 150 °C. RAM supply switch to the standby regulator occurs when the  $V_{DD\_LV}$  supply falls below 0.95V.

- <sup>9</sup>  $V_{DDSTBY}$  may be supplied with a non-regulated power supply, but the absolute maximum voltage on  $V_{DDSTBY}$  given in the absolute maximum ratings table must be observed.
- <sup>10</sup> Standby current is reduced by a factor of two from  $T_J=150\text{ }^{\circ}\text{C}$ , for approximately every  $\sim 20\text{ }^{\circ}\text{C}$  drop in operating temperature.
- <sup>11</sup> The maximum value for  $I_{DDSTBY\_ON}$  is also valid when switching from the core supply to the standby supply, and when powering up the device and switching the RAM supply back to  $V_{DD\_LV}$ .
- <sup>12</sup> The standby RAM regulator current is present on the  $V_{DDSTBY}$  pin whenever a voltage is applied to the pin. This also applies to normal operation where the RAM is powered by the  $V_{DD\_LV}$  supply. Connecting the  $V_{DDSTBY}$  pin to ground when not using the standby RAM feature will remove the leakage current on the  $V_{DDSTBY}$  pin.
- <sup>13</sup> If Aurora and JTAGM/LFAST not used,  $V_{DD\_LV\_BD}$  current is reduced by  $\sim 20\text{mA}$ .
- <sup>14</sup> Applies to 2MB calibration RAM in the BD.
- <sup>15</sup> Buddy device leakage dependency on temperature can be estimated by dividing the  $150\text{ }^{\circ}\text{C}$  leakage by two for each temperature drop of  $\sim 20\text{ }^{\circ}\text{C}$ .
- <sup>16</sup> Current spike may occur during normal operation that are above average current, valid for  $I_{DDAPP}$  and its conditions given in [Table 10 \(DC electrical specifications\)](#). Internal schemes must be used (eg frequency ramping, feature enable) to ensure that incremental demands are made on the external power supply. An internal fast regulator providing  $\sim 40\text{mA}$  peak current within  $1\text{ }\mu\text{s}$  to filter any core power supply droops is available on the device. Assumption is minimum  $13.3\text{ }\mu\text{F}$  ( $20\text{ }\mu\text{F}$  typical) capacitance on the core supply.]
- <sup>17</sup> Moving window, valid for  $I_{DDAPP}$  and its conditions given in [Table 10 \(DC electrical specifications\)](#), with a maximum of  $90\text{ mA}$  for the worst case application
- <sup>18</sup> This specification is the maximum value and is a boundary for the dl specification.
- <sup>19</sup> Condition1: For power on period from  $0\text{ V}$  up to normal operation with reset asserted. Condition 2: From reset asserted until PLL running free. Condition 3: Increasing PLL from free frequency to full frequency. Condition 4: reverse order for power down to  $0\text{ V}$ .
- <sup>20</sup>  $I_{DDOFF}$  is the minimum guaranteed consumption of the device during power-up. It can be used to correctly size power-off ballast in case of current injection during power-off state. Power up/down current transients can be limited by controlling the clock ramp rates with the Progressive Clock Frequency Switching block on the device.
- <sup>21</sup>  $V_{STBY\_BO}$  is the maximum voltage that sets the standby RAM brown-out flag in the device logic. The minimum voltage for RAM data retention is guaranteed to always be less than the  $V_{STBY\_BO}$  maximum value.
- <sup>22</sup> The temperature coefficient and line regulation specifications are used to calculate the reference voltage drift at an operating point within the specified voltage and temperature operating conditions.

## 3.6 I/O pad specification

The following table describes the different pad type configurations.

**Table 11. I/O pad specification descriptions**

Pad type	Description
Weak configuration	Provides a good compromise between transition time and low electromagnetic emission. Pad impedance is centered around $800\text{ }\Omega$ .
Medium configuration	Provides transition fast enough for the serial communication channels with controlled current to reduce electromagnetic emission. Pad impedance is centered around $200\text{ }\Omega$ .
Strong configuration	Provides fast transition speed; used for fast interface. Pad impedance is centered around $50\text{ }\Omega$ .
Very strong configuration	Provides maximum speed and controlled symmetric behavior for rise and fall transition. Used for fast interface including Ethernet, FlexRay, and the EBI data bus interfaces requiring fine control of rising/falling edge jitter. Pad impedance is centered around $40\text{ }\Omega$ .
EBI configuration	Provides necessary speed for fast external memory interfaces on the EBI address and control signals. Drive strength is matched to four selectable loads.

Table 11. I/O pad specification descriptions (continued)

Pad type	Description
Differential configuration	A few pads provide differential capability providing very fast interface together with good EMC performances.
Input only pads	These low input leakage pads are associated with the ADC channels.

**NOTE**

Each I/O pin on the device supports specific drive configurations. See the signal description table in the device reference manual for the available drive configurations for each I/O pin.

The device supports both 3.3 V and 5 V nominal I/O voltages. In order to use 3.3 V on the  $V_{DD\_HV\_IO\_MAIN0}$  physical I/O segment, the HV supply low voltage monitor ( $V_{LVD400}$ ) must be disabled by DCF client. All other physical I/O segments are unaffected by the LVD400.

### 3.6.1 I/O input DC characteristics

Table 12 provides input DC electrical characteristics as described in Figure 7.

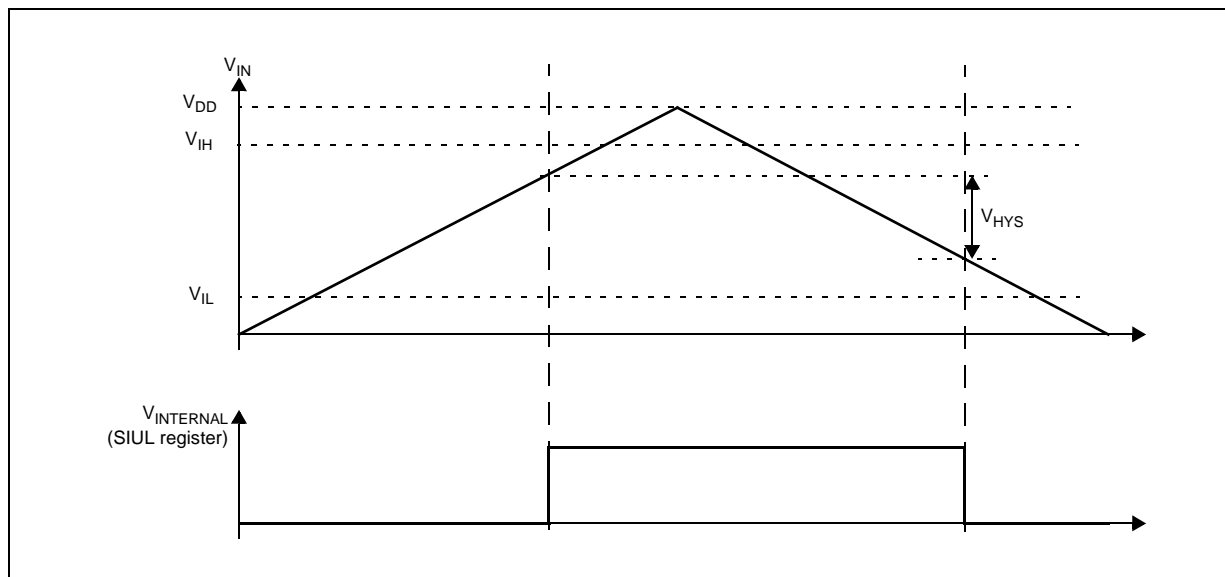

Figure 7. I/O input DC electrical characteristics definition

Table 12. I/O input DC electrical characteristics

Symbol		Parameter	Conditions <sup>1</sup>	Value			Unit
				Min	Typ	Max

INPUT CHARACTERISTICS <sup>8</sup>							
I <sub>LKG</sub>	CC	Digital input leakage	4.5 V < V <sub>DD_HV</sub> < 5.5 V V <sub>SS_HV</sub> < V <sub>IN</sub> < V <sub>DD_HV</sub> T <sub>J</sub> = 150 °C	—	—	750	nA
I <sub>LKG_EBI</sub>	CC	Digital input leakage for EBI pad	4.5 V < V <sub>DD_HV</sub> < 5.5 V V <sub>SS_HV</sub> < V <sub>IN</sub> < V <sub>DD_HV</sub> T <sub>J</sub> = 150 °	—	—	750	nA
C <sub>IN</sub>	CC	Digital input capacitance	GPIO input pins	—	—	7	pF
			EBI input pins	—	—	7	

<sup>1</sup> During power up operation, the minimum required voltage to come out of reset state is determined by the V<sub>PORUP\_HV</sub> monitor, which is defined in the voltage monitor electrical characteristics table. Note that the V<sub>PORUP\_HV</sub> monitor is connected to the V<sub>DD\_HV\_IO\_MAIN0</sub> physical I/O segment.

## Electrical characteristics

- <sup>2</sup> A good approximation for the variation of the minimum value with supply is given by formula  $V_{IHAUT} = 0.69 \times V_{DD\_HV\_IO}$ .
- <sup>3</sup> A good approximation for the variation of the maximum value with supply is given by formula  $V_{ILAUT} = 0.49 \times V_{DD\_HV\_IO}$ .
- <sup>4</sup> A good approximation of the variation of the minimum value with supply is given by formula  $V_{HYSAUT} = 0.11 \times V_{DD\_HV\_IO}$ .
- <sup>5</sup> In a 1 ms period, assuming stable voltage and a temperature variation of  $\pm 30^\circ\text{C}$ ,  $V_{IL}/V_{IH}$  shift is within  $\pm 50\text{ mV}$ . For SENT requirement refer to NOTE on page 41.
- <sup>6</sup> Only for  $V_{DD\_HV\_IO\_JTAG}$  and  $V_{DD\_HV\_IO\_FLEX}$  power segment. The TTL threshold are controlled by the VSIO bit.  $VSIO[VSIO\_xx] = 0$  in the range  $3.0\text{ V} < V_{DD\_HV\_IO} < 4.0\text{ V}$ ,  $VSIO[VSIO\_xx] = 1$  in the range  $4.5\text{ V} < V_{DD\_HV\_IO} < 5.5\text{ V}$ .
- <sup>7</sup> Only for  $V_{DD\_HV\_IO\_JTAG}$  and  $V_{DD\_HV\_IO\_FLEX}$  power segment.
- <sup>8</sup> For LFAST, microsecond bus and LVDS input characteristics, refer to dedicated communication module chapters.

Table 13 provides weak pull figures. Both pull-up and pull-down current specifications are provided.

**Table 13. I/O pull-up/pull-down DC electrical characteristics**

			V <sub>IN</sub> = 0.65* V <sub>DD_HV_IO</sub> (CMOS) 4.5 V < V <sub>DD_HV_IO</sub> < 5.5 V	40	—	120	
R <sub>WPD</sub>	CC	Weak pull-down resistance	—	30	—	55	kΩ

<sup>1</sup> During power up operation, the minimum required voltage to come out of reset state is determined by the V<sub>PORUP\_HV</sub> monitor, which is defined in the voltage monitor electrical characteristics table. Note that the V<sub>PORUP\_HV</sub> monitor is connected to the V<sub>DD\_HV\_IO\_MAIN0</sub> physical I/O segment.

<sup>2</sup> Weak pull-up/down is enabled within t<sub>WK\_PU</sub> = 1  $\mu\text{s}$  after internal/external reset has been asserted. Output voltage will depend on the amount of capacitance connected to the pin.

<sup>3</sup> V<sub>DD\_POR</sub> is the minimum V<sub>DD\_HV\_IO</sub> supply voltage for the activation of the device pull-up/down, and is given in the *Reset electrical characteristics* table of Section *Reset pad (PORST, ESR0) electrical characteristics* in this Data Sheet.

<sup>4</sup> V<sub>DD\_POR</sub> is defined in the *Reset electrical characteristics* table of Section *Reset pad (PORST, ESR0) electrical characteristics* in this Data Sheet.

<sup>5</sup> Weak pull-up behavior during power-up. Operational with V<sub>DD\_HV\_IO</sub> > V<sub>DD\_POR</sub>.

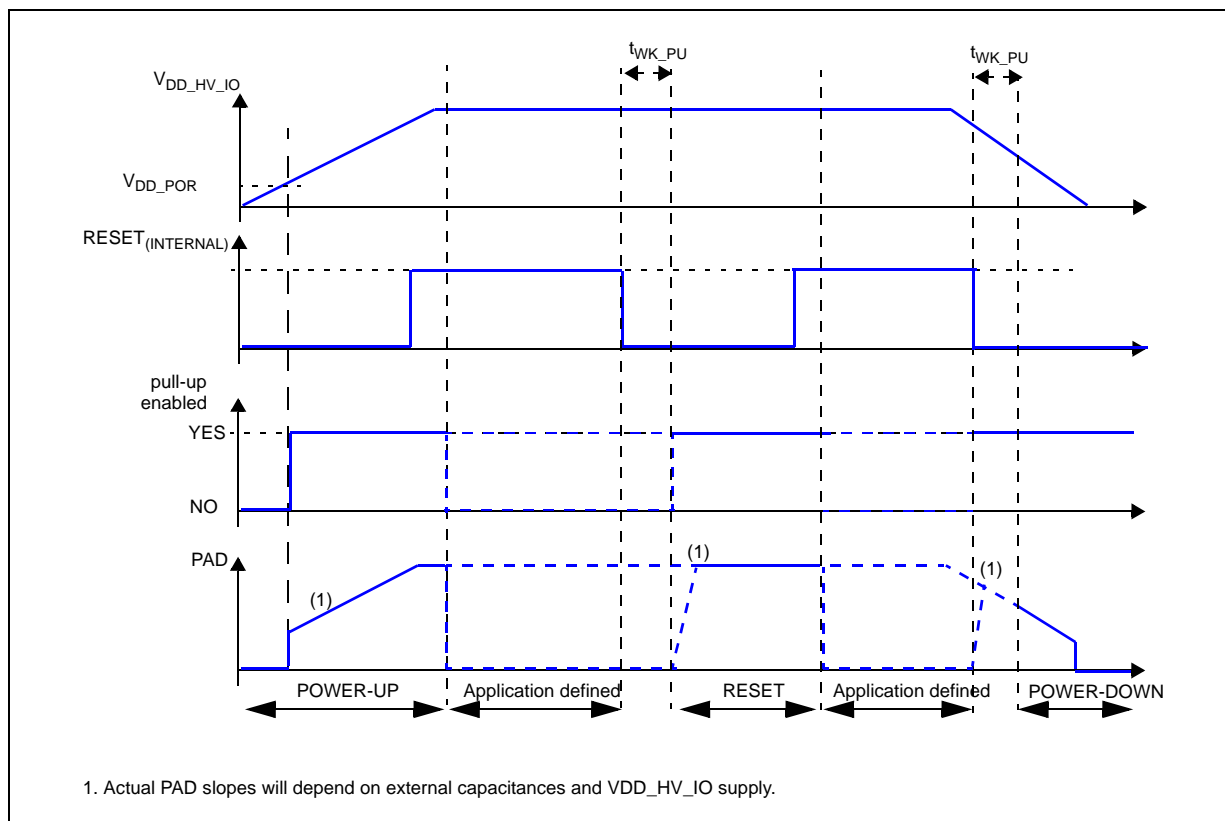

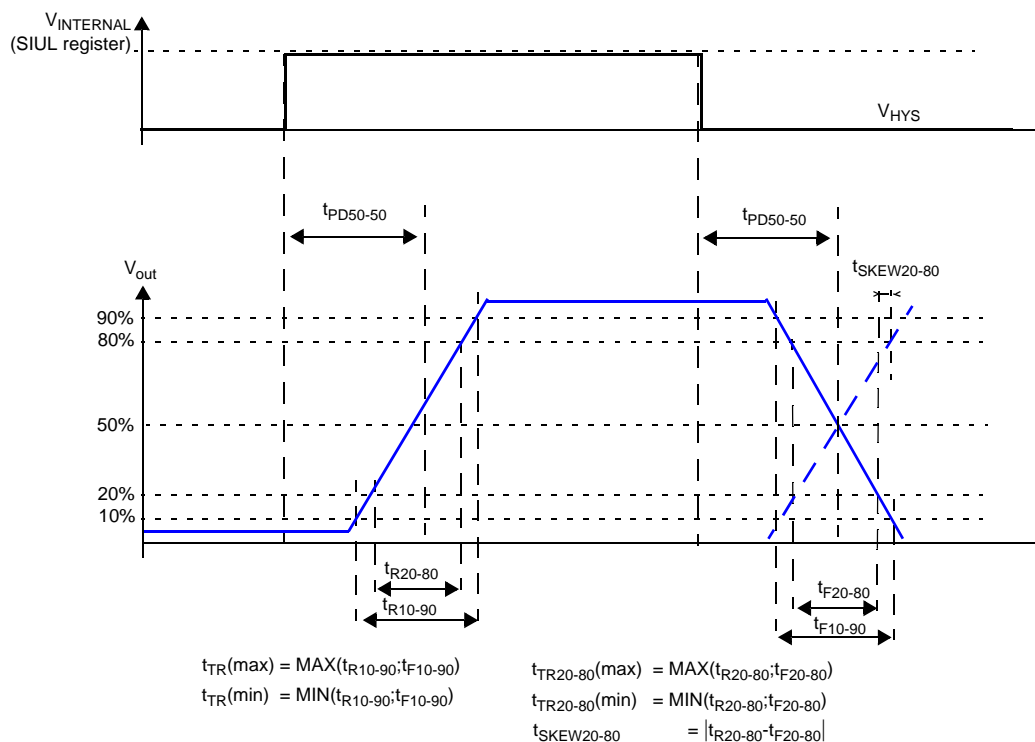

Figure 8. Weak pull-up electrical characteristics definition

### 3.6.2 I/O output DC characteristics

The figure below provides description of output DC electrical characteristics.

**Figure 9. I/O output DC electrical characteristics definition**

The following tables provide DC characteristics for bidirectional pads:

- [Table 14](#) provides output driver characteristics for I/O pads when in WEAK configuration.
- [Table 15](#) provides output driver characteristics for I/O pads when in MEDIUM configuration.
- [Table 16](#) provides output driver characteristics for I/O pads when in STRONG configuration.
- [Table 17](#) provides output driver characteristics for I/O pads when in VERY STRONG configuration.
- [Table 18](#) provides output driver characteristics for the EBI pads.

### NOTE

Driver configuration is controlled by SIUL2\_MSCR $n$  registers. It is available within two PBRIDGEA\_CLK clock cycles after the associated SIUL2\_MSCR $n$  bits have been written.

[Table 14](#) shows the WEAK configuration output buffer electrical characteristics.

**Table 14. WEAK configuration output buffer electrical characteristics**

Symbol		Parameter	Conditions <sup>1,2</sup>	Value			Unit
				Min	Typ	Max	
R <sub>OH_W</sub>	CC	PMOS output impedance weak configuration	4.5 V < V <sub>DD_HV_IO</sub> < 5.5 V Push pull, I <sub>OH</sub> < 0.5 mA	520	800	1052	Ω
R <sub>OL_W</sub>	CC	NMOS output impedance weak configuration	4.5 V < V <sub>DD_HV_IO</sub> < 5.5 V Push pull, I <sub>OL</sub> < 0.5 mA	520	800	1052	Ω

Table 14. WEAK configuration output buffer electrical characteristics (continued)

Symbol		Parameter	Conditions <sup>1,2</sup>	Value			Unit
				Min	Typ	Max	
f <sub>MAX_W</sub>	CC	Output frequency weak configuration	C <sub>L</sub> = 25 pF <sup>3</sup>	—	—	2	MHz
			C <sub>L</sub> = 50 pF <sup>3</sup>	—	—	1	
			C <sub>L</sub> = 200 pF <sup>3</sup>	—	—	0.25	
t <sub>TR_W</sub>	CC	Transition time output pin weak configuration <sup>4</sup>	C <sub>L</sub> = 25 pF, 4.5 V < V <sub>DD_HV_IO</sub> < 5.5 V	40	—	120	ns
			C <sub>L</sub> = 50 pF, 4.5 V < V <sub>DD_HV_IO</sub> < 5.5 V	80	—	240	
			C <sub>L</sub> = 200 pF, 4.5 V < V <sub>DD_HV_IO</sub> < 5.5 V	320	—	820	
			C <sub>L</sub> = 25 pF, 3.0 V < V <sub>DD_HV_IO</sub> < 3.6 V <sup>5</sup>	50	—	150	
			C <sub>L</sub> = 50 pF, 3.0 V < V <sub>DD_HV_IO</sub> < 3.6 V <sup>5</sup>	100	—	300	
			C <sub>L</sub> = 200 pF, 3.0 V < V <sub>DD_HV_IO</sub> < 3.6 V <sup>5</sup>	350	—	1050	
t <sub>SKEW_W</sub>	CC	Difference between rise and fall time	—	—	—	25	%
I <sub>DCMAX_W</sub>	CC	Maximum DC current	—	—	—	4	mA

<sup>1</sup> All V<sub>DD\_HV\_IO</sub> conditions for 4.5V to 5.5V are valid for VSIO[VSIO\_xx] = 1, and all specifications for 3.0V to 3.6V are valid for VSIO[VSIO\_xx] = 0

<sup>2</sup> During power up operation, the minimum required voltage to come out of reset state is determined by the V<sub>PORUP\_HV</sub> monitor, which is defined in the voltage monitor electrical characteristics table. Note that the V<sub>PORUP\_HV</sub> monitor is connected to the V<sub>DD\_HV\_IO\_MAIN0</sub> physical I/O segment.

<sup>3</sup> C<sub>L</sub> is the sum of external capacitance. Device and package capacitances (C<sub>IN</sub>, defined in Table 12) are to be added to calculate total signal capacitance (C<sub>TOT</sub> = C<sub>L</sub> + C<sub>IN</sub>).

<sup>4</sup> Transition time maximum value is approximated by the following formula:

$$0 \text{ pF} < C_L < 50 \text{ pF} \quad t_{TR\_W}(\text{ns}) = 22 \text{ ns} + C_L(\text{pF}) \times 4.4 \text{ ns/pF}$$

$$50 \text{ pF} < C_L < 200 \text{ pF} \quad t_{TR\_W}(\text{ns}) = 50 \text{ ns} + C_L(\text{pF}) \times 3.85 \text{ ns/pF}$$

<sup>5</sup> Only for V<sub>DD\_HV\_IO\_JTAG</sub> segment when VSIO[VSIO\_IJ] = 0 or V<sub>DD\_HV\_IO\_FLEX</sub> segment when VSIO[VSIO\_IF] = 0.

Table 15 shows the MEDIUM configuration output buffer electrical characteristics.

Table 15. MEDIUM configuration output buffer electrical characteristics

Symbol		Parameter	Conditions <sup>1,2</sup>	Value			Unit
				Min	Typ	Max	
R <sub>OH_M</sub>	CC	PMOS output impedance MEDIUM configuration	4.5 V < V <sub>DD_HV_IO</sub> < 5.5 V Push pull, I <sub>OH</sub> < 2 mA	135	200	260	Ω
R <sub>OL_M</sub>	CC	NMOS output impedance MEDIUM configuration	4.5 V < V <sub>DD_HV_IO</sub> < 5.5 V Push pull, I <sub>OL</sub> < 2 mA	135	200	260	Ω

Table 15. MEDIUM configuration output buffer electrical characteristics (continued)

<sup>4</sup> If two values are given for propagation delay, the first value is for rising edge signals and the second for falling edge signals.

<sup>5</sup> Transition time maximum value is approximated by the following formula: t<sub>TR\_S</sub>(ns) = 4.5 ns + C<sub>L</sub>(pF) x 0.23 ns/pF.

<sup>6</sup> Only for V<sub>DD\_HV\_IO\_JTAG</sub> segment when VSIO[VSIO\_IJ] = 0 or V<sub>DD\_HV\_IO\_FLEX</sub> segment when VSIO[VSIO\_IF] = 0

Table 17 shows the VERY STRONG configuration output buffer electrical characteristics.

Table 17. VERY STRONG configuration output buffer electrical characteristics<sup>1</sup>

Symbol	Parameter	Conditions <sup>2,3</sup>	Value			Unit
			Min	Typ	Max	
R <sub>OH_V</sub>	CC	PMOS output impedance VERY STRONG configuration $V_{DD\_HV\_IO} = 5.0\text{ V} \pm 10\%$ , $VSIO[VSIO\_xx] = 1$ $I_{OH} = 8\text{ mA}$	20	40	72	$\Omega$
			30	50	90	
R <sub>OL_V</sub>	CC	NMOS output impedance VERY STRONG configuration $V_{DD\_HV\_IO} = 5.0\text{ V} \pm 10\%$ , $VSIO[VSIO\_xx] = 1$ $I_{OL} = 8\text{ mA}$	20	40	72	$\Omega$
			30	50	90	
f <sub>MAX_V</sub>	CC	Output frequency VERY STRONG configuration $V_{DD\_HV\_IO} = 5.0\text{ V} \pm 10\%$ , $C_L = 25\text{ pF}$ <sup>5</sup>	—	—	50	MHz
			—	—	50	
t <sub>TPD50-50</sub> <sup>6</sup>	CC	50-50 % Output pad propagation delay time $V_{DD\_HV\_IO} = 5\text{ V} \pm 10\%$ , $C_L = 25\text{ pF}$	—	—	5.5	ns
			—	—	6.5	ns
			—	—	7.3/7.6	ns
t <sub>TR_V</sub>	CC	10–90% threshold transition time output pin VERY STRONG configuration $V_{DD\_HV\_IO} = 5.0\text{ V} \pm 10\%$ , $C_L = 25\text{ pF}$ <sup>5</sup>	1	—	5.3	ns
			3	—	12	
			14	—	45	
t <sub>TR20-80</sub>	CC	20–80% threshold transition time <sup>7</sup> output pin VERY STRONG configuration $V_{DD\_HV\_IO} = 5.0\text{ V} \pm 10\%$ , $C_L = 25\text{ pF}$ <sup>5</sup>	0.8	—	4	ns
			1	—	5	
t <sub>TRTTL</sub>	CC	TTL threshold transition time <sup>8</sup> for output pin in VERY STRONG configuration $V_{DD\_HV\_IO} = 3.3\text{ V} \pm 10\%$ , $C_L = 25\text{ pF}$ <sup>5</sup>	1	—	5	ns
$\Sigma t_{TR20-80}$	CC	Sum of transition time 20–80% output pin VERY STRONG configuration <sup>9</sup> $V_{DD\_HV\_IO} = 5.0\text{ V} \pm 10\%$ , $C_L = 25\text{ pF}$	—	—	9	ns
			—	—	9	
t <sub>SKEW_V</sub>	CC	Difference between rise and fall time at 20–80% $V_{DD\_HV\_IO} = 5.0\text{ V} \pm 10\%$ , $C_L = 25\text{ pF}$ <sup>5</sup>	0	—	1	ns

**Table 17. VERY STRONG configuration output buffer electrical characteristics<sup>1</sup> (continued)**

Symbol	Parameter	Conditions <sup>2,3</sup>	Value			Unit
			Min	Typ	Max	
I <sub>DCMAX_VS</sub>	CC	Maximum DC current	—	—	10	mA

<sup>1</sup> Refer to FlexRay section for parameter dedicated to this interface.

<sup>2</sup> All VDD\_HV\_IO conditions for 4.5V to 5.5V are valid for VSIO[VSIO\_xx] = 1, and all specifications for 3.0V to 3.6V are valid for VSIO[VSIO\_xx] = 0.

<sup>3</sup> During power up operation, the minimum required voltage to come out of reset state is determined by the V<sub>PORUP\_HV</sub> monitor, which is defined in the voltage monitor electrical characteristics table. Note that the V<sub>PORUP\_HV</sub> monitor is connected to the V<sub>DD\_HV\_IO\_MAIN0</sub> physical I/O segment.

<sup>4</sup> Only available on the V<sub>DD\_HV\_IO\_JTAG</sub>, V<sub>DD\_HV\_IO\_FLEXE</sub>, and V<sub>DD\_HV\_IO\_FLEX</sub> segments.

<sup>5</sup> C<sub>L</sub> is the sum of external capacitance. Add device and package capacitances (C<sub>IN</sub>, defined in the I/O input DC electrical characteristics table in this Data Sheet) to calculate total signal capacitance (C<sub>TOT</sub> = C<sub>L</sub> + C<sub>IN</sub>).

<sup>6</sup> If two values are given for propagation delay, the first value is for rising edge signals and the second for falling edge signals.

<sup>7</sup> 20–80% transition time as per FlexRay standard.

<sup>8</sup> TTL transition time as for Ethernet standard.

<sup>9</sup> For specification per Electrical Physical Layer Specification 3.0.1, see the dCCTxD<sub>RISE25</sub>+dCCTxD<sub>FALL25</sub> (Sum of Rise and Fall time of Tx signal at the output pin) specification in Tx output characteristics table in Section Tx of this Data Sheet.

Table 18 shows the EBI pad electrical specification.

**Table 18. EBI pad output electrical specification**

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
EBI Mode Output Specifications <sup>1</sup>							
C <sub>DRV</sub>	CC	External Bus Load Capacitance	MSCR[OERC] = b101	—	—	10	pF
			MSCR[OERC] = b110	—	—	20	
			MSCR[OERC] = b111	—	—	30

GPIO Mode Output Specifications - MSCR[OERC] = b100							

Table 18. EBI pad output electrical specification (continued)

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
$R_{OH\_EBI\_GPIO}$	CC	PMOS output impedance	$4.5\text{ V} < V_{DD\_HV\_IO\_EBI} < 5.5\text{ V}$ Push pull, $I_{OH} < 2\text{ mA}$	100	225	400	$\Omega$
$R_{OL\_EBI\_GPIO}$	CC	NMOS output impedance	$4.5\text{ V} < V_{DD\_HV\_IO\_EBI} < 5.5\text{ V}$ Push pull, $I_{OH} < 2\text{ mA}$	100	200	400	$\Omega$
$f_{MAX\_EBI\_GPIO}$	CC	Output frequency	$C_L = 25\text{ pF}^2$	—	—	12	MHz
			$C_L = 50\text{ pF}$	—	—	6	
			$C_L = 200\text{ pF}$	—	—	1.5	
$I_{DCMAX\_EBI\_GPIO}$	CC	Maximum DC current	—	—	—	4	mA

<sup>1</sup> All EBI mode specifications are valid for  $V_{DD\_HV\_IO\_EBI} = 3.3\text{ V} \pm 10\%$ .

<sup>2</sup>  $C_L$  is the sum of the capacitance loading external to the device.

### 3.7 I/O pad current specification

The I/O pads are distributed across the I/O supply segment. Each I/O supply segment is associated to a  $V_{DD}/V_{SS}$  supply pair.

Table 19 provides I/O consumption figures.

In order to ensure device reliability, the average current of the I/O on a single segment remain below the  $I_{MAXSEG}$  value given in the Table 6 (Absolute maximum ratings). Use the RMS current consumption values to calculate total segment current.

In order to ensure device functionality, the sum of the dynamic and static currents of the I/O on a single segment should remain below the  $I_{MAXSEG}$  value given in the Table 8 (Device operating conditions). Use the dynamic current consumption values to calculate total segment current.

Pad mapping on each segment can be optimized using the pad usage information provided in the I/O Signal Description table. The sum of all pad usage ratios within a segment should remain below 100%.

#### NOTE

In order to maintain the required input thresholds for the SENT interface, the sum of all I/O pad output percent IR drop as defined in the I/O Signal Description table, must be below 50 %. See the I/O Signal Description attachment.

#### NOTE

The MPC5777M I/O Signal Description and Input Multiplexing Tables are contained in a Microsoft Excel® workbook file attached to this document. Locate the paperclip symbol on the left side of the PDF window, and click it. Double-click on the Excel file to open it and select the I/O Signal Description Table tab.

Table 19. I/O consumption<sup>1</sup>

Symbol		Parameter	Conditions <sup>2</sup>	Value			Unit
				Min	Typ	Max	
I <sub>RMS_W</sub>	CC	RMS I/O current for WEAK configuration	C <sub>L</sub> = 25 pF, 2 MHz V <sub>DD</sub> = 5.0 V ± 10%	—	—	1.1	mA
			C <sub>L</sub> = 50 pF, 1 MHz V <sub>DD</sub> = 5.0 V ± 10%	—	—	1.1	
			C <sub>L</sub> = 25 pF, 2 MHz V <sub>DD</sub> = 3.3 V ± 10%	—	—	0.6	
			C <sub>L</sub> = 50 pF, 1 MHz V <sub>DD</sub> = 3.3 V ± 10%	—	—	0.6

			C <sub>L</sub> = 50 pF, V <sub>DD</sub> = 5.0 V ± 10%	—	—	55	
			C <sub>L</sub> = 25 pF, V <sub>DD</sub> = 3.3 V ± 10%	—	—	22	
			C <sub>L</sub> = 50 pF, V <sub>DD</sub> = 3.3 V ± 10%	—	—	25	
I <sub>DYN_V</sub>	CC	Dynamic I/O current for VERY STRONG configuration	C <sub>L</sub> = 25 pF, V <sub>DD</sub> = 5.0 V ± 10%	—	—	60	mA
			C <sub>L</sub> = 50 pF, V <sub>DD</sub> = 5.0 V ± 10%	—	—	64	
			C <sub>L</sub> = 25 pF, V <sub>DD</sub> = 3.3 V ± 10%	—	—	26	
			C <sub>L</sub> = 50 pF, V <sub>DD</sub> = 3.3 V ± 10%	—	—	29	
I <sub>DYN_EBI</sub> <sup>4</sup>	CC	Dynamic I/O current for External Bus output pins	C <sub>DRV</sub> = 10 pF, f <sub>EBI</sub> = 66.7 MHz, V <sub>DD_HV_IO_EBI</sub> = 3.3 V ± 10%	—	—	30	mA
			C <sub>DRV</sub> = 20 pF, f <sub>EBI</sub> = 66.7 MHz, V <sub>DD_HV_IO_EBI</sub> = 3.3 V ± 10%	—	—	50	
			C <sub>DRV</sub> = 30 pF, f <sub>EBI</sub> = 66.7 MHz, V <sub>DD_HV_IO_EBI</sub> = 3.3 V ± 10%	—	—	80	

<sup>1</sup> I/O current consumption specifications for the 4.5 V ≤ V<sub>DD\_HV\_IO</sub> ≤ 5.5 V range are valid for VSIO\_[VSIO\_xx] = 1, and VSIO[VSIO\_xx] = 0 for 3.0 V ≤ V<sub>DD\_HV\_IO</sub> ≤ 3.6 V.

## Electrical characteristics

- 2 During power up operation, the minimum required voltage to come out of reset state is determined by the  $V_{PORUP\_HV}$  monitor, which is defined in the voltage monitor electrical characteristics table. Note that the  $V_{PORUP\_HV}$  monitor is connected to the  $V_{DD\_HV\_IO\_MAIN0}$  physical I/O segment.
- 3 Stated maximum values represent peak consumption that lasts only a few ns during I/O transition. When possible (timed output) it is recommended to delay transition between pads by few cycles to reduce noise and consumption.
- 4 For  $I_{DYN\_EBI\_GPIO}$  dynamic current for EBI GPIO mode use the  $I_{DYN\_M}$  values.

## 3.8 Reset pad ( $\overline{PORST}$ , $\overline{ESR0}$ ) electrical characteristics

The device implements a dedicated bidirectional reset pin ( $\overline{PORST}$ ).

### NOTE

$\overline{PORST}$  pin does not require active control. It is possible to implement an external pull-up to ensure correct reset exit sequence. Recommended value is 4.7 k $\Omega$ .

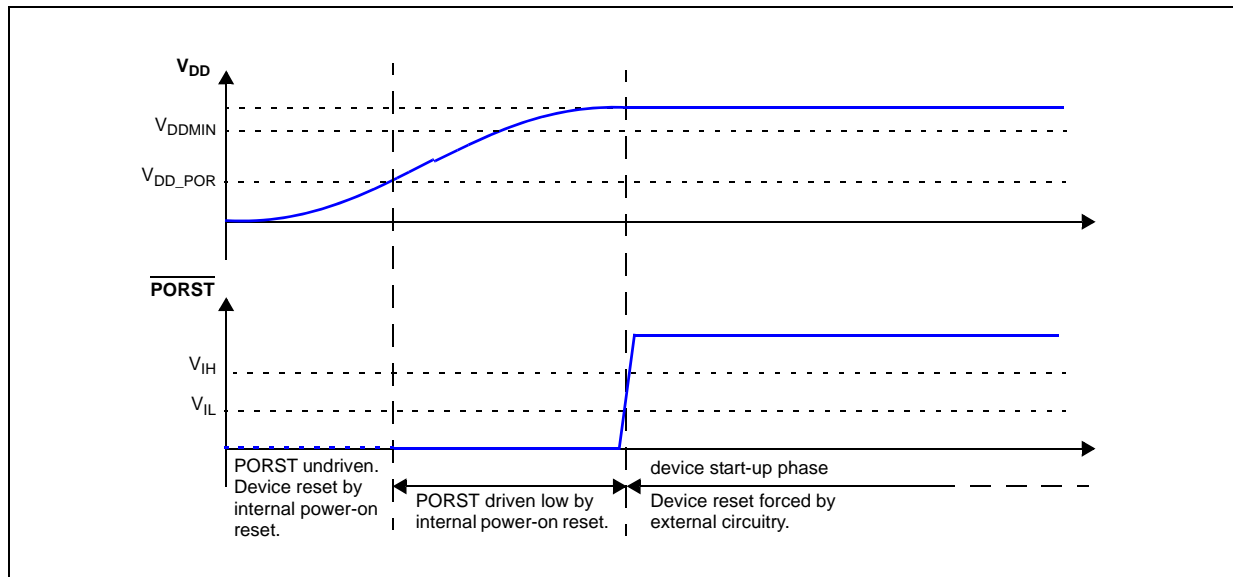

Figure 10. Start-up reset requirements

Figure 11 describes device behavior depending on supply signal on  $\overline{PORST}$ :

1.  $\overline{PORST}$  low pulse amplitude is too low—it is filtered by input buffer hysteresis. Device remains in current state.
2.  $\overline{PORST}$  low pulse duration is too short—it is filtered by a low pass filter. Device remains in current state.
3.  $\overline{PORST}$  low pulse generates a reset:
  - a)  $\overline{PORST}$  low but initially filtered during at least  $W_{FRST}$ . Device remains initially in current state.
  - b)  $\overline{PORST}$  potentially filtered until  $W_{NFRST}$ . Device state is unknown: it may either be reset or remains in current state depending on other factors (temperature, voltage, device).
  - c)  $\overline{PORST}$  asserted for longer than  $W_{NFRST}$ . Device is under reset.

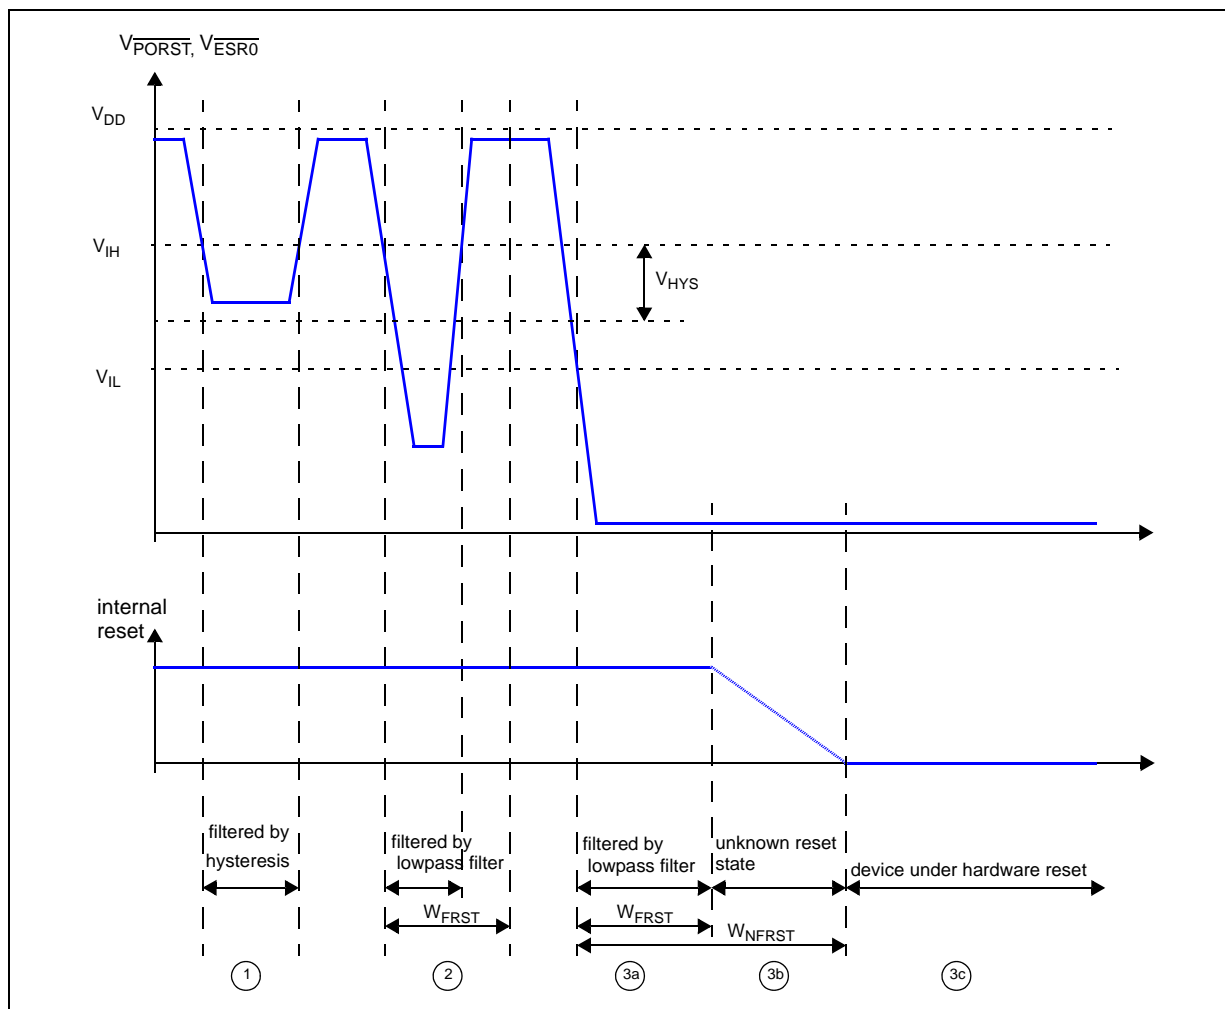

Figure 11. Noise filtering on reset signal

Table 20. Reset electrical characteristics

Symbol	Parameter	Conditions	Value <sup>1</sup>			Unit
			Min	Typ	Max	
V <sub>IH</sub>	SR Input high level TTL (Schmitt trigger)	—	2.2	—	V <sub>DD_HV_IO</sub> +0.4	V
V <sub>IL</sub>	SR Input low level TTL (Schmitt trigger)	—	−0.4	—	0.8	V
V <sub>HYS</sub>	CC Input hysteresis TTL (Schmitt trigger)	—	300	—	—	mV
V <sub>DD_POR</sub>	CC Minimum supply for strong pull-down activation	—	—	—	1.2	V

Table 20. Reset electrical characteristics (continued)

Symbol	Parameter	Conditions	Value <sup>1</sup>			Unit
			Min	Typ	Max	
I <sub>OL_R</sub>	CC	Strong pull-down current <sup>2</sup>	0.2	—	—	mA
		Device under power-on reset V <sub>DD_HV_IO</sub> = V <sub>DD_POR</sub> , V <sub>OL</sub> = 0.35 * V <sub>DD_HV_IO</sub>	11	—	—	mA
I <sub>WPU</sub>	CC	Weak pull-up current absolute value	23	—	—	μA
		ESR0 pin V <sub>IN</sub> = 0.69 * V <sub>DD_HV_IO</sub>	—	—	82	μA
I <sub>WPD</sub>	CC	Weak pull-down current absolute value	—	—	130	μA
		PORST pin V <sub>IN</sub> = 0.69 * V <sub>DD_HV_IO</sub>	40	—	—	μA
W <sub>FRST</sub>	SR	PORST and ESR0 input filtered pulse	—	—	500	ns
W <sub>NFRST</sub>	SR	PORST and ESR0 input not filtered pulse	2000	—	—	ns
W <sub>FNMI</sub>	SR	ESR1 input filtered pulse	—	—	15	ns
W <sub>NFNMI</sub>	SR	ESR1 input not filtered pulse	400	—	—	ns

<sup>1</sup> An external 4.7 KOhm pull-up resistor is recommended to be used with the PORST and ESR0 pins for fast negation of the signals.

<sup>2</sup> I<sub>OL\_R</sub> applies to both PORST and ESR0: Strong pull-down is active on PHASE0 for PORST. Strong pull-down is active on PHASE0, PHASE1, PHASE2, and the beginning of PHASE3 for ESR0.

### NOTE

PORST can optionally be connected to an external power-on supply circuitry.

### NOTE

No restrictions exist on reset signal slew rate apart from absolute maximum rating compliance.

### 3.9 Oscillator and FMPLL

The Reference PLL (PLL0) and the System PLL (PLL1) generate the system and auxiliary clocks from the main oscillator driver.

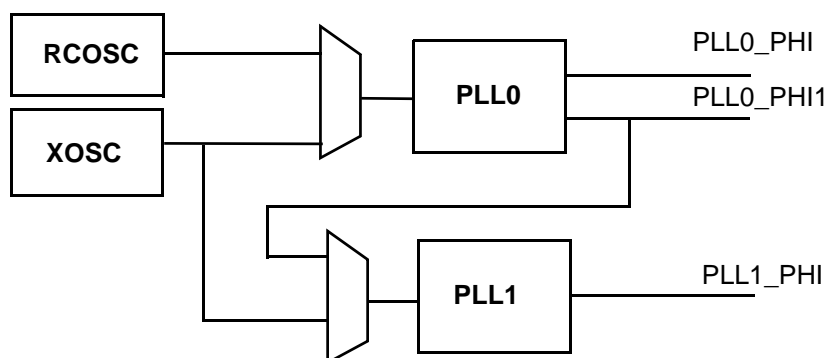

Figure 12. PLL integration

Table 21. PLL0 electrical characteristics

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
$f_{PLL0IN}$	SR	PLL0 input clock <sup>1,2</sup>	—	8	—	44	MHz
$\Delta_{PLL0IN}$	SR	PLL0 input clock duty cycle <sup>2</sup>	—	40	—	60	%
$f_{PLL0VCO}$	CC	PLL0 VCO frequency	—	600	—	1250	MHz
$f_{PLL0VCOFR}$	CC	PLL0 VCO free running frequency	—	35	—	400	MHz
$f_{PLL0PHI}$	CC	PLL0 output frequency	—	4.762	—	400	MHz
$t_{PLL0LOCK}$	CC	PLL0 lock time	—	—	—	110	$\mu$ s
$ \Delta_{PLL0PHISPJ} $	CC	PLL0_PHI single period jitter <sup>3</sup> $f_{PLL0IN} = 20$ MHz (resonator)	$f_{PLL0PHI} = 400$ MHz, 6-sigma	—	—	200	ps
$ \Delta_{PLL0PHI1SPJ} $	CC	PLL0_PHI1 single period jitter <sup>3</sup> $f_{PLL0IN} = 20$ MHz (resonator)	$f_{PLL0PHI1} = 40$ MHz, 6-sigma	—	—	300 <sup>4</sup>	ps

Table 21. PLL0 electrical characteristics (continued)

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
$\Delta_{PLL0LTJ}$	CC	PLL0 output long term jitter <sup>3,4</sup> $f_{PLL0IN} = 20$ MHz (resonator), VCO frequency = 800 MHz	10 periods accumulated jitter (80 MHz equivalent frequency), 6-sigma pk-pk	—	—	$\pm 250$	ps
			16 periods accumulated jitter (50 MHz equivalent frequency), 6-sigma pk-pk	—	—	$\pm 300$	ps
			long term jitter ( $< 1$ MHz equivalent frequency), 6-sigma pk-pk)	—	—	$\pm 500$	ps
$I_{PLL0}$	CC	PLL0 consumption	FINE LOCK state	—	—	5	mA

<sup>1</sup>  $f_{PLL0IN}$  frequency must be scaled down using PLLDIG\_PLL0DV[PREDIV] to ensure PFD input signal is in the range 8 MHz–20 MHz.

<sup>2</sup> PLL0IN clock retrieved directly from either internal RCOSC or external XOSC clock. Input characteristics are granted when using internal RCOSC or external oscillator is used in functional mode.

<sup>3</sup> PLL jitter is guaranteed when transient currents on the  $V_{DDL V}$  supply are within the  $I_{SPIKE}$  parameter value in [Table 10 \(DC electrical specifications\)](#).

<sup>4</sup> Noise on the  $V_{DD\_LV}$  supply with frequency content below 40 KHz and above 50 MHz is filtered by the PLL. Noise on the  $V_{DD\_LV}$  supply with frequency content in the range of 40 KHz – 50 MHz must be filtered externally to the device.

Table 22. PLL1 electrical characteristics

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
$f_{PLL1IN}$	SR	PLL1 input clock <sup>1</sup>	—	38	—	78	MHz
$\Delta_{PLL1IN}$	SR	PLL1 input clock duty cycle <sup>1</sup>	—	35	—	65	%
$f_{PLL1VCO}$	CC	PLL1 VCO frequency	—	600	—	1250	MHz
$f_{PLL1VCOFR}$	CC	PLL1 VCO free running frequency	—	35	—	400	MHz
$f_{PLL1PHI}$	CC	PLL1 output clock PHI	—	4.762	—	600	MHz
$t_{PLL1LOCK}$	CC	PLL1 lock time	—	—	—	100	$\mu$ s
$f_{PLL1MOD}$	CC	PLL1 modulation frequency	—	—	—	250	kHz
$ \delta_{PLL1MOD} $	CC	PLL1 modulation depth (when enabled)	Center spread	0.25	—	2	%
			Down spread	0.5	—	4	%
$I_{PLL1}$	CC	PLL1 consumption	FINE LOCK state	—	—	6	mA

<sup>1</sup> PLL1IN clock retrieved directly from either internal PLL0 or external XOSC clock. Input characteristics are granted when using internal PLL0 or external oscillator is used in functional mode.

Table 23. External Oscillator electrical specifications<sup>1</sup>

Symbol		Parameter	Conditions	Value		Unit
				Min	Max	
f <sub>XTAL</sub>	CC	Crystal Frequency Range <sup>2</sup>	—	4	8	MHz
			—	>8	20	
			—	>20	40	
t <sub>cst</sub>	CC	Crystal start-up time <sup>3,4</sup>	T <sub>J</sub> = 150 °C	—	5	ms
t <sub>rec</sub>	CC	Crystal recovery time <sup>5</sup>	—	—	0.5	ms
V <sub>IHEXT</sub>	CC	EXTAL input high voltage <sup>6,7</sup> (External Clock Input)	V <sub>REF</sub> = 0.28 * V <sub>DD_HV_IO_JTAG</sub>	V <sub>REF</sub> + 0.6	—	V
V <sub>ILEXT</sub>	CC	EXTAL input low voltage <sup>6,7</sup> (External Clock Input)	V <sub>REF</sub> = 0.28 * V <sub>DD_HV_IO_JTAG</sub>	—	V <sub>REF</sub> - 0.6	V
C <sub>S_xtal</sub>	CC	Total on-chip stray capacitance on XTAL/EXTAL pins <sup>8</sup>	BGA416, BGA512	8	8.6	pF
V <sub>EXTAL</sub>	CC	Oscillation Amplitude on the EXTAL pin after startup <sup>9</sup>	T <sub>J</sub> = -40 °C to 150 °C	0.5	1.6	V
V <sub>HYS</sub>	CC	Comparator Hysteresis	T <sub>J</sub> = -40 °C to 150 °C	0.1	1.0	V
I <sub>XTAL</sub>	CC	XTAL current <sup>13,10</sup>	T <sub>J</sub> = -40 °C to 150 °C	—	14	mA

<sup>1</sup> All oscillator specifications are valid for VDD\_HV\_IO\_JTAG = 3.0 V – 5.5 V.

<sup>2</sup> The range is selectable by UTEST miscellaneous DCF clients XOSC\_LF\_EN and XOSC\_EN\_40MHZ.

<sup>3</sup> This value is determined by the crystal manufacturer and board design.

<sup>4</sup> Proper PC board layout procedures must be followed to achieve specifications.

<sup>5</sup> Crystal recovery time is the time for the oscillator to settle to the correct frequency after adjustment of the integrated load capacitor value.

<sup>6</sup> This parameter is guaranteed by design rather than 100% tested.

<sup>7</sup> Applies to an external clock input and not to crystal mode.

<sup>8</sup> See crystal manufacturer's specification for recommended load capacitor (C<sub>L</sub>) values. The external oscillator requires external load capacitors when operating from 8 MHz to 16 MHz. Account for on-chip stray capacitance (C<sub>S\_EXTAL</sub>/C<sub>S\_XTAL</sub>) and PCB capacitance when selecting a load capacitor value. When operating at 20 MHz/40 MHz, the integrated load capacitor value is selected via S/W to match the crystal manufacturer's specification, while accounting for on-chip and PCB capacitance.

<sup>9</sup> Amplitude on the EXTAL pin after startup is determined by the ALC block, i.e., the Automatic Level Control Circuit. The function of the ALC is to provide high drive current during oscillator startup, but reduce current after oscillation in order to reduce power, distortion, and RFI, and to avoid over-driving the crystal. The operating point of the ALC is dependent on the crystal value and loading conditions.

<sup>10</sup> I<sub>XTAL</sub> is the oscillator bias current out of the XTAL pin with both EXTAL and XTAL pins grounded. This is the maximum current during startup of the oscillator. The current after oscillation is typically in the 2–3 mA range and is dependent on the load and series resistance of the crystal. Test circuit is shown in [Figure 13](#).

Table 24. Selectable load capacitance

load_cap_sel[4:0] from DCF record	Load capacitance <sup>1,2</sup> (pF)
00000	1.032
00001	1.976
00010	2.898
00011	3.823
00100	4.751
00101	5.679
00110	6.605
00111	7.536
01000	8.460
01001	9.390
01010	10.317
01011	11.245
01100	12.173
01101	13.101
01110	14.029
01111	14.957

<sup>1</sup> Values are determined from simulation across process corners and voltage and temperature variation. Capacitance values vary  $\pm 12\%$  across process, 0.25% across voltage, and no variation across temperature.

<sup>2</sup> Values in this table do not include the die and package capacitances given by Cs\_xtal/Cs\_extal in [Table 23 \(External Oscillator electrical specifications\)](#).

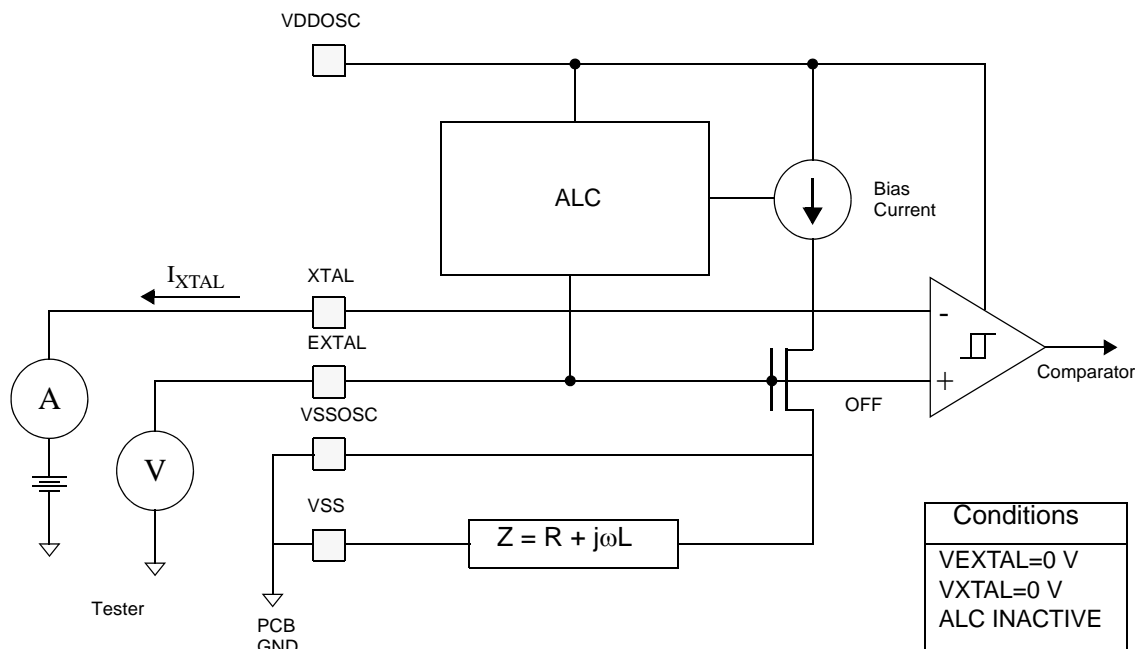

Figure 13. Test circuit

Table 25. Internal RC Oscillator electrical specifications

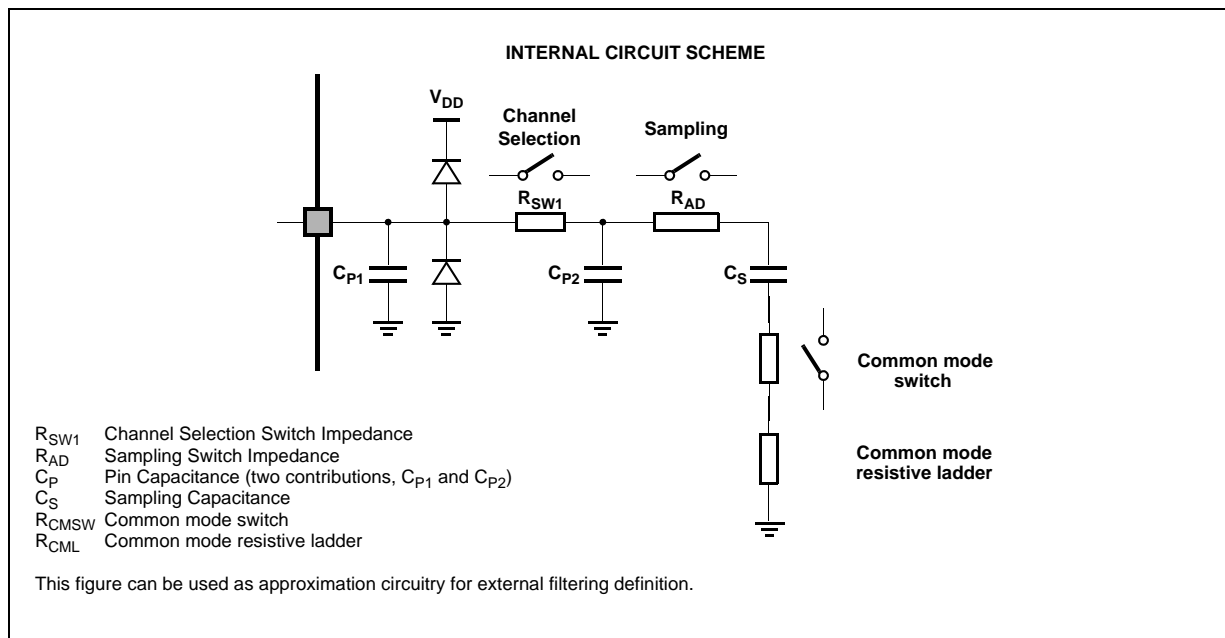

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
$f_{\text{Target}}$	CC	IRC target frequency	—	—	16	—	MHz
$\delta f_{\text{var\_noT}}$	CC	IRC frequency variation without temperature compensation	$T < 150\text{ }^{\circ}\text{C}$	-8	—	8	%
$\delta f_{\text{var\_T}}$	CC	IRC frequency variation with temperature compensation	$T < 150\text{ }^{\circ}\text{C}$	-3	—	3	%
$\delta f_{\text{var\_SW}}^1$	CC	IRC software trimming accuracy	Trimming temperature	-1	—	1	%
$\delta f_{\text{TPIM}}$		IRC Software trimming step	—	-48	—	+40	kHz
$T_{\text{start\_noT}}$	CC	Startup time to reach within $f_{\text{var\_noT}}$	No trimming	—	—	5	$\mu\text{s}$
$T_{\text{start\_T}}$	CC	Startup time to reach within $f_{\text{var\_T}}$	Factory trimming already applied	—	—	120	$\mu\text{s}$
$I_{\text{AVDD5}}$	CC	Current consumption on 5 V power supply	After $T_{\text{start\_T}}$	—	—	400	$\mu\text{A}$
$I_{\text{DVDD12}}$	CC	Current consumption on 1.2 V power supply	After $T_{\text{start\_T}}$	—	—	175	$\mu\text{A}$

<sup>1</sup> IRC software trimmed accuracy is performed either with the CMU\_0 clock monitor, using the XOSC as a reference or through the CCCU (CAN clock control Unit), extracting reference clock from CAN master clock. Software trim must be repeated as the device operating temperature varies in order to maintain the specified accuracy.

## 3.10 ADC specifications

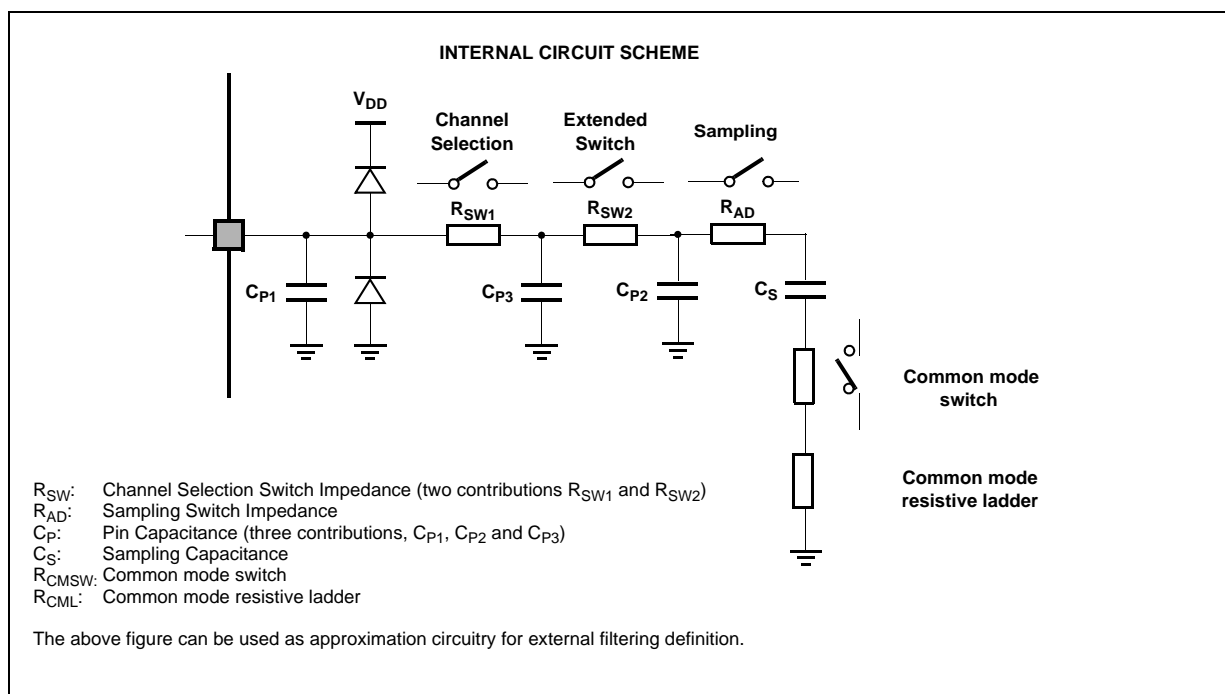

### 3.10.1 ADC input description

Figure 14 shows the input equivalent circuit for fast SARn channels.

**Figure 14. Input equivalent circuit (Fast SARn channels)**

Figure 15 shows the input equivalent circuit for SARB channels.

**Figure 15. Input equivalent circuit (SARB channels)**

Table 26. ADC pin specification<sup>1</sup>

Symbol		Parameter	Conditions	Value		Unit
				Min	Max	
I <sub>LK_INUD</sub>	CC	Input leakage current, two ADC channels input with weak pull-up and weak pull-down	T <sub>J</sub> < 40 °C	—	50	nA
			T <sub>J</sub> < 150 °C	—	150	
I <sub>LK_INUSD</sub>	CC	Input leakage current, two ADC channels input with weak pull-up and strong pull-down	T <sub>J</sub> < 40 °C	—	80	nA
			T <sub>J</sub> < 150 °C	—	250	
I <sub>LK_INREF</sub>	CC	Input leakage current, two ADC channels input with weak pull-up and weak pull-down and alternate reference	T <sub>J</sub> < 40 °C	—	160	nA
			T <sub>J</sub> < 150 °C	—	400	
I <sub>LK_INOUT</sub>	CC	Input leakage current, two ADC channels input, GPIO output buffer with weak pull-up and weak pull-down	T <sub>J</sub> < 40 °C	—	140	nA
			T <sub>J</sub> < 150 °C	—	380	
I <sub>INJ</sub>	CC	Injection current on analog input preserving functionality	Applies to any analog pins	–3	3	mA
C <sub>HV_ADC</sub>	SR	V <sub>DD_HV_ADV</sub> external capacitance <sup>2</sup>		1	2.2	μF
C <sub>P1</sub>	CC	Pad capacitance	—	0	10	pF
C <sub>P2</sub>	CC	Internal routing capacitance	SARn channels	0	0.5	pF
			SARB channels	0	1	
C <sub>P3</sub>	CC	Internal routing capacitance	Only for SARB channels	0	1	pF
C <sub>S</sub>	CC	SAR ADC sampling capacitance	—	6	8.5	pF
R <sub>SWn</sub>	CC	Analog switches resistance	SARn channels	0	1.1	kΩ
			SARB channels	0	1.7	
R <sub>AD</sub>	CC	ADC input analog switches resistance	—	0	0.6	kΩ
R <sub>CMSW</sub>	CC	Common mode switch resistance	—	0	2.6	kΩ
R <sub>CMRL</sub>	CC	Common mode resistive ladder	—	0	3.5	kΩ
R <sub>SAFE PD</sub> <sup>3</sup>	CC	Discharge resistance for AN7/AN35 channels (strong pull-down for safety)	—	0	300	Ω

<sup>1</sup> All specifications in this table valid for the full input voltage range for the analog inputs.

<sup>2</sup> For noise filtering, add a high frequency bypass capacitance of 0.1 μF between V<sub>DD\_HV\_ADV</sub> and V<sub>SS\_HV\_ADV</sub>.

<sup>3</sup> Safety pull-down is available for port pin PB[5] and PE[14].

### 3.10.2 SAR ADC electrical specification

The SARn ADCs are 12-bit Successive Approximation Register analog-to-digital converters with full capacitive DAC. The SARn architecture allows input channel multiplexing.

Table 27. SARN ADC electrical specification<sup>1</sup>

Symbol		Parameter	Conditions	Value		Unit
				Min	Max	
V <sub>ALTREF</sub>	SR	ADC alternate reference voltage	V <sub>ALTREF</sub> < V <sub>DD_HV_IO_MAIN</sub>	2.0	V <sub>DD_HV_ADV_S</sub>	V
V <sub>IN</sub>	SR	ADC input signal	0 < V <sub>IN</sub> < V <sub>DD_HV_IO_MAIN</sub>	V <sub>SS_HV_ADR_S</sub>	V <sub>DD_HV_ADR_S</sub>	V
f <sub>ADCK</sub>	SR	Clock frequency	T <sub>J</sub> < 150 °C	7.5	14.6	MHz
t <sub>ADCPRECH</sub>	SR	ADC precharge time	Fast SAR—fast precharge	135	—	ns
			Fast SAR—full precharge	270	—	
			Slow SAR (SARADC_B)—fast precharge	270	—	
			Slow SAR (SARADC_B)—full precharge	540	—	
ΔV <sub>PRECH</sub>	SR	Precharge voltage precision	Full precharge V <sub>PRECH</sub> = V <sub>DD_HV_ADR_S</sub> /2 T <sub>J</sub> < 150 °C	–0.25	0.25	V
			Fast precharge V <sub>PRECH</sub> = V <sub>DD_HV_ADR_S</sub> /2 T <sub>J</sub> < 150 °C	–0.5	0.5	V
ΔV <sub>INTREF</sub>	CC	Internal reference voltage precision	Applies to all internal reference points (V <sub>SS_HV_ADR_S</sub> , 1/3 * V <sub>DD_HV_ADR_S</sub> , 2/3 * V <sub>DD_HV_ADR_S</sub> , V <sub>DD_HV_ADR_S</sub> )	–0.20	0.20	V
t <sub>ADCSAMPLE</sub>	SR	ADC sample time <sup>2</sup>	Fast SAR – 12-bit configuration	0.750	—	μs
			Slow SAR (SARADC_B) – 12-bit configuration	1.500	—	
t <sub>ADCEVAL</sub>	SR	ADC evaluation time	12-bit configuration (25 clock cycles)	1.712	—	μs
I <sub>ADCREFH</sub> <sup>3,4</sup>	CC	ADC high reference current	Run mode t <sub>conv</sub> ≥ 5 μs (average across all codes)	—	7	μA
			Run mode t <sub>conv</sub> = 2.5 μs (average across all codes)	—	7	
			Power Down mode	—	6	
			Bias Current <sup>5</sup>	—	+2	
I <sub>ADCREFL</sub> <sup>4</sup>	CC	ADC low reference current	Run mode t <sub>conv</sub> ≥ 5 μs V <sub>DD_HV_ADR_S</sub> ≤ 5.5 V	—	15	μA
			Run mode t <sub>conv</sub> = 2.5 μs V <sub>DD_HV_ADR_S</sub> ≤ 5.5 V	—	30	
			Power Down mode V <sub>DD_HV_ADR_S</sub> ≤ 5.5 V	—	1	

Table 27. SARn ADC electrical specification<sup>1</sup> (continued)

Symbol		Parameter	Conditions	Value		Unit
				Min	Max	
$I_{ADV\_S}$ <sup>4</sup>	CC	$V_{DD\_HV\_ADV\_S}$ power supply current (each ADC)	Run mode $t_{conv} \geq 5 \mu s$	—	4.0	mA
			Run mode $t_{conv} = 2.5 \mu s$	—	4.0	
			Power Down mode	—	1.0	
TUE <sub>12</sub>	CC	Total unadjusted error in 12-bit configuration <sup>6</sup>	$T_J < 150\text{ }^{\circ}\text{C}$ , $V_{DD\_HV\_ADV\_S} > 4\text{ V}$ , $V_{DD\_HV\_ADR\_S} > 4\text{ V}$	−4	4	LSB (12b)
			$T_J < 150\text{ }^{\circ}\text{C}$ , $V_{DD\_HV\_ADV\_S} > 4\text{ V}$ , $4\text{ V} > V_{DD\_HV\_ADR\_S} > 2\text{ V}$	−6	6	
			$T_J < 150\text{ }^{\circ}\text{C}$ , $4\text{ V} > V_{DD\_HV\_ADV\_S} > 3.5\text{ V}$	−12	12

Symbol		Parameter	Conditions	Value		Unit
				Min	Max	
$\Delta TUE_{12}$	CC	TUE degradation due to $V_{DD\_HV\_ADR\_S}$ offset with respect to $V_{DD\_HV\_ADV\_S}$	$V_{IN} < V_{DD\_HV\_ADV\_S}$ $V_{DD\_HV\_ADR\_S} - V_{DD\_HV\_ADV\_S} \in [0:25 \text{ mV}]$	0	0	LSB (12b)
			$V_{IN} < V_{DD\_HV\_ADV\_S}$ $V_{DD\_HV\_ADR\_S} - V_{DD\_HV\_ADV\_S} \in [25:50 \text{ mV}]$	-2	2	
			$V_{IN} < V_{DD\_HV\_ADV\_S}$ $V_{DD\_HV\_ADR\_S} - V_{DD\_HV\_ADV\_S} \in [50:75 \text{ mV}]$	-4	4	
			$V_{IN} < V_{DD\_HV\_ADV\_S}$ $V_{DD\_HV\_ADR\_S} - V_{DD\_HV\_ADV\_S} \in [75:100 \text{ mV}]$	-6	6	
			$V_{DD\_HV\_ADV\_S} < V_{IN} < V_{DD\_HV\_ADR\_S}$ $V_{DD\_HV\_ADR\_S} - V_{DD\_HV\_ADV\_S} \in [0:25 \text{ mV}]$	-2.5	2.5	
			$V_{DD\_HV\_ADV\_S} < V_{IN} < V_{DD\_HV\_ADR\_S}$ $V_{DD\_HV\_ADR\_S} - V_{DD\_HV\_ADV\_S} \in [25:50 \text{ mV}]$	-4	4	
			$V_{DD\_HV\_ADV\_S} < V_{IN} < V_{DD\_HV\_ADR\_S}$ $V_{DD\_HV\_ADR\_S} - V_{DD\_HV\_ADV\_S} \in [50:75 \text{ mV}]$	-7	7	
			$V_{DD\_HV\_ADV\_S} < V_{IN} < V_{DD\_HV\_ADR\_S}$ $V_{DD\_HV\_ADR\_S} - V_{DD\_HV\_ADV\_S} \in [75:100 \text{ mV}]$	-12	12	
DNL	CC	Differential non-linearity	$V_{DD\_HV\_ADV\_S} > 4 \text{ V}$ $V_{DD\_HV\_ADR\_S} > 4 \text{ V}$	-1	2	LSB (12b)
INL	CC	Integral non-linearity	$4.0 \text{ V} < V_{DD\_HV\_ADV\_S} < 5.5 \text{ V}$ $4.0 \text{ V} < V_{DD\_HV\_ADR\_S} < 5.5 \text{ V}$	-3	3	LSB (12b)
			$V_{DD\_HV\_ADV\_S} = 2 \text{ V}$ $V_{DD\_HV\_ADR\_S} = 2 \text{ V}$	-5	5	

<sup>1</sup> Functional operating conditions are given in the DC electrical specifications. Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the listed maxima may affect device reliability or cause permanent damage to the device.

<sup>2</sup> Minimum ADC sample times are dependent on adequate charge transfer from the external driving circuit to the internal sample capacitor. The time constant of the entire circuit must allow the sampling capacitor to charge within 1/2 LSB within the sampling window. Please refer to Figure 14 and Figure 15 for models of the internal ADC circuit, and the values to use in external RC sizing and calculating the sampling window duration.

<sup>3</sup>  $I_{ADCREFL}$  and  $I_{ADCREFL}$  are independent from ADC clock frequency. It depends on conversion rate: consumption is driven by the transfer of charge between internal capacitances during the conversion.

<sup>4</sup> Current parameter values are for a single ADC.

<sup>5</sup> Extra bias current is present only when BIAS is selected.

<sup>6</sup> This parameter is guaranteed by bench validation with a small sample of typical devices, and tested in production to  $\pm 6$  LSB.

### 3.10.3 S/D ADC electrical specification

The SDn ADCs are Sigma Delta 16-bit analog-to-digital converters with 333 Ksps maximum output rate.

**Table 28. SDn ADC electrical specification<sup>1</sup>**

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
V <sub>IN</sub>	SR	ADC input signal	—	0	—	V <sub>DD_HV_ADV_D</sub>	V

<sup>1</sup> Functional operating conditions are given in the DC electrical specifications. Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the listed maxima may affect device reliability or cause permanent damage to the device.

<sup>2</sup> For input voltage above the maximum and below the clamp voltage of the input pad, there is no latch-up concern, and the signal will only be 'clipped'.

<sup>3</sup> V<sub>INP</sub> is the input voltage applied to the positive terminal of the SDADC.

<sup>4</sup> V<sub>INM</sub> is the input voltage applied to the negative terminal of the SDADC.

<sup>5</sup> When using a GAIN setting of 16, the conversion result will always have a value of zero in the least significant bit. The gives an effective resolution of 15 bits.

<sup>6</sup> Offset and gain error due to temperature drift can occur in either direction (+/-) for each of the SDADCs on the device.

<sup>7</sup> Calibration of gain is possible when gain = 1.

Offset Calibration should be done with respect to  $0.5 \times V_{DD\_HV\_ADR\_D}$  for *differential mode* and *single ended mode with negative input* =  $0.5 \times V_{DD\_HV\_ADR\_D}$ .

Offset Calibration should be done with respect to 0 for "single ended mode with negative input=0".

Both offset and Gain Calibration is guaranteed for  $\pm 5\%$  variation of V<sub>DD\_HV\_ADR\_D</sub>,  $\pm 10\%$  variation of V<sub>DD\_HV\_ADV\_D</sub>, and  $\pm 50$  °C temperature variation.

<sup>8</sup> Conversion offset error must be divided by the applied gain factor (1, 2, 4, 8, or 16) to obtain the actual input referred offset error.

<sup>9</sup> S/D ADC is functional in the range 3.6 V – 4.5 V, SNR parameter degrades by 3 dB. Degraded SNR value based on simulation.

<sup>10</sup> S/D ADC is functional in the range 3.0 V – 4.5 V, SNR parameter degrades by 9 dB. Degraded SNR value based on simulation.

<sup>11</sup> This parameter is guaranteed by bench validation with a small sample of typical devices, and tested in production to a value of 6 dB less.

<sup>12</sup> Input impedance in differential mode Z<sub>IN</sub>(input impedance) = Z<sub>DIFF</sub>.

## Electrical characteristics

- <sup>13</sup> Impedance given at  $F_{\text{ADCD\_M}} = 16 \text{ MHz}$ . Impedance is inversely proportional to SDADC clock frequency.  
 $Z_{\text{DIFF}}(F_{\text{ADCD\_M}}) = (16 \text{ MHz} / F_{\text{ADCD\_M}}) * Z_{\text{DIFF}}$ ,  $Z_{\text{CM}}(F_{\text{ADCD\_M}}) = (16 \text{ MHz} / F_{\text{ADCD\_M}}) * Z_{\text{CM}}$ .
- <sup>14</sup> Input impedance in single-ended mode  $Z_{\text{IN}} = (2 * Z_{\text{DIFF}} * Z_{\text{CM}}) / (Z_{\text{DIFF}} + Z_{\text{CM}})$ .
- <sup>15</sup> Impedance given at  $F_{\text{ADCD\_M}} = 16 \text{ MHz}$ . Impedance is inversely proportional to SDADC clock frequency.  
 $Z_{\text{DIFF}}(F_{\text{ADCD\_M}}) = (16 \text{ MHz} / F_{\text{ADCD\_M}}) * Z_{\text{DIFF}}$ ,  $Z_{\text{CM}}(F_{\text{ADCD\_M}}) = (16 \text{ MHz} / F_{\text{ADCD\_M}}) * Z_{\text{CM}}$ .
- <sup>16</sup>  $V_{\text{intcm}}$  is the common mode input reference voltage for the SDADC, and has a nominal value of  $(V_{\text{DD\_HV\_ADC}} - V_{\text{SS\_HV\_ADC}}) / 2$ .
- <sup>17</sup> SNR values guaranteed only if external noise on the ADC input pin is attenuated by the required SNR value in the frequency range of  $f_{\text{ADCD\_M}} - f_{\text{ADCD\_S}}$  to  $f_{\text{ADCD\_M}} + f_{\text{ADCD\_S}}$ , where  $f_{\text{ADCD\_M}}$  is the input sampling frequency, and  $f_{\text{ADCD\_S}}$  is the output sample frequency. A proper external input filter should be used to remove any interfering signals in this frequency range.
- <sup>18</sup> The  $\pm 1\%$  passband ripple specification is equivalent to  $20 * \log_{10}(0.99) = 0.087 \text{ dB}$ .
- <sup>19</sup> Propagation of the information from the pin to the register CDR[CDATA] and flags SFR[DFF], SFR[DFFF] is given by the different modules that need to be crossed: delta/sigma filters, high pass filter, fifo module, clock domain synchronizers. The time elapsed between data availability at pin and internal S/D module registers is given by the below formula:
- $$\text{REGISTER LATENCY} = t_{\text{LATENCY}} + 0.5/f_{\text{ADCD\_S}} + 2(\sim +1)/f_{\text{ADCD\_M}} + 2(\sim +1)f_{\text{PBRIDGE\_CLK}}$$
- where  $f_{\text{ADCD\_S}}$  is the frequency of the sampling clock,  $f_{\text{ADCD\_M}}$  is the frequency of the modulator, and  $f_{\text{PBRIDGE\_CLK}}$  is the frequency of the peripheral bridge clock feeds to the ADC S/D module. The  $(\sim +1)$  symbol refers to the number of clock cycles uncertainty (from 0 to 1 clock cycle) to be added due to resynchronization of the signal during clock domain crossing.
- Some further latency may be added by the target module (core, DMA, interrupt) controller to process the data received from the ADC S/D module.
- <sup>20</sup> This capacitance does not include pin capacitance, that can be considered together with external capacitance, before sampling switch.

## 3.11 Temperature sensor

The following table describes the temperature sensor electrical characteristics.

**Table 29. Temperature sensor electrical characteristics**

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
—	CC	Temperature monitoring range	—	−40	—	150	°C
$T_{\text{SENS}}$	CC	Sensitivity	—	—	5.18	—	mV/°C
$T_{\text{ACC}}$	CC	Accuracy	$T_{\text{J}} < 150 \text{ °C}$	−3	—	3	°C
$I_{\text{TEMP\_SENS}}$	CC	$V_{\text{DD\_HV\_ADV\_S}}$ power supply current	—	—	—	700	μA

## 3.12 LVDS Fast Asynchronous Serial Transmission (LFAST) pad electrical characteristics

The LFAST pad electrical characteristics apply to both the SIPI and high-speed debug serial interfaces on the device. The same LVDS pad is used for the Microsecond Channel (MSC) and DSPI LVDS interfaces, with different characteristics given in the following tables.

### 3.12.1 LFAST interface timing diagrams

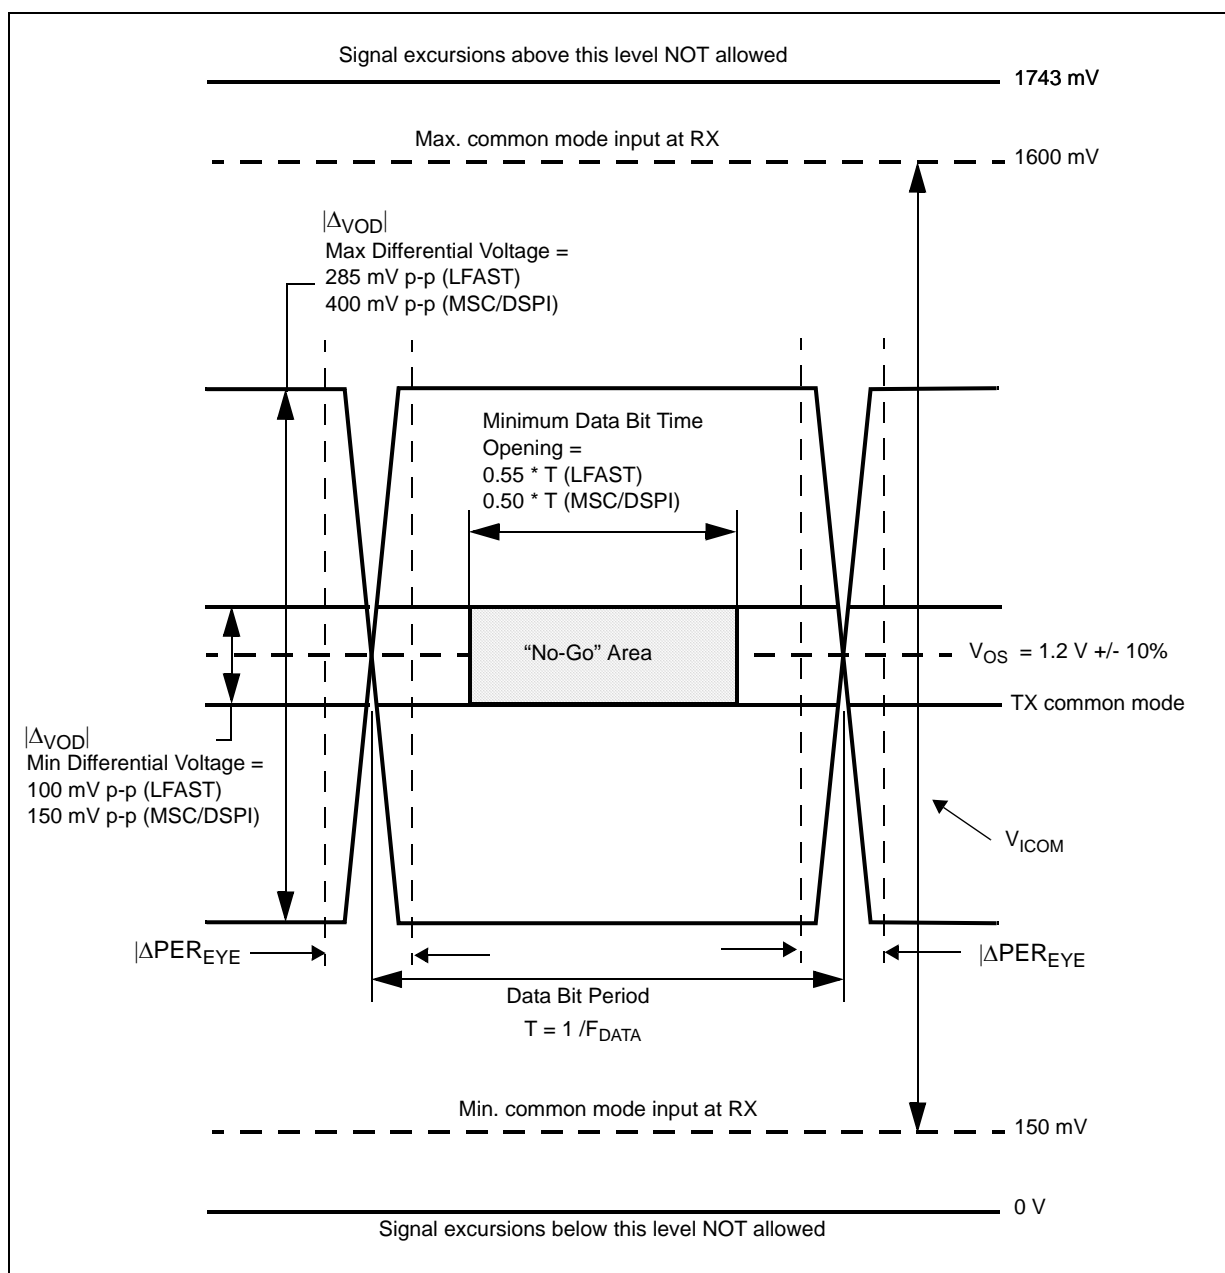

Figure 16. LFAST and MSC/DSPI LVDS timing definition

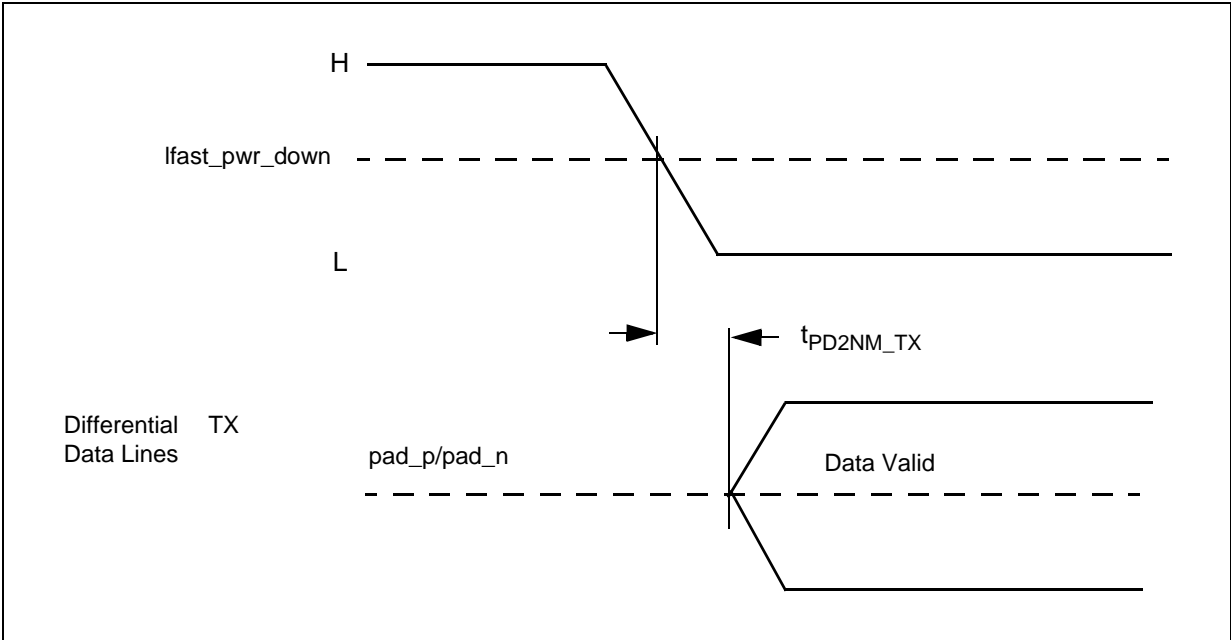

Figure 17. Power-down exit time

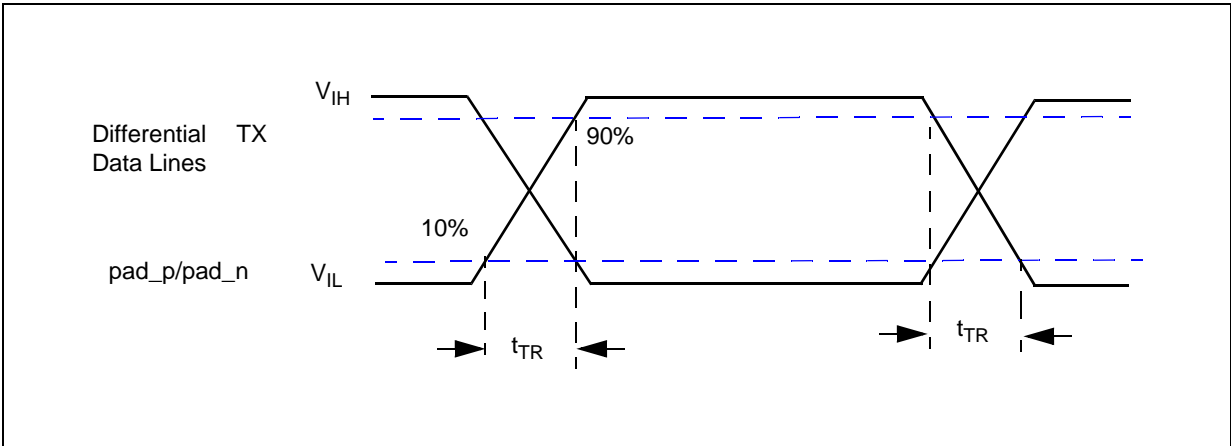

Figure 18. Rise/fall time

3.12.2 LFAST and MSC/DSPI LVDS interface electrical characteristics

The following table contains the electrical characteristics for the LFAST interface.

Table 30. LVDS pad startup and receiver electrical characteristics<sup>1,2</sup>

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
STARTUP <sup>3,4</sup>							
t <sub>STRT_BIAS</sub>	CC	Bias current reference startup time <sup>5</sup>	—	—	0.5	4	μs
t <sub>PD2NM_TX</sub>	CC	Transmitter startup time (power down to normal mode) <sup>6</sup>	—	—	0.4	2.75	μs

Table 30. LVDS pad startup and receiver electrical characteristics<sup>1,2</sup> (continued)

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
$t_{SM2NM\_TX}$	CC	Transmitter startup time (sleep mode to normal mode) <sup>7</sup>	Not applicable to the MSC/DSPI LVDS pad	—	0.2	0.5	μs
$t_{PD2NM\_RX}$	CC	Receiver startup time (power down to normal mode) <sup>8</sup>	—	—	20	40	ns
$t_{PD2SM\_RX}$	CC	Receiver startup time (power down to sleep mode) <sup>9</sup>	Not applicable to the MSC/DSPI LVDS pad	—	20	50	ns
$I_{LVDS\_BIAS}$	CC	LVDS bias current consumption	Tx or Rx enabled	—	—	0.95	mA
<b>TRANSMISSION LINE CHARACTERISTICS (PCB Track)</b>							
$Z_0$	SR	Transmission line characteristic impedance	—	47.5	50	52.5	Ω
$Z_{DIFF}$	SR	Transmission line differential impedance	—	95	100	105	Ω
<b>RECEIVER</b>							
$V_{ICOM}$	SR	Common mode voltage	—	0.15 <sup>10</sup>	—	1.6 <sup>11</sup>	V
$ \Delta_{VIL} $	SR	Differential input voltage <sup>12</sup>	—	100	—	—	mV
$V_{HYS}$	CC	Input hysteresis	—	25	—	—	mV
$R_{IN}$	CC	Terminating resistance	3.0 V–5.5 V	80	125	150	Ω
$C_{IN}$	CC	Differential input capacitance <sup>13</sup>	—	—	3.5	6.0	pF
$I_{LVDS\_RX}$	CC	Receiver DC current consumption	Enabled	—	—	0.5	mA

<sup>1</sup> The LVDS pad startup and receiver electrical characteristics in this table apply to both the LFAST & High-speed Debug (HSD) LVDS pad, and the MSC/DSPI LVDS pad except where noted in the conditions.

<sup>2</sup> All LVDS pad electrical characteristics are valid from –40 °C to 150 °C.

<sup>3</sup> All startup times are defined after a 2 peripheral bridge clock delay from writing to the corresponding enable bit in the LVDS control registers (LCR) of the LFAST and High-Speed Debug modules. The value of the LCR bits for the LFAST/HSD modules don't take effect until the corresponding SIUL2 MSCR ODC bits are set to LFAST LVDS mode. Startup times for MSC/DSPI LVDS are defined after 2 peripheral bridge clock delay after selecting MSC/DSPI LVDS in the corresponding SIUL2 MSCR ODC field.

<sup>4</sup> Startup times are valid for the maximum external loads CL defined in both the LFAST/HSD and MSC/DSPI transmitter electrical characteristic tables.

<sup>5</sup> Bias startup time is defined as the time taken by the current reference block to reach the settling bias current after being enabled.

<sup>6</sup> Total transmitter startup time from power down to normal mode is  $t_{STRT\_BIAS} + t_{PD2NM\_TX} + 2$  peripheral bridge clock periods.

<sup>7</sup> Total transmitter startup time from sleep mode to normal mode is  $t_{SM2NM\_TX} + 2$  peripheral bridge clock periods. Bias block remains enabled in sleep mode.

<sup>8</sup> Total receiver startup time from power down to normal mode is  $t_{STRT\_BIAS} + t_{PD2NM\_RX} + 2$  peripheral bridge clock periods.

<sup>9</sup> Total receiver startup time from power down to sleep mode is  $t_{PD2SM\_RX} + 2$  peripheral bridge clock periods. Bias block remains enabled in sleep mode.

<sup>10</sup> Absolute min =  $0.15\text{ V} - (285\text{ mV}/2) = 0\text{ V}$

<sup>11</sup> Absolute max =  $1.6\text{ V} + (285\text{ mV}/2) = 1.743\text{ V}$

## Electrical characteristics

<sup>12</sup> The LXRXP[0] bit in the LFAST LVDS Control Register (LCR) must be set to one to ensure proper LFAST receive timing.

<sup>13</sup> Total internal capacitance including receiver and termination, co-bonded GPIO pads, and package contributions.

**Table 31. LFAST transmitter electrical characteristics<sup>1,2</sup>**

Symbol	Parameter	Conditions	Value			Unit
			Min	Typ	Max	
f <sub>DATA</sub>	SR	Data rate	—	—	312/320 <sup>3</sup>	Mbps
V <sub>OS</sub>	CC	Common mode voltage	1.08	—	1.32	V
V <sub>OD</sub>	CC	Differential output voltage swing (terminated) <sup>4,5</sup>	110	171	285	mV
t <sub>TR</sub>	CC	Rise/Fall time (absolute value of the differential output voltage swing) <sup>4,5</sup>	0.26	—	1.5	ns
C <sub>L</sub>	SR	External lumped differential load capacitance <sup>3</sup>	V <sub>DD_HV_IO</sub> = 4.5 V	—	10.0	pF
			V <sub>DD_HV_IO</sub> = 3.0 V	—	8.5	
I <sub>LVDS_TX</sub>	CC	Transmitter DC current consumption	Enabled	—	3.2	mA

<sup>1</sup> The LFAST and High-Speed Debug LFAST pad electrical characteristics are based on worst case internal capacitance values shown in [Figure 19](#).

<sup>2</sup> All LFAST and High-Speed Debug LVDS pad electrical characteristics are valid from –40 °C to 150 °C.

<sup>3</sup> The 312 Mbps data rate is achieved with a 26 MHz reference clock, and 320 Mbps is achieved with a 10 or 20 MHz reference clock.

<sup>4</sup> Valid for maximum data rate f<sub>DATA</sub>. Value given is the capacitance on each terminal of the differential pair, as shown in [Figure 19](#).

<sup>5</sup> Valid for maximum external load C<sub>L</sub>.

**Table 32. MSC/DSPI LVDS transmitter electrical characteristics<sup>1,2</sup>**

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
Data Rate							
f <sub>DATA</sub>	SR	Data rate	—	—	—	80	Mbps
V <sub>OS</sub>	CC	Common mode voltage	—	1.08	—	1.32	V
V <sub>OD</sub>	CC	Differential output voltage swing (terminated) <sup>3,4</sup>	—	150	214	400	mV
t <sub>TR</sub>	CC	Rise/Fall time (absolute value of the differential output voltage swing) <sup>3,4</sup>	—	0.8	—	4.0	ns
C <sub>L</sub>	SR	External lumped differential load capacitance <sup>3</sup>	V <sub>DD_HV_IO</sub> = 4.5 V	—	—	50	pF
			V <sub>DD_HV_IO</sub> = 3.0 V	—	—	39	
I <sub>LVDS_TX</sub>	CC	Transmitter DC current consumption	Enabled	—	—	4.0	mA

<sup>1</sup> The MSC and DSPI LVDS pad electrical characteristics are based on the application circuit and typical worst case internal capacitance values given in [Figure 19](#).

<sup>2</sup> All MSC and DSPI LVDS pad electrical characteristics are valid from –40 °C to 150 °C.

- <sup>3</sup> Valid for maximum data rate  $f_{\text{DATA}}$ . Value given is the capacitance on each terminal of the differential pair, as shown in Figure 19.
- <sup>4</sup> Valid for maximum external load  $C_L$ .

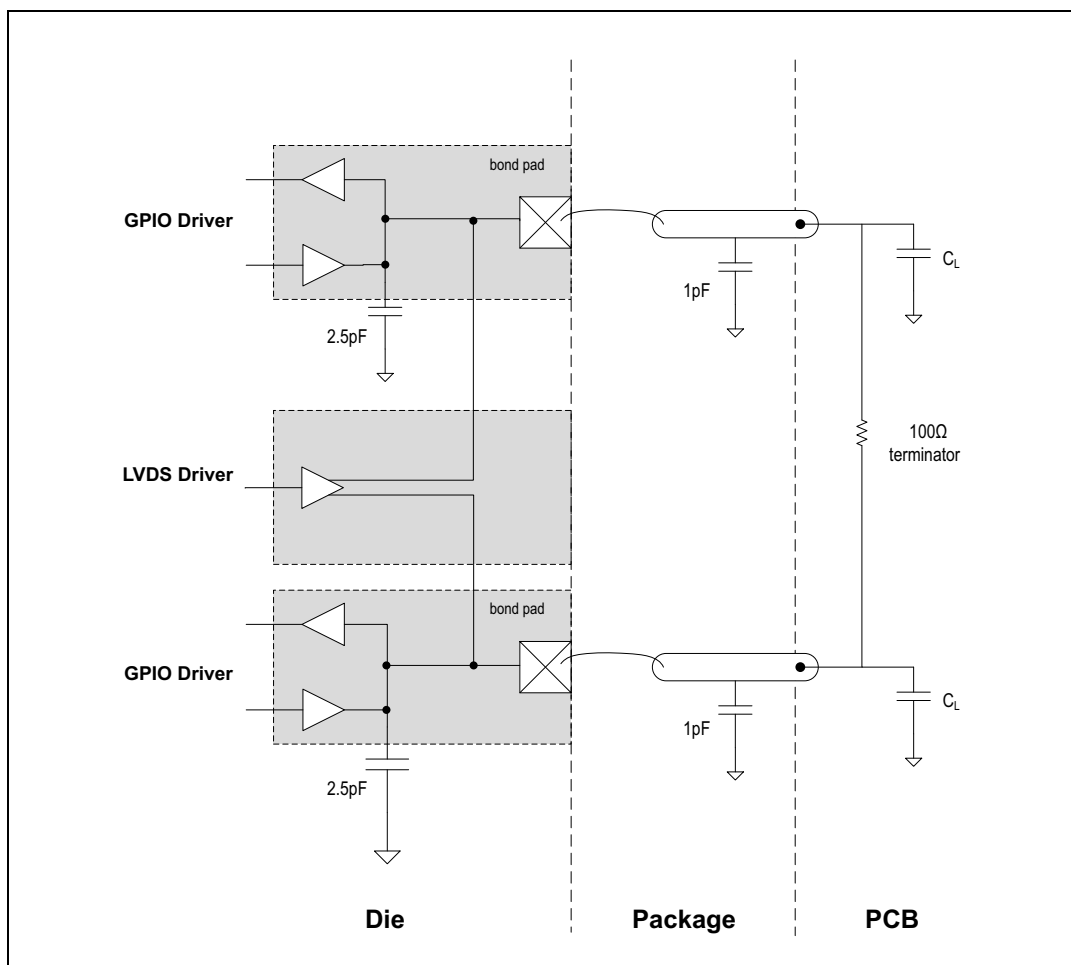

Figure 19. LVDS pad external load diagram

### 3.12.3 LFAST PLL electrical characteristics

The following table contains the electrical characteristics for the LFAST PLL.

Table 33. LFAST PLL electrical characteristics<sup>1</sup>

Symbol	Parameter	Conditions	Value			Unit
			Min	Nominal	Max	
$f_{\text{RF\_REF}}$	SR PLL reference clock frequency	—	10	—	26	MHz
$\text{ERR}_{\text{REF}}$	CC PLL input reference clock frequency error	—	−1	—	1	%
$\text{DC}_{\text{REF}}$	CC PLL input reference clock duty cycle	—	45	—	55	%
PN	CC Integrated phase noise (single side band)	$f_{\text{RF\_REF}} = 20 \text{ MHz}$	—	—	−58	dBc
		$f_{\text{RF\_REF}} = 10 \text{ MHz}$	—	—	−64	

Table 33. LFAST PLL electrical characteristics<sup>1</sup> (continued)

Symbol	Parameter	Conditions	Value			Unit
			Min	Nominal	Max	
$f_{VCO}$	CC	PLL VCO frequency	—	640 <sup>2</sup>	—	MHz
$t_{LOCK}$	CC	PLL phase lock <sup>3</sup>	—	—	40	μs
$\Delta PER_{REF}$	SR	Input reference clock jitter (peak to peak)	Single period, $f_{RF\_REF} = 10$ MHz	—	300	ps
		Long term, $f_{RF\_REF} = 10$ MHz				ps
$\Delta PER_{EYE}$	CC	Output Eye Jitter (peak to peak) <sup>4</sup>	—	—	400	ps

<sup>1</sup> The specifications in this table apply to both the interprocessor bus and debug LFAST interfaces.

<sup>2</sup> The 640 MHz frequency is achieved with a 10 MHz or 20 MHz reference clock. With a 26 MHz reference, the VCO frequency is 624 MHz.

<sup>3</sup> The time from the PLL enable bit register write to the start of phase locks is maximum 2 clock cycles of the peripheral bridge clock that is connected to the PLL on the device.

<sup>4</sup> Measured at the transmitter output across a 100 Ohm termination resistor on a device evaluation board. See Figure 19.

### 3.13 Aurora LVDS electrical characteristics

The following table describes the Aurora LVDS electrical characteristics.

#### NOTE

The Aurora interface is AC coupled, so there is no common-mode voltage specification.

Table 34. Aurora LVDS electrical characteristics<sup>1,2</sup>

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
Transmitter							
F <sub>TX</sub>	CC	Transmit Data Rate	—	—	—	1.25	Gbps
ΔV <sub>OD_LVDS</sub>	CC	Differential output voltage swing (terminated) <sup>3</sup>	—	±400	±600	±800	mV
t <sub>TR_LVDS</sub>	CC	Rise/Fall time (10%–90% of swing)	—	60	—	—	ps
R <sub>V_L_Tx</sub>	SR	Differential Terminating resistance	—	81	100	120	Ω
T <sub>Loss</sub>	CC	Transmission Line Loss due to loading effects	—	—	—	6 <sup>4</sup>	dB
Transmission line characteristics (PCB track)							
L <sub>LINE</sub>	SR	Transmission line length	—	—	—	20	cm
Z <sub>LINE</sub>	SR	Transmission line characteristic impedance	—	45	50	55	Ω
C <sub>ac_clk</sub>	SR	Clock Receive Pin External AC Coupling Capacitance	Values are nominal, valid for +/– 50% tolerance	100	—	270	pF

Table 34. Aurora LVDS electrical characteristics<sup>1,2</sup> (continued)

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
$C_{ac\_tx}$	SR	Transmit Lane External AC Coupling Capacitance	Values are nominal, valid for +/- 50% tolerance	250	—	2000	pF
<b>Receiver</b>							
$F_{RX}$	CC	Receive Clock Rate	$T_J = 150\text{ }^{\circ}\text{C}$	—	—	1.25	Gbps
$ \Delta V_{I\_L} $	SR	Differential input voltage (peak to peak)	—	200	—	1000	mV
$R_{V\_L\_Rx}$	CC	Differential Terminating resistance	—	81	100	120	$\Omega$

<sup>1</sup> All Aurora electrical characteristics are valid from  $-40\text{ }^{\circ}\text{C}$  to  $150\text{ }^{\circ}\text{C}$ , except where noted.

<sup>2</sup> All specifications valid for maximum transmit data rate  $F_{TX}$ .

<sup>3</sup> The minimum value of 400 mV is only valid for differential terminating resistance ( $R_{V\_L}$ ) = 99 ohm to 101 ohm. The differential output voltage swing tracks with the value of  $R_{V\_L}$ .

<sup>4</sup> Transmission line loss maximum value is specified for the maximum drive level of the Aurora transmit pad.

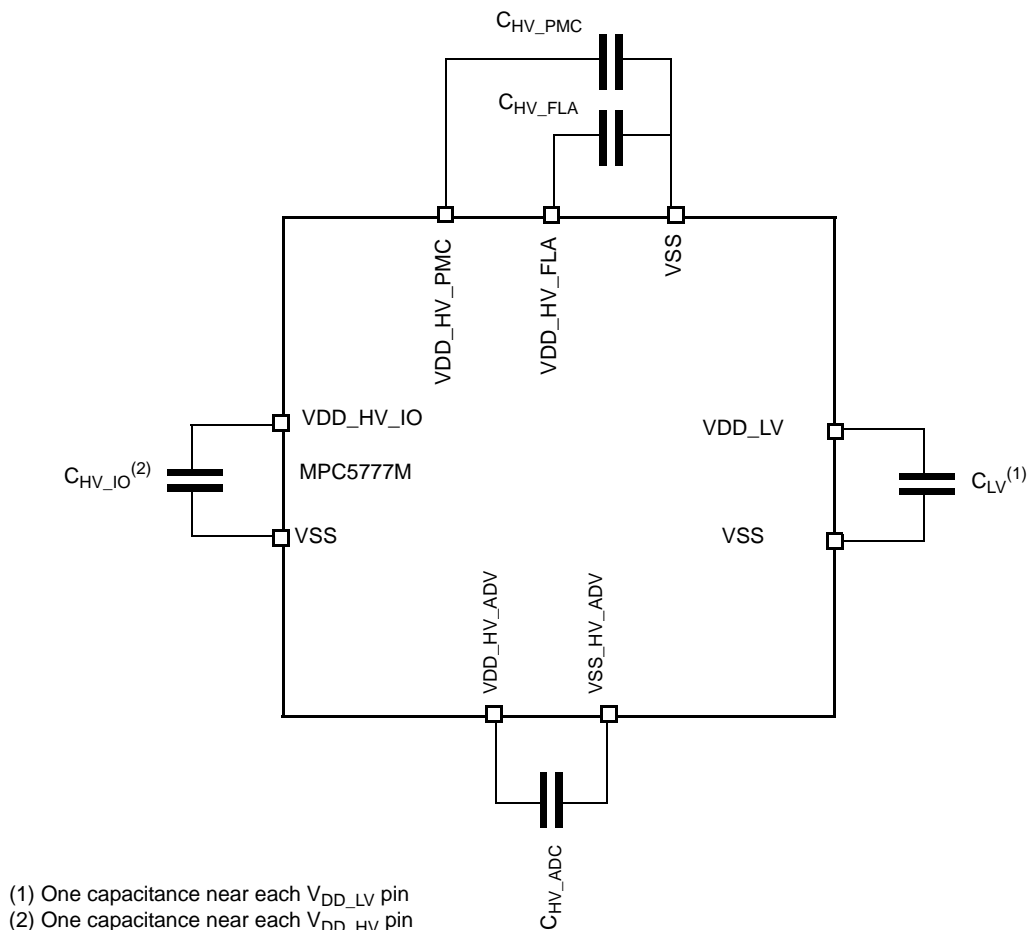

## 3.14 Power management: PMC, POR/LVD, sequencing

### 3.14.1 Power management electrical characteristics

The power management module monitors the different power supplies. It also generates the internal supplies that are required for correct device functionality. The power management is supplied by the  $V_{DD\_HV\_PMC}$  supply (see Table 8).

### 3.14.2 Power management integration

In order to ensure correct functionality of the device, it is recommended to follow below integration scheme.

**Figure 20. Recommended supply pin circuits**

The following table describes the supply stability capacitances required on the device for proper operation.

**Table 35. Device power supply integration**

Symbol		Parameter		Conditions	Value <sup>1</sup>			Unit
					Min	Typ	Max	
C <sub>LV</sub>	SR	Minimum VDD_LV external capacitance <sup>2</sup>	Bulk capacitance	External regulator bandwidth > 20 KHz	10	—	—	μF
			Total bypass capacitance at external pin <sup>3</sup>		Note 3	—	—	
C <sub>HV_IO</sub>	SR	Minimum VDD_HV_IO external capacitance		—	4.7	—	—	μF
C <sub>HV_FL A</sub>	SR	Minimum VDD_HV_FL A external capacitance <sup>4,5</sup>		—	0.75	1.5	—	μF
C <sub>HV_PMC</sub>	SR	Minimum V <sub>DD_HV_PMC</sub> External Capacitance <sup>6,7</sup>		512 BGA balls A29, B28, F24, and G23	2.2	4.7	—	μF
C <sub>HV_ADC</sub>	SR	Minimum V <sub>DD_HV_ADV</sub> external capacitance <sup>8</sup>			1.5	3.3	—	μF

<sup>1</sup> See Figure 20 for capacitor integration.

<sup>2</sup> Recommended X7R or X5R ceramic low ESR capacitors, ±15% variation over voltage, temperature, and aging.

<sup>3</sup> Each VDD\_LV pin requires both a 0.1μF and 0.01μF capacitor for high-frequency bypass and EMC requirements.

<sup>4</sup> The recommended flash regulator composition capacitor is 1.5 μF typical X7R or X5R, with –50% and +35% as min and max. This puts the min cap at 0.75 μF.

<sup>5</sup> Start-up time of the internal flash regulator from release of the LVD360 is worst case 500 us. This is based on the typical CHV\_FL A bulk capacitance value.

<sup>6</sup> For noise filtering it is recommended to add a high frequency bypass capacitance of 0.1 μF between V<sub>DD\_HV\_PMC</sub> and V<sub>SS\_HV</sub>.

<sup>7</sup> In the 512BGA package, V<sub>DD\_HV\_PMC</sub> is shorted to V<sub>DD\_HV\_IO\_MAIN</sub>. Use a local 200 nF capacitor on 512BGA balls A29, B28, F24, G3, in addition to the normal V<sub>DD\_HV\_IO\_MAIN</sub> bulk and local external capacitance.

<sup>8</sup> For noise filtering it is recommended to add a high frequency bypass capacitance of 0.1 μF between V<sub>DD\_HV\_ADV</sub> and V<sub>SS\_HV\_ADV</sub>.

### 3.14.3 3.3 V flash supply

**Table 36. Flash power supply**

Symbol		Parameter	Conditions	Value			Unit
				Min	Typ	Max	
V <sub>DD_HV_FL A</sub> <sup>1</sup>	CC	Flash regulator DC output voltage	Before trimming	3.1 <sup>2</sup>	3.3	3.5	V
			After trimming –40°C ≤ T <sub>J</sub> ≤ 25°C	3.15	3.3	3.4	
			After trimming 25°C < T <sub>J</sub> ≤ 150°C	3.10	3.3	3.4	

<sup>1</sup> Min value accounts for all static and dynamic variations of the regulator (min cap as 0,75uF).

<sup>2</sup> Min value of 3.1 V for VDD\_HV\_REG at 3.15V assumes that the auxiliary regulator on VDD\_LV does not actively provide any current to the chip. If the auxiliary regulator actively provides current, the min value may go lower than 3.1 V drop to IR drop caused by auxiliary current demanding on VDD\_HV\_REG supply.

### 3.14.4 Device voltage monitoring

The LVD/HVDs and their associated levels for the device are given in the following table. The figure below illustrates the workings of voltage monitoring threshold.

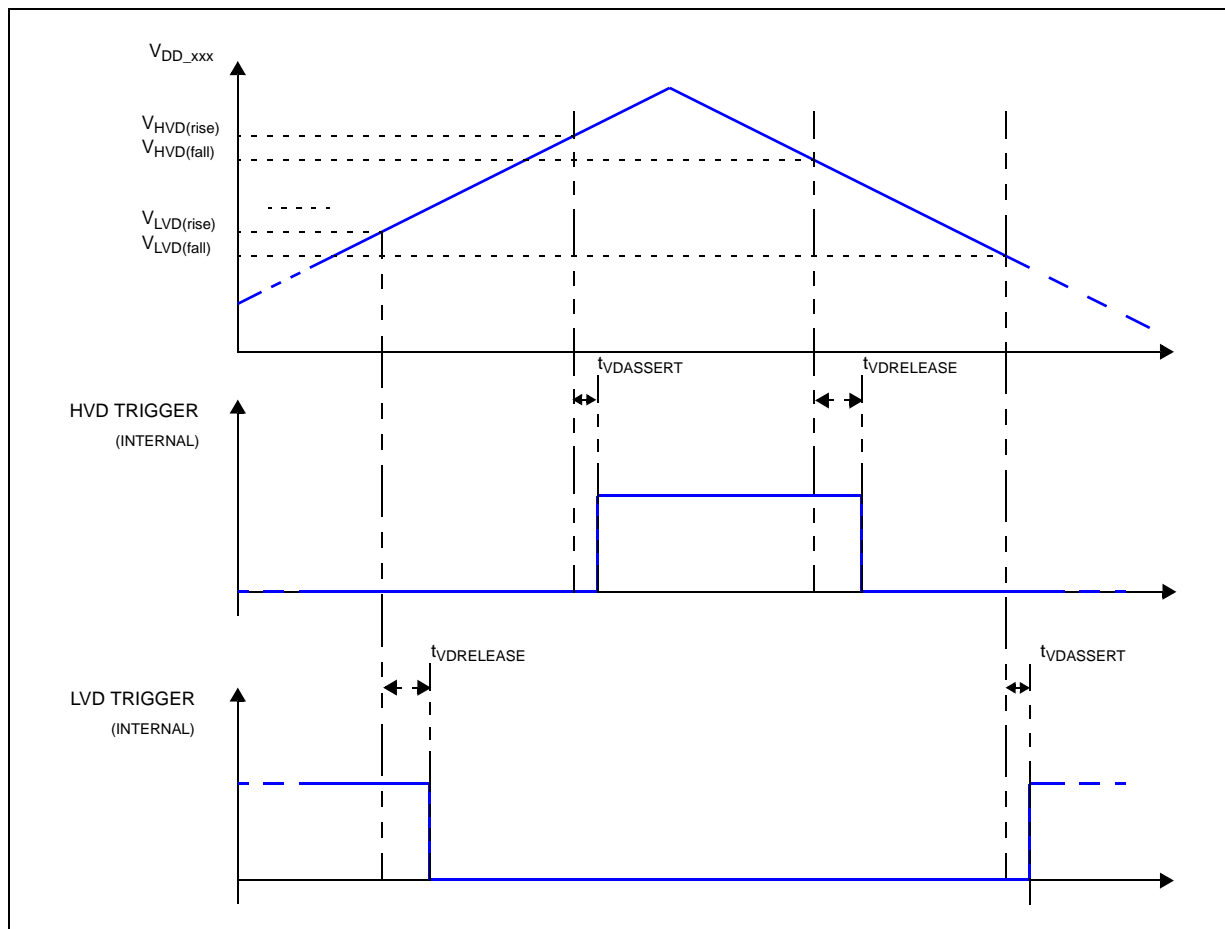

Figure 21. Voltage monitor threshold definition

Table 37. Voltage monitor electrical characteristics<sup>1</sup>

Symbol	Parameter	Conditions	Value			Unit
			Min	Typ	Max	
V <sub>PORUP_LV</sub> <sup>2</sup>	CC LV supply power on reset threshold	Rising voltage (power up)	1111	—	1235	mV
		Falling voltage (power down) <sup>3</sup>	1015	—	1125	
		Hysteresis on power-up	50	—	—	
V <sub>LVD096</sub>	CC LV internal <sup>4</sup> supply low voltage monitoring	See note <sup>5</sup>	1015	—	1145	mV
V <sub>LVD108</sub>	CC Core LV internal <sup>4</sup> supply low voltage monitoring	See note <sup>6</sup>	1150	—	1220	mV
V <sub>LVD112</sub>	CC LV external <sup>7</sup> supply low voltage monitoring	See note <sup>5</sup>	1175	—	1235	mV

Table 37. Voltage monitor electrical characteristics<sup>1</sup> (continued)

Symbol	Parameter	Conditions	Value			Unit
			Min	Typ	Max	
V <sub>HVD140</sub>	CC LV external <sup>10</sup> supply high voltage monitoring	See note <sup>8</sup>	1385	—	1475	mV
V <sub>HVD145</sub>	CC LV external <sup>10</sup> supply high voltage reset threshold	—	1430	—	1510	mV
V <sub>PORUP_HV</sub> <sup>2</sup>	CC HV supply power on reset threshold <sup>9</sup>	Rising voltage (power up) on PMC/IO Main supply	4040	—	4480 <sup>10</sup>	mV
		Rising voltage (power up) on IO JTAG and Osc supply	2730	—	3030	
		Rising voltage (power up) on ADC supply	2870	—	3182	
		Falling voltage (power down) <sup>11</sup>	2850	—	3162	
		Hysteresis on power up <sup>12</sup>	878	—	1630	
V <sub>POR240</sub>	CC HV supply power-on reset voltage monitoring	Rising voltage	2420	—	2780	mV
		Falling voltage	2400	—	2760	
V <sub>LVD270</sub>	CC HV supply low voltage monitoring	Rising voltage	2750	—	3000	mV
		Falling voltage	2700	—	2950	
V <sub>LVD295</sub>	CC Flash supply low voltage monitoring <sup>13</sup>	Rising voltage	—	—	3120	mV
		Falling voltage	2920	—	3100	
V <sub>HVD360</sub>	CC Flash supply high voltage monitoring	Rising voltage	3435	—	3650	mV
		Falling voltage	3415	—	—	
V <sub>LVD360</sub>	CC HV supply low voltage monitoring	Rising voltage	—	—	4000	mV
		Falling voltage	3600	—	3880	
V <sub>LVD400</sub>	CC HV supply low voltage monitoring	Rising voltage	4110	—	4410	mV
		Falling voltage	3970	—	4270	
V <sub>HVD600</sub>	CC HV supply high voltage monitoring	Rising voltage	5560	—	5960	mV
		Falling voltage	5500	—	5900	
t <sub>VDASSERT</sub>	CC Voltage detector threshold crossing assertion	—	0.1	—	2	μs
t <sub>VDRELEASE</sub>	CC Voltage detector threshold crossing de-assertion	—	5	—	20	μs

<sup>1</sup> For V<sub>DD\_LV</sub> levels, a maximum of 30 mV IR drop is incurred from the pin to all sinks on the die. For other LVD, the IR drop is estimated by multiplying the supply current by 0.5 Ω.

<sup>2</sup> V<sub>PORUP\_LV</sub> and V<sub>PORUP\_HV</sub> threshold are untrimmed values before completion of the power-up sequence. All other LVD/HVD thresholds are provided after trimming.

<sup>3</sup> Assume all of LVDs on LV supplies disabled.

<sup>4</sup> LV internal supply levels are measured on device internal supply grid after internal voltage drop.

<sup>5</sup> LVD is released after t<sub>VDRELEASE</sub> temporization when *upper* threshold is crossed, LVD is asserted t<sub>VDASSERT</sub> after detection when *lower* threshold is crossed.

## Electrical characteristics

- <sup>6</sup> This specification is driven by LVD108\_C. There are additional LVDs on PLL and Flash VDD\_LV supply nets which will assert at voltage below LVD108\_C.
- <sup>7</sup> LV external supply levels are measured on the die side of the package bond wire after package voltage drop. This is monitoring external regulator supply voltage and board voltage drop. This does not guarantee device is working down to minimum threshold. For minimum supply, refer to operating condition table.
- <sup>8</sup> HVD is released after  $t_{VDRELEASE}$  temporization when *lower* threshold is crossed, HVD is asserted  $t_{VDASSERT}$  after detection when *upper* threshold is crossed. HVD140 does not cause reset.
- <sup>9</sup> This supply also needs to be below 5472 mV (untrimmed HVD600 min)
- <sup>10</sup> The PMC supply also needs to be below 5472 mV (untrimmed HVD600 mV).
- <sup>11</sup> Untrimmed LVD300\_A will be asserted first on power down.
- <sup>12</sup> Hysteresis is implemented only between the VDD\_HV\_IO\_MAIN High voltage Supplies and the ADC high voltage supply. When these two supplies are shorted together, the hysteresis is as is shown in Table 37. If the supplies are not shorted (VDD\_IO\_MAIN and ADC high voltage supply), then there will be no hysteresis on the high voltage supplies.
- <sup>13</sup> VDD\_HV\_FL A supply range is guaranteed by internal regulator.

### 3.14.5 Power up/down sequencing

Table 38 shows the constraints and relationships for the different power supplies

**Table 38. Device supply relation during power-up/power-down sequence**

		Supply 2 <sup>1</sup>							
		VDD_LV	VDD_HV_PMC	VDD_HV_IO	VDD_HV_FL A	VDD_HV_ADV	VDD_HV_ADR	ALTREFn <sup>2</sup>	VDDSTBY
Supply 1 <sup>1</sup>	VDD_LV								
	VDD_HV_PMC								
	VDD_HV_IO								
	VDD_HV_FL A		2 mA <sup>3</sup>						
	VDD_HV_ADV								
	VDD_HV_ADR					5 mA			
	ALTREFn			10 mA <sup>4</sup>		10 mA <sup>4</sup>			
	VDDSTBY								

<sup>1</sup> Red cells: supply1 (row) can exceed supply2 (column), granted that external circuitry ensure current flowing from supply1 is less than absolute maximum rating current value provided.

<sup>2</sup> ALTREFn are the alternate references for the ADC that can be used in place of the default reference (VDD\_HV\_ADR\_\*). They are SARB.ALTREF and SAR2.ALTREF.

<sup>3</sup> VDD\_HV\_FL A is generated internally in normal mode. Above current constraints is guaranteed.

<sup>4</sup> ADC performances is not guaranteed with ALTREFn above VDD\_HV\_IO / VDD\_HV\_ADV

During power-up, all functional terminals are maintained into a known state as described within the following table.

Table 39. Functional terminals state during power-up and reset

TERMINAL TYPE <sup>1</sup>	POWERUP <sup>2</sup> pad state	RESET pad state	DEFAULT pad state <sup>3</sup>	Comments
PORST	Strong pull-down <sup>4</sup>	Weak pull-down	Weak pull-down	Power-on reset pad
ESR0 <sup>5</sup>	Strong pull-down	Strong pull-down	Weak pull-up	Functional reset pad.
ESR1	High impedance	Weak pull-up	Weak pull-up	—
TESTMODE	Weak pull-down	Weak pull-down <sup>6</sup>	Weak pull-down <sup>6</sup>	—
GPIO	Weak pull-up <sup>4</sup>	Weak pull-up	Weak pull-up	—
ANALOG	High impedance	High impedance	High impedance	—
ERROR0	High impedance	High impedance	High impedance	During functional reset, pad state can be overridden by FCCU
JCOMP	High impedance	Weak pull-down	Weak pull-down	—
TCK	High impedance	Weak pull-down	Weak pull-down	—
TMS	High impedance	Weak pull-up	Weak pull-up	—
TDI	High impedance	Weak pull-up	Weak pull-up	—
TDO	High impedance	Weak pull-up	High impedance	—

<sup>1</sup> Refer to pinout information for terminal type

<sup>2</sup> POWERUP state is guaranteed from  $V_{DD\_HV\_IO} > 1.1$  V and maintained until supply cross the power-on reset threshold:  $V_{PORUP\_LV}$  for LV supply,  $V_{PORUP\_HV}$  for high voltage supply.

<sup>3</sup> Before software configuration

<sup>4</sup> Pull-down and pull-up strength are provided as part of Table 13 in Section 3.6.1, I/O input DC characteristics. Pull-up/Pull-down are activated within 2  $\mu$ s after internal reset has been asserted. Actual pad transition will depend on external capacitance.

<sup>5</sup> Unlike ESR0, ESR1 is provided as normal GPIO and implements weak pull-up during power-up.

<sup>6</sup> An internal pull-down is implemented on the TESTMODE pin to prevent the device from entering test mode if the package TESTMODE pin is not connected. It is recommended to connect the TESTMODE pin to  $V_{SS\_HV\_IO}$  on the board for maximum robustness, but not required. The value of TESTMODE is latched at the negation of reset and has no affect afterward. The device will not exit functional reset with the TESTMODE pin asserted during power-up. The TESTMODE pin can be connected externally directly to ground without any other components.

## 3.15 Flash memory electrical characteristics

The following sections contain flash memory electrical specifications.

### 3.15.1 Flash memory program and erase specifications

#### NOTE

All timing, voltage, and current numbers specified in this section are defined for a single embedded flash memory within an SoC, and represent average currents for given supplies and operations.

## Electrical characteristics

Table 40 shows the estimated Program/Erase times.

**Table 40. Flash memory program and erase specifications (pending characterization)**

Symbol	Characteristic <sup>1</sup>	Typ <sup>2</sup>	Factory Programming <sup>3,4</sup>		Field Update			Units
			Initial Max	Initial Max Full Temp	Typical End of Life <sup>5</sup>	Lifetime Max <sup>6</sup>		
			20°C≤ T <sub>a</sub> ≤ 30°C	-40°C≤ T <sub>J</sub> ≤ 150°C	-40°C≤ T <sub>J</sub> ≤ 150 °C	≤ 1,000 cycles	≤ 250,000 cycles	
t <sub>dwpgm</sub>	Doubleword (64 bits) program time	43	100	150	55	500		μs
t <sub>ppgm</sub>	Page (256 bits) program time	73	200	300	108	500		μs
t <sub>qppgm</sub>	Quad-page (1024 bits) program time	268	800	1,200	396	2,000		μs
t <sub>16kers</sub>	16 KB Block erase time	168	290	320	250	1,000		ms
t <sub>16kpgn</sub>	16 KB Block program time	34	45	50	40	1,000		ms
t <sub>32kers</sub>	32 KB Block erase time	217	360	390	310	1,200		ms
t <sub>32kpgm</sub>	32 KB Block program time	69	100	110	90	1,200		ms
t <sub>64kers</sub>	64 KB Block erase time	315	490	590	420	1,600		ms
t <sub>64kpgm</sub>	64 KB Block program time	138	180	210	170	1,600		ms
t <sub>256kers</sub>	256 KB Block erase time	884	1,520	2,030	1,080	4,000	—	ms
t <sub>256kpgm</sub>	256 KB Block program time	552	720	880	650	4,000	—	ms

<sup>1</sup> Program times are actual hardware programming times and do not include software overhead. Block program times assume quad-page programming.

<sup>2</sup> Typical program and erase times represent the median performance and assume nominal supply values and operation at 25 °C. Typical program and erase times may be used for throughput calculations.

<sup>3</sup> Conditions: ≤ 150 cycles, nominal voltage.

<sup>4</sup> Plant Programming times provide guidance for timeout limits used in the factory.

<sup>5</sup> Typical End of Life program and erase times represent the median performance and assume nominal supply values. Typical End of Life program and erase values may be used for throughput calculations.

<sup>6</sup> Conditions: -40°C ≤ T<sub>J</sub> ≤ 150°C; full spec voltage.

### 3.15.2 Flash memory FERS program and erase specifications

Table 41. Flash memory FERS program and erase specifications (pending characterization)

Symbol	Characteristic <sup>1</sup>	Factory Programming with FERS=1 and Vfers pin is 5V ± 5% <sup>2</sup>			Units
		Typ <sup>3</sup>	Initial Max	Initial Max Full Temp	
			20°C ≤ T <sub>A</sub> ≤ 30°C <sup>4</sup>	-40°C ≤ T <sub>J</sub> ≤ 150°C <sup>4</sup>	
t <sub>dwpgm</sub>	Doubleword (64 bits) program time	30	90	135	µs
t <sub>ppgm</sub>	Page (256 bits) program time	43	145	218	µs
t <sub>qppgn</sub>	Quad-page (1024 bits) program time	134	530	795	µs
t <sub>16kers</sub>	16 KB erase time	160	782	782	ms
t <sub>16kpgn</sub>	16 KB program time	18	24	35	ms
t <sub>32kers</sub>	32 KB erase time	190	782	782	ms
t <sub>32kpgm</sub>	32 KB program time	36	47	68	ms
t <sub>64kers</sub>	64 KB erase time	250	782	782	ms
t <sub>64kpgm</sub>	64 KB program time	72	94	135	ms
t <sub>256kers</sub>	256 KB erase time	600	1,380	2,070	ms
t <sub>256kpgm</sub>	256 KB program time	288	374	568	ms

<sup>1</sup> Program times are actual hardware programming times and do not include software overhead. Block program times assume quad-page programming.

<sup>2</sup> Conditions: ≤150 cycles, nominal voltage.

<sup>3</sup> Typical program and erase times represent the median performance and assume nominal supply values and operation at 25 °C. Typical program and erase times may be used for throughput calculations.

<sup>4</sup> Plant Programming times provide guidance for timeout limits used in the factory.

### 3.15.3 Flash memory Array Integrity and Margin Read specifications

**Table 42. Flash memory Array Integrity and Margin Read specifications (characterized but not tested)**

Symbol	Characteristic	Min	Typical	Max <sup>1</sup>	Units <sup>2</sup>
$t_{ai16kseq}$	Array Integrity time for sequential sequence on 16KB block.	—	—	$512 \times T_{period} \times N_{read}$	—
$t_{ai32kseq}$	Array Integrity time for sequential sequence on 32KB block.	—	—	$1024 \times T_{period} \times N_{read}$	—
$t_{ai64kseq}$	Array Integrity time for sequential sequence on 64KB block.	—	—	$2048 \times T_{period} \times N_{read}$	—
$t_{ai256kseq}$	Array Integrity time for sequential sequence on 256KB block.	—	—	$8192 \times T_{period} \times N_{read}$	—
$t_{aifullseq}$	Array Integrity time for sequential sequence full array.	—	—	$3.77e5 \times T_{period} \times N_{read}$	—
$t_{aifullprop}$	Array Integrity time for proprietary sequence (applies to full array or single block).	—	—	$9.96e6 \times T_{period} \times N_{read}$	—
$t_{mr16kseq}$	Margin Read time for sequential sequence on 16KB block.	73.81	—	110.7	$\mu s$
$t_{mr32kseq}$	Margin Read time for sequential sequence on 32KB block.	128.43	—	192.6	$\mu s$
$t_{mr64kseq}$	Margin Read time for sequential sequence on 64KB block.	237.65	—	356.5	$\mu s$
$t_{mr256kseq}$	Margin Read time for sequential sequence on 256KB block.	893.01	—	1,339.5	$\mu s$
$t_{mrfull}$	Margin Read time for sequential sequence full array.	45.21	—	60.26	ms

<sup>1</sup> Array Integrity times need to be calculated and are dependent on system frequency and number of clocks per read. The equation presented require  $T_{period}$  (which is the unit accurate period, thus for 200 MHz,  $T_{period}$  would equal  $5e-9$ ) and  $N_{read}$  (which is the number of clocks required for read, including pipeline contribution. Thus for a read setup that requires 6 clocks to read with no pipeline,  $N_{read}$  would equal 6. For a read setup that requires 6 clocks to read, and has the address pipeline set to 2,  $N_{read}$  would equal 4 (or  $6 - 2$ ).)

<sup>2</sup> The units for Array Integrity are determined by the period of the system clock. If unit accurate period is used in the equation, the results of the equation are also unit accurate.

### 3.15.4 Flash memory module life specifications

Table 43. Flash memory module life spec (pending characterization)

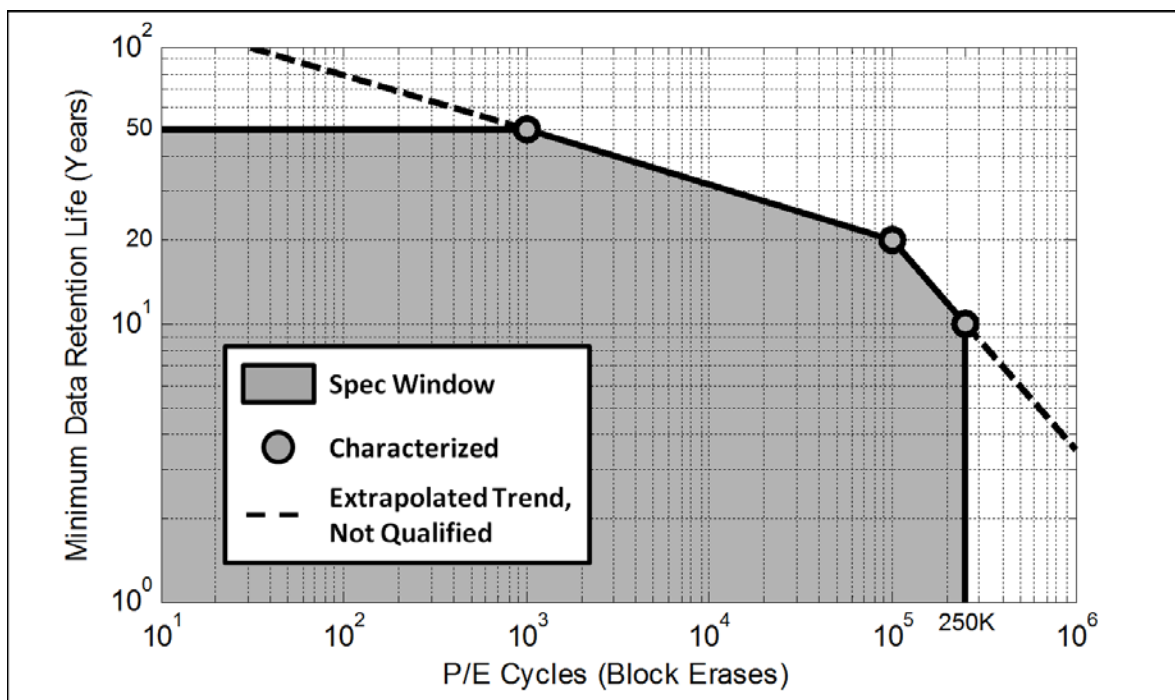

Symbol	Characteristic	Conditions	Min	Typical	Units
Array P/E cycles	Number of program/erase cycles per block for 16 KB, 32 KB and 64 KB blocks. <sup>1</sup>	—	250,000	—	P/E cycles
	Number of program/erase cycles per block for 256 KB blocks. <sup>2</sup>	—	1,000	250,000	P/E cycles
Data retention	Minimum data retention.	Blocks with 0 – 1,000 P/E cycles.	50	—	Years
		Blocks with 100,000 P/E cycles.	20	—	Years
		Blocks with 250,000 P/E cycles.	10	—	Years

<sup>1</sup> Program and erase supported across standard temperature specs.

<sup>2</sup> Program and erase supported across standard temperature specs.

### 3.15.5 Data retention vs program/erase cycles

Graphically, Data Retention versus Program/Erase Cycles can be represented by the following figure. The spec window represents qualified limits. The extrapolated dotted line demonstrates technology capability, however is beyond the qualification limits.

### 3.15.6 Flash memory AC timing specifications

**Table 44. Flash memory AC timing specifications (characterized but not tested)**

Symbol	Characteristic	Min	Typical	Max	Units
$t_{psus}$	Time from setting the MCR-PSUS bit until MCR-DONE bit is set to a 1.	—	7 plus four system clock periods	9.1 plus four system clock periods	$\mu s$
$t_{esus}$	Time from setting the MCR-ESUS bit until MCR-DONE bit is set to a 1.	—	16 plus four system clock periods	20.8 plus four system clock periods	$\mu s$
$t_{res}$	Time from clearing the MCR-ESUS or PSUS bit with EHV = 1 until DONE goes low.	—	—	100	ns
$t_{done}$	Time from 0 to 1 transition on the MCR-EHV bit initiating a program/erase until the MCR-DONE bit is cleared.	—	—	5	ns
$t_{dones}$	Time from 1 to 0 transition on the MCR-EHV bit aborting a program/erase until the MCR-DONE bit is set to a 1.	—	16 plus four system clock periods	20.8 plus four system clock periods	$\mu s$
$t_{drcv}$	Time to recover once exiting low power mode.	16 plus seven system clock periods	—	45 plus seven system clock periods	$\mu s$
$t_{aistart}$	Time from 0 to 1 transition of UT0-AIE initiating a Margin Read or Array Integrity until the UT0-AID bit is cleared. This time also applies to the resuming from a suspend or breakpoint by clearing AISUS or clearing NAIBP	—	—	5	ns
$t_{aistop}$	Time from 1 to 0 transition of UT0-AIE initiating an Array Integrity abort until the UT0-AID bit is set. This time also applies to the UT0-AISUS to UT0-AID setting in the event of a Array Integrity suspend request.	—	—	80 plus fifteen system clock periods	ns
$t_{mrstop}$	Time from 1 to 0 transition of UT0-AIE initiating a Margin Read abort until the UT0-AID bit is set. This time also applies to the UT0-AISUS to UT0-AID setting in the event of a Margin Read suspend request.	10.36 plus four system clock periods	—	20.42 plus four system clock periods	$\mu s$

### 3.15.7 Flash read wait state and address pipeline control settings

Table 45 describes the recommended RWSC and APC settings at various operating frequencies based on specified intrinsic flash access times of the C55FMC array at 150 °C.

**Table 45. Flash Read Wait State and Address Pipeline Control Combinations**

Flash Frequency	RWSC setting	APC setting
0 MHz < fFLASH ≤ 33 MHz	0	0
33 MHz < fFLASH ≤ 100 MHz	2	1
100 MHz < fFLASH ≤ 133 MHz	3	1
133 MHz < fFLASH ≤ 167 MHz	4	1
167 MHz < fFLASH ≤ 200 MHz	5	2

## 3.16 AC specifications

All AC timing specifications are valid up to 150 °C, except where explicitly noted.

### 3.16.1 Debug and calibration interface timing

#### 3.16.1.1 JTAG interface timing

**Table 46. JTAG pin AC electrical characteristics<sup>1,2</sup>**

#	Symbol	Characteristic	Value		Unit
			Min	Max	
1	t <sub>JCYC</sub>	CC TCK cycle time	100	—	ns
2	t <sub>JDC</sub>	CC TCK clock pulse width	40	60	%
3	t <sub>TCKRISE</sub>	CC TCK rise and fall times (40%–70%)	—	3	ns
4	t <sub>TMSS</sub> , t <sub>TDIS</sub>	CC TMS, TDI data setup time	5	—	ns
5	t <sub>TMSH</sub> , t <sub>TDIH</sub>	CC TMS, TDI data hold time	5	—	ns
6	t <sub>TDOV</sub>	CC TCK low to TDO data valid	—	16 <sup>3</sup>	ns
7	t <sub>TDOI</sub>	CC TCK low to TDO data invalid	0	—	ns
8	t <sub>TDOHZ</sub>	CC TCK low to TDO high impedance	—	15	ns
9	t <sub>JCMPPW</sub>	CC JCOMP assertion time	100	—	ns
10	t <sub>JCMPS</sub>	CC JCOMP setup time to TCK low	40	—	ns
11	t <sub>BSDV</sub>	CC TCK falling edge to output valid	—	600 <sup>4</sup>	ns
12	t <sub>BSDVZ</sub>	CC TCK falling edge to output valid out of high impedance	—	600	ns
13	t <sub>BSDHZ</sub>	CC TCK falling edge to output high impedance	—	600	ns
14	t <sub>BSDST</sub>	CC Boundary scan input valid to TCK rising edge	15	—	ns
15	t <sub>BSDHT</sub>	CC TCK rising edge to boundary scan input invalid	15	—	ns

<sup>1</sup> These specifications apply to JTAG boundary scan only. See [Table 47](#) for functional specifications.

<sup>2</sup> JTAG timing specified at V<sub>DD\_HV\_IO\_JTAG</sub> = 4.0 V to 5.5 V, and maximum loading per pad type as specified in the I/O section of the data sheet.

<sup>3</sup> Timing includes TCK pad delay, clock tree delay, logic delay and TDO output pad delay.

## Electrical characteristics

- <sup>4</sup> Applies to all pins, limited by pad slew rate. Refer to IO delay and transition specification and add 20 ns for JTAG delay.

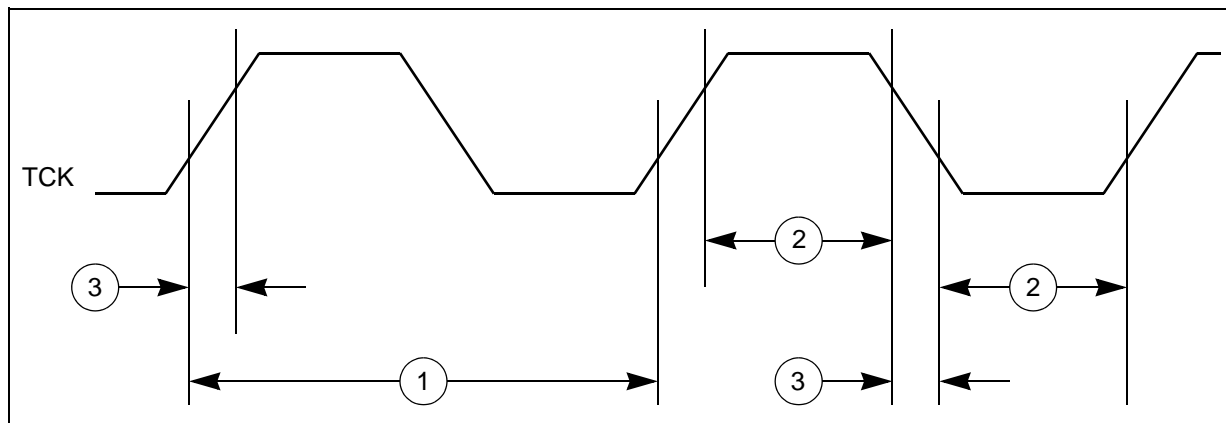

Figure 22. JTAG test clock input timing

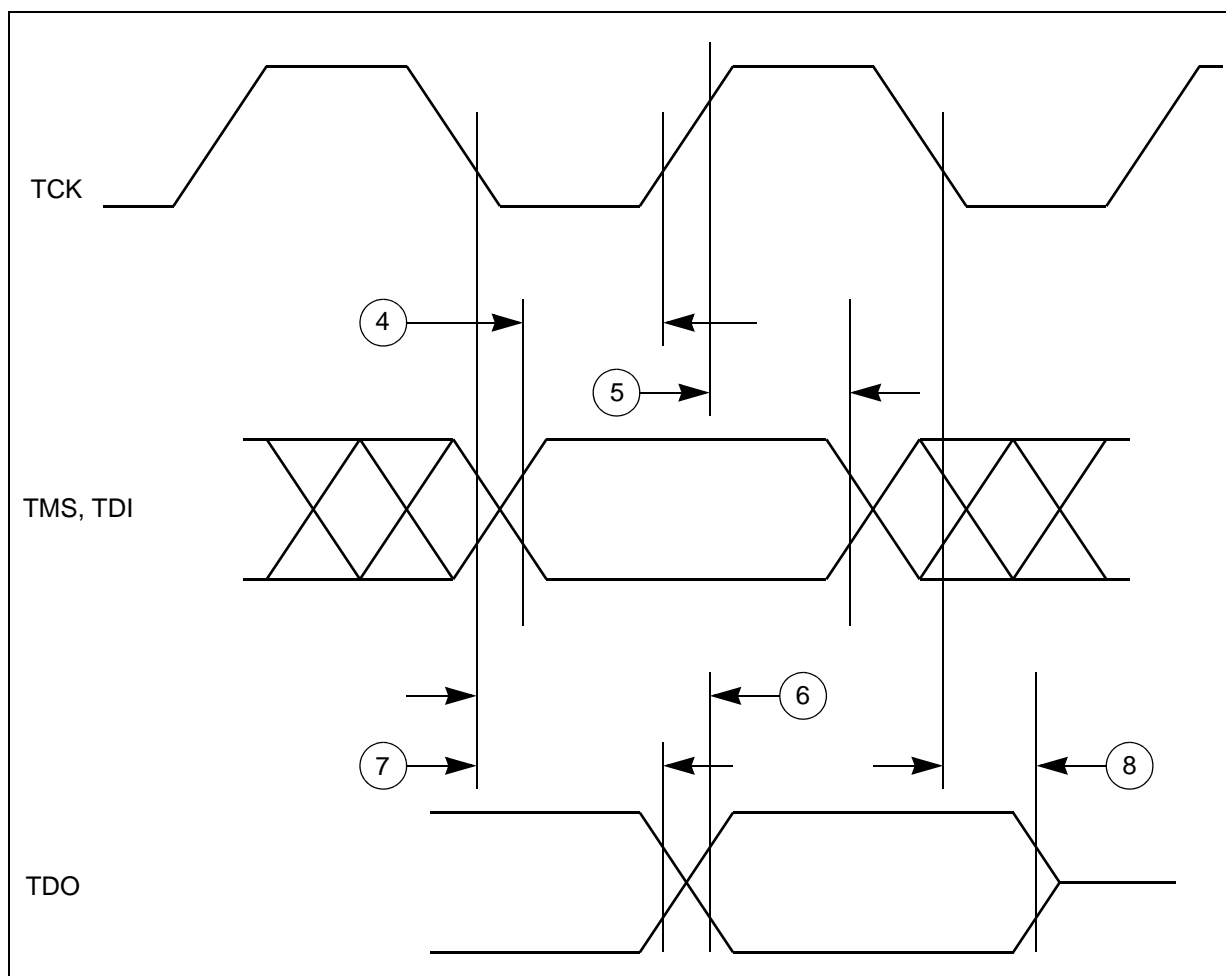

Figure 23. JTAG test access port timing

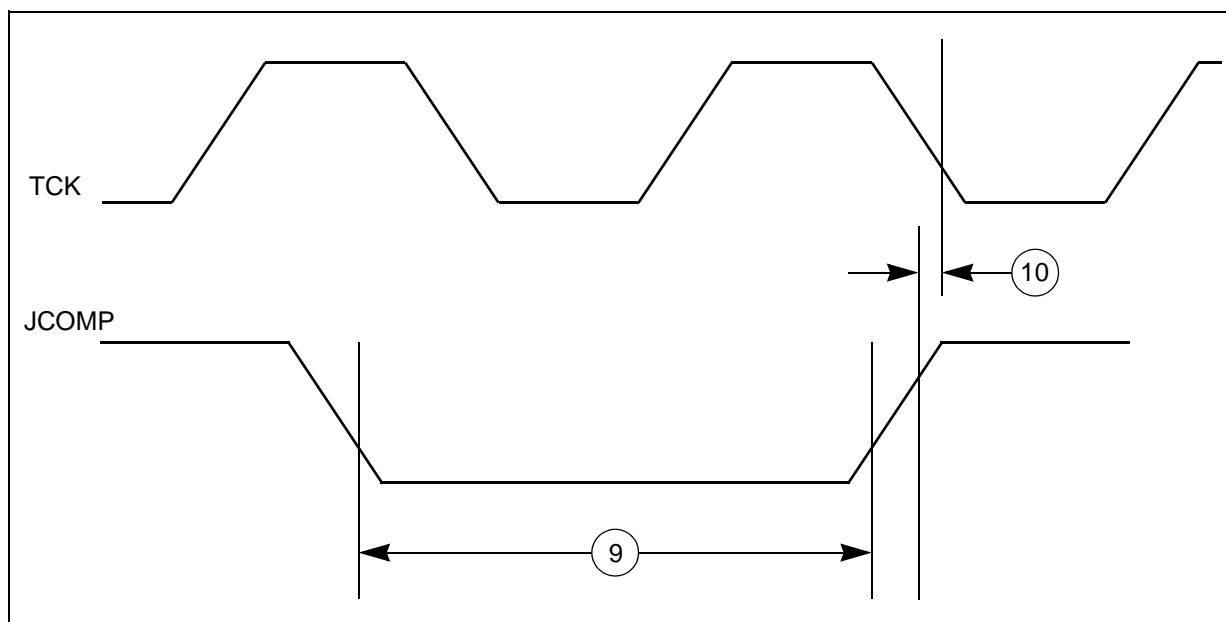

Figure 24. JTAG JCOMP timing

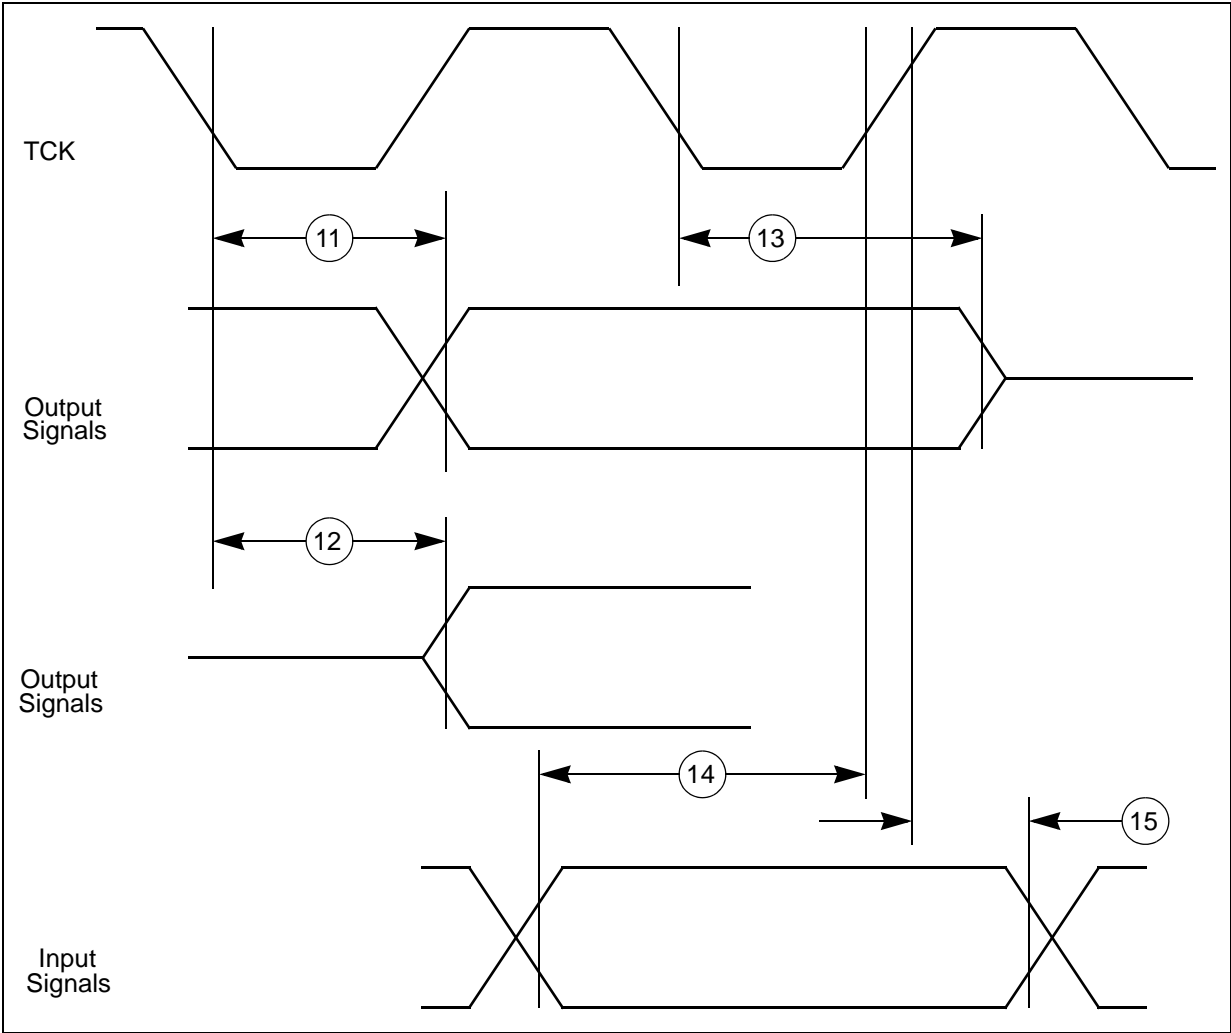

Figure 25. JTAG boundary scan timing

3.16.1.2 Nexus interface timing

Table 47. Nexus debug port timing<sup>1</sup>

#	Symbol	Characteristic	Value		Unit
			Min	Max	
7	$t_{\text{EVTIPW}}$	CC $\overline{\text{EVTI}}$ pulse width	4	—	$t_{\text{CYC}}^2$
8	$t_{\text{EVTOPW}}$	CC $\overline{\text{EVTO}}$ pulse width	40	—	ns
9	$t_{\text{TCYC}}$	CC TCK cycle time	$2^{3,4}$	—	$t_{\text{CYC}}^2$
9	$t_{\text{TCYC}}$	Absolute minimum TCK cycle time <sup>5</sup> (TDO/TDOC sampled on posedge of TCK)	$40^6$	—	ns
		Absolute minimum TCK cycle time <sup>7</sup> (TDO/TDOC sampled on negedge of TCK)	$20^6$	—	
11 <sup>8</sup>	$t_{\text{NTDIS}}$	CC TDI/TDIC data setup time	5	—	ns

Table 47. Nexus debug port timing<sup>1</sup> (continued)

#	Symbol	Characteristic	Value		Unit
			Min	Max	
12	$t_{NTDIH}$	CC TDI/TDIC data hold time	5	—	ns
13 <sup>9</sup>	$t_{NTMSS}$	CC TMS/TMSC data setup time	5	—	ns
14	$t_{NTMSH}$	CC TMS/TMSC data hold time	5	—	ns
15 <sup>10</sup>	—	CC TDO/TDOC propagation delay from falling edge of TCK <sup>11</sup>	—	16	ns
16	—	CC TDO/TDOC hold time with respect to TCK falling edge (minimum TDO/TDOC propagation delay)	2.25	—	ns

<sup>1</sup> Nexus timing specified at  $V_{DD\_HV\_IO\_JTAG} = 4.0\text{ V to }5.5\text{ V}$ , and maximum loading per pad type as specified in the I/O section of the data sheet.

<sup>2</sup>  $t_{CYC}$  is system clock period.

<sup>3</sup> Achieving the absolute minimum TCK cycle time may require a maximum clock speed (system frequency / 8) that is less than the maximum functional capability of the design (system frequency / 4) depending on the actual peripheral frequency being used. To ensure proper operation TCK frequency should be set to the peripheral frequency divided by a number greater than or equal to that specified here.

<sup>4</sup> This is a functionally allowable feature. However, it may be limited by the maximum frequency specified by the Absolute minimum TCK period specification.

<sup>5</sup> This value is TDO/TDOC propagation time 36ns + 4 ns setup time to sampling edge.

<sup>6</sup> This may require a maximum clock speed (system frequency / 8) that is less than the maximum functional capability of the design (system frequency / 4) depending on the actual system frequency being used.

<sup>7</sup> This value is TDO/TDOC propagation time 16ns + 4 ns setup time to sampling edge.

<sup>8</sup> TDIC represents the TDI bit frame of the scan packet in compact JTAG 2-wire mode.

<sup>9</sup> TMSC represents the TMS bit frame of the scan packet in compact JTAG 2-wire mode.

<sup>10</sup> TDOC represents the TDO bit frame of the scan packet in compact JTAG 2-wire mode.

<sup>11</sup> Timing includes TCK pad delay, clock tree delay, logic delay and TDO/TDOC output pad delay.

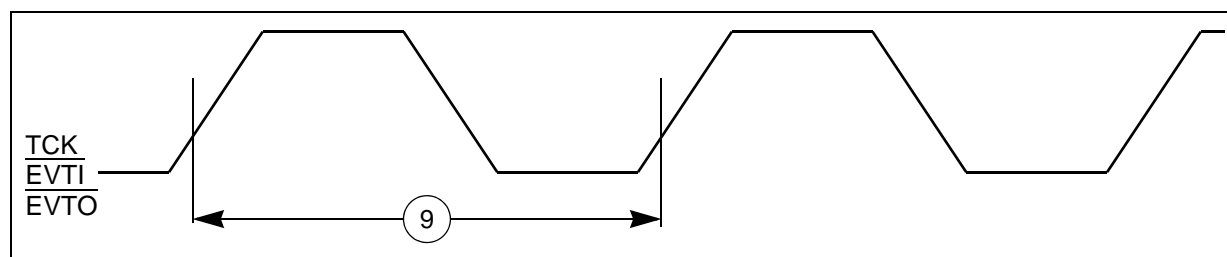

Figure 26. Nexus event trigger and test clock timings

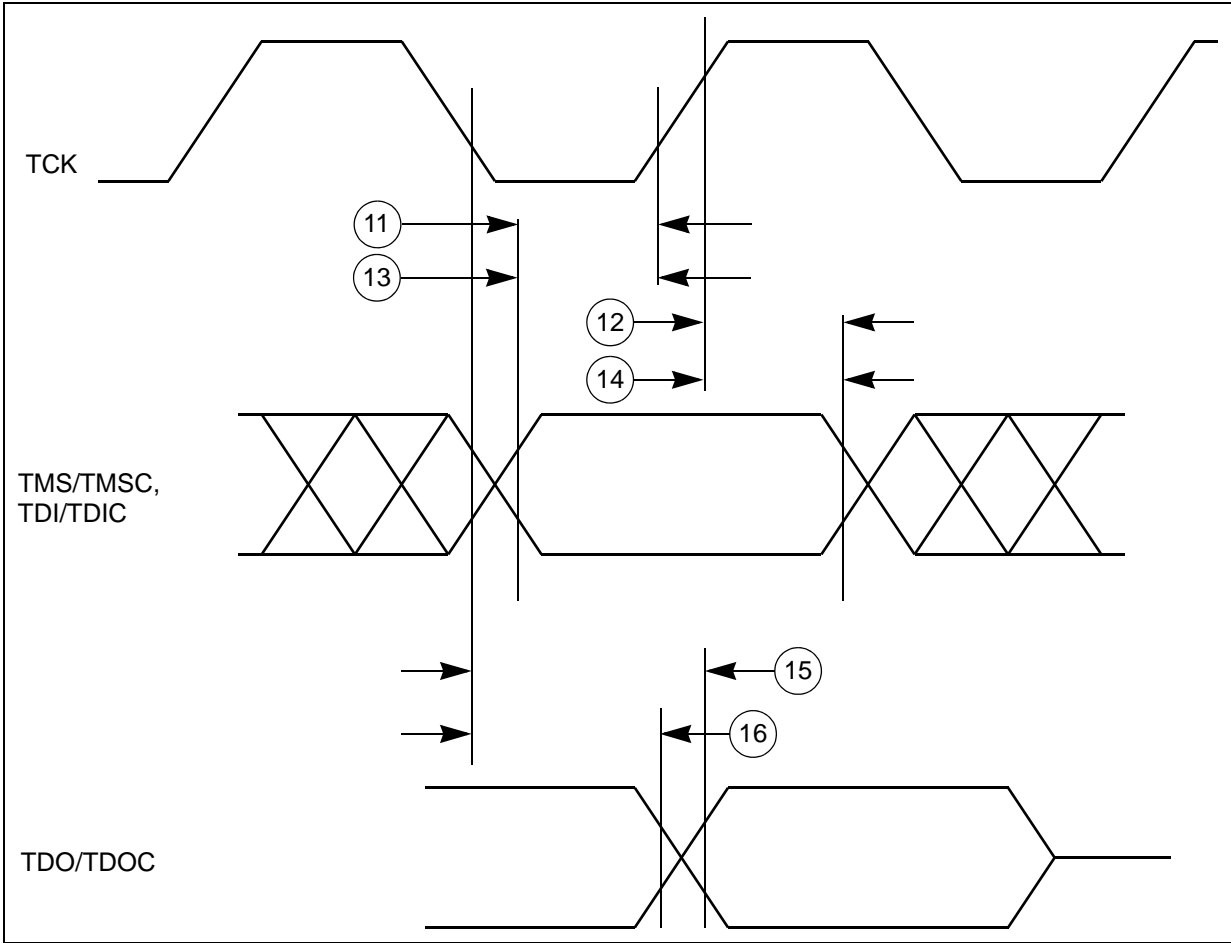

Figure 27. Nexus TDI/TDIC, TMS/TMSC, TDO/TDOC timing

3.16.1.3 Aurora LVDS interface timing

Table 48. Aurora LVDS interface timing specifications

Symbol			Parameter	Value			Unit
				Min	Typ	Max	
Data Rate							
—	SR	Data rate	—	—	1250	Mbps	
STARTUP							
t <sub>STRT_BIAS</sub>	CC	Bias startup time <sup>1</sup>	—	—	5	μs	
t <sub>STRT_TX</sub>	CC	Transmitter startup time <sup>2</sup>	—	—	5	μs	
t <sub>STRT_RX</sub>	CC	Receiver startup time <sup>3</sup>	—	—	4	μs	

<sup>1</sup> Startup time is defined as the time taken by LVDS current reference block for settling bias current after its pwr\_down (power down) has been deasserted. LVDS functionality is guaranteed only after the startup time.

<sup>2</sup> Startup time is defined as the time taken by LVDS transmitter for settling after its pwr\_down (power down) has been deasserted. Here it is assumed that current reference is already stable (see Bias start-up time). LVDS functionality is guaranteed only after the startup time.

- <sup>3</sup> Startup time is defined as the time taken by LVDS receiver for settling after its pwr\_down (power down) has been deasserted. Here it is assumed that current reference is already stable (see Bias start-up time). LVDS functionality is guaranteed only after the startup time.

### 3.16.1.4 Aurora debug port timing

Table 49. Aurora debug port timing

#	Symbol		Characteristic	Value		Unit
				Min	Max	
1	t <sub>REFCLK</sub>	CC	Reference clock frequency	625	1250	MHz
1a	t <sub>MCYC</sub>	CC	Reference clock rise/fall time	—	400	ps
2	t <sub>RCDC</sub>	CC	Reference clock duty cycle	45	55	%
3	J <sub>RC</sub>	CC	Reference clock jitter	—	40	ps
4	t <sub>STABILITY</sub>	CC	Reference clock stability	50	—	PPM
5	BER	CC	Bit error rate	—	10 <sup>-12</sup>	—
6	J <sub>D</sub>	SR	Transmit lane deterministic jitter	—	0.17	OUI
7	J <sub>T</sub>	SR	Transmit lane total jitter	—	0.35	OUI
8	S <sub>O</sub>	CC	Differential output skew	—	20	ps
9	S <sub>MO</sub>	CC	Lane to lane output skew	—	1000	ps
10	OUI	CC	Aurora lane unit interval <sup>1</sup>	625 Mbps	1600	ps
				1.25 Gbps	800	

<sup>1</sup> ± 100 PPM

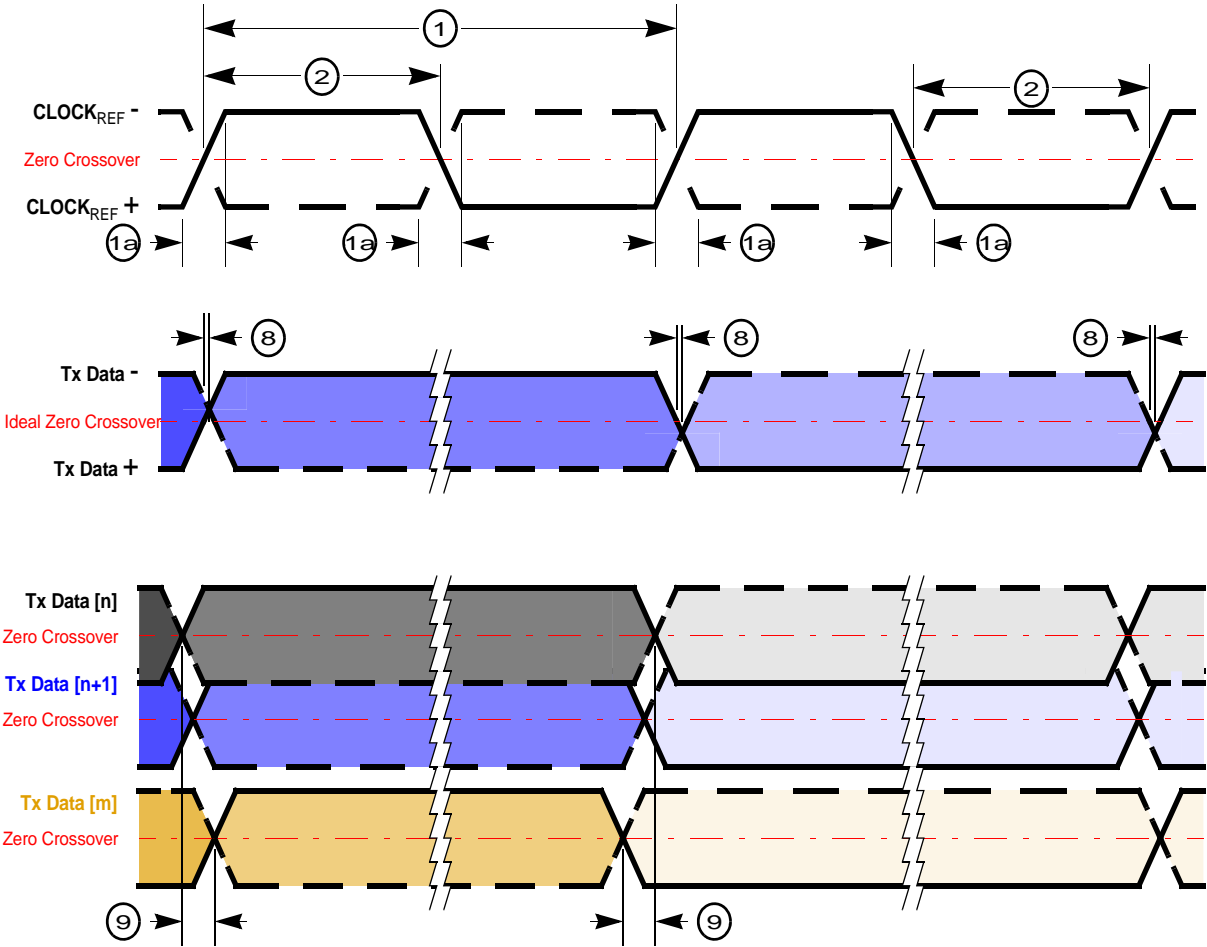

Figure 28. Aurora timings

### 3.16.2 DSPI timing with CMOS and LVDS<sup>1</sup> pads

DSPI channel frequency support is shown in [Table 50](#). Timing specifications are shown in [Table 51](#), [Table 52](#), [Table 54](#), [Table 55](#) and [Table 56](#).

**Table 50. DSPI channel frequency support**

DSPI use mode		Max usable frequency (MHz) <sup>1,2</sup>
CMOS (Master mode)	Full duplex – Classic timing ( <a href="#">Table 51</a> )	17
	Full duplex – Modified timing ( <a href="#">Table 52</a> )	30
	Output only mode (SCK/SOUT/PCS) ( <a href="#">Table 51</a> and <a href="#">Table 52</a> )	30
	Output only mode TSB mode (SCK/SOUT/PCS) ( <a href="#">Table 56</a> )	30
LVDS (Master mode) <sup>3</sup>	Full duplex – Modified timing ( <a href="#">Table 54</a> )	33
	Output only mode TSB mode (SCK/SOUT/PCS) ( <a href="#">Table 55</a> )	40

<sup>1</sup> Maximum usable frequency can be achieved if used with fastest configuration of the highest drive pads.

<sup>2</sup> Maximum usable frequency does not take into account external device propagation delay.

<sup>3</sup>  $\mu$ S Channel and LVDS timing is not supported for DSPI12.

#### 3.16.2.1 DSPI master mode full duplex timing with CMOS and LVDS pads

##### 3.16.2.1.1 DSPI CMOS Master Mode – Classic Timing

**Table 51. DSPI CMOS master classic timing (full duplex and output only) – MTFE = 0, CPHA = 0 or 1<sup>1</sup>**

#	Symbol		Characteristic	Condition		Value <sup>2</sup>		Unit
				Pad drive <sup>3</sup>	Load (C <sub>L</sub> )	Min	Max

				Very strong	25 pF	—	7.0	ns
				Strong	50 pF	—	8.0	
				Medium	50 pF	—	16.0	
SOUT data hold time (after SCK edge)								

**Table 51. DSPI CMOS master classic timing (full duplex and output only) – MTFE = 0, CPHA = 0 or 1<sup>1</sup>**

#	Symbol		Characteristic	Condition		Value <sup>2</sup>		Unit
				Pad drive <sup>3</sup>	Load (C <sub>L</sub> )	Min	Max	
10	t <sub>HO</sub>	CC	SOUT data hold time after SCK <sup>10</sup>	SOUT and SCK drive strength				ns
				Very strong	25 pF	-7.7	—	
				Strong	50 pF	-11.0	—	
				Medium	50 pF	-15.0	—	

<sup>1</sup> All output timing is worst case and includes the mismatching of rise and fall times of the output pads.

<sup>2</sup> All timing values for output signals in this table are measured to 50% of the output voltage.

<sup>3</sup> Timing is guaranteed to same drive capabilities for all signals, mixing of pad drives may reduce operating speeds and may cause incorrect operation.

<sup>4</sup> N is the number of clock cycles added to time between PCS assertion and SCK assertion and is software programmable using DSPI\_CTARx[PSSCK] and DSPI\_CTARx[CSSCK]. The minimum value is 2 cycles unless TSB mode or Continuous SCK clock mode is selected, in which case, N is automatically set to 0 clock cycles (PCS and SCK are driven by the same edge of DSPI\_CLKn).

<sup>5</sup> t<sub>SYS</sub> is the period of DSPI\_CLKn clock, the input clock to the DSPI module. Maximum frequency is 100 MHz (min t<sub>SYS</sub> = 10 ns).

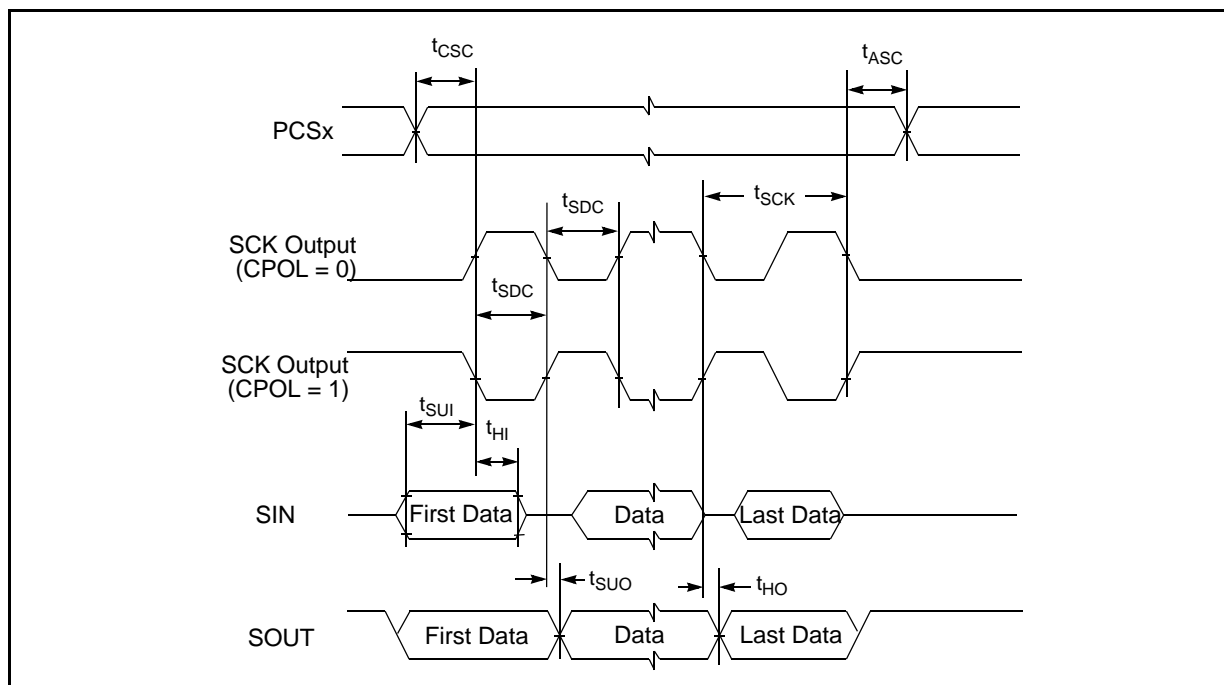

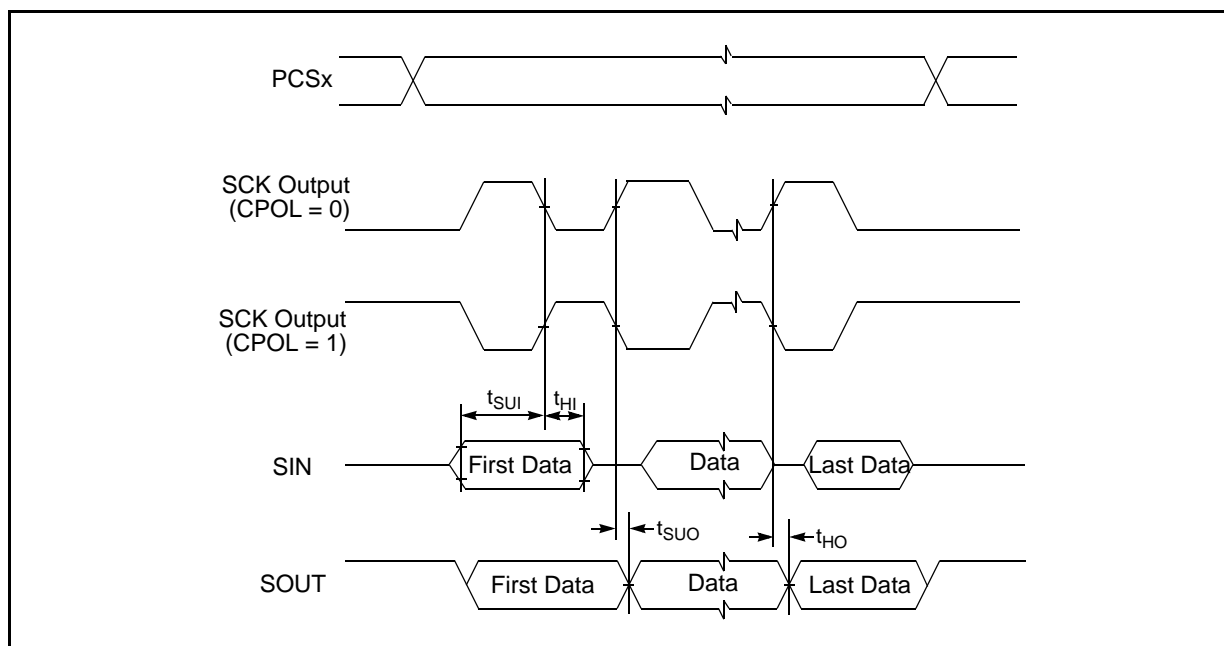

<sup>6</sup> M is the number of clock cycles added to time between SCK negation and PCS negation and is software programmable using DSPI\_CTARx[PASC] and DSPI\_CTARx[ASC]. The minimum value is 2 cycles unless TSB mode or Continuous SCK clock mode is selected, in which case, M is automatically set to 0 clock cycles (PCS and SCK are driven by the same edge of DSPI\_CLKn).

<sup>7</sup> t<sub>SDC</sub> is only valid for even divide ratios. For odd divide ratios the fundamental duty cycle is not 50:50. For these odd divide ratios cases, the absolute spec number is applied as jitter/uncertainty to the nominal high time and low time.

<sup>8</sup> PCSx and PCSS using same pad configuration.

<sup>9</sup> Input timing assumes an input slew rate of 1 ns (10% – 90%) and uses TTL / Automotive voltage thresholds.

<sup>10</sup> SOUT Data Valid and Data hold are independent of load capacitance if SCK and SOUT load capacitances are the same value.

			Pad drive	Load	Min	Max		
8	t <sub>HI</sub>	CC	SIN Hold Time					
			SIN hold time from SCK CPHA = 0 <sup>6</sup>	SCK drive strength				
				LVDS	0 pF differential	-1 + (P <sup>7</sup> × t <sub>SYS</sub> <sup>3</sup> )	—	ns
			SIN hold time from SCK CPHA = 1 <sup>6</sup>	SCK drive strength				
				LVDS	0 pF differential	-1	—	ns
			9	t <sub>SUO</sub>	CC	SOUT data valid time (after SCK edge)		
SOUT data valid time from SCK CPHA = 0 <sup>8</sup>	SOUT and SCK drive strength							
	LVDS	15 pF to 25 pF differential				—	7.0 + t <sub>SYS</sub> <sup>3</sup>	ns
SOUT data valid time from SCK CPHA = 1 <sup>8</sup>	SOUT and SCK drive strength							
	LVDS	15 pF to 25 pF differential				—	7.0	ns
10	t <sub>HO</sub>	CC				SOUT data hold time (after SCK edge)		
			SOUT data hold time after SCK CPHA = 0 <sup>8</sup>	SOUT and SCK drive strength				
				LVDS	15 pF to 25 pF differential	-7.5 + t <sub>SYS</sub> <sup>3</sup>	—	ns
			SOUT data hold time after SCK CPHA = 1 <sup>8</sup>	SOUT and SCK drive strength				
				LVDS	15 pF to 25 pF differential	-7.5	—	ns

<sup>1</sup> All timing values for output signals in this table are measured to 50% of the output voltage.

<sup>2</sup> N is the number of clock cycles added to time between PCS assertion and SCK assertion and is software programmable using DSPI\_CTARx[PSSCK] and DSPI\_CTARx[CSSCK]. The minimum value is 2 cycles unless TSB mode or Continuous SCK clock mode is selected, in which case, N is automatically set to 0 clock cycles (PCS and SCK are driven by the same edge of DSPI\_CLKn).

<sup>3</sup>  $t_{SYS}$  is the period of DSPI\_CLKn clock, the input clock to the DSPI module. Maximum frequency is 100 MHz (min  $t_{SYS} = 10$  ns).

<sup>4</sup> M is the number of clock cycles added to time between SCK negation and PCS negation and is software programmable using DSPI\_CTARx[PASC] and DSPI\_CTARx[ASC]. The minimum value is 2 cycles unless TSB mode or Continuous SCK clock mode is selected, in which case, M is automatically set to 0 clock cycles (PCS and SCK are driven by the same edge of DSPI\_CLKn).

<sup>5</sup>  $t_{SDC}$  is only valid for even divide ratios. For odd divide ratios the fundamental duty cycle is not 50:50. For these odd divide ratios cases, the absolute spec number is applied as jitter/uncertainty to the nominal high time and low time.

<sup>6</sup> Input timing assumes an input slew rate of 1 ns (10% – 90%) and LVDS differential voltage =  $\pm 100$  mV.

<sup>7</sup> P is the number of clock cycles added to delay the DSPI input sample point and is software programmable using DSPI\_MCR[SMPL\_PT]. The value must be 0, 1 or 2. If the baud rate divide ratio is /2 or /3, this value is automatically set to 1.

- <sup>8</sup> SOUT Data Valid and Data hold are independent of load capacitance if SCK and SOUT load capacitances are the same value.

**Table 54. DSPI LVDS slave timing – full duplex – modified transfer format (MTFE = 0/1)<sup>1</sup>**

#	Symbol		Characteristic	Condition		Value		Unit
				Pad drive	Load	Min	Max	
1	t <sub>SCK</sub>	CC	SCK cycle time <sup>2</sup>	—	—	62	—	ns
2	t <sub>CSC</sub>	SR	$\overline{SS}$ to SCK delay <sup>2</sup>	—	—	16	—	ns
3	t <sub>ASC</sub>	SR	SCK to $\overline{SS}$ delay <sup>2</sup>	—	—	16	—	ns
4	t <sub>SDC</sub>	CC	SCK duty cycle <sup>2</sup>	—	—	30	—	ns
5	t <sub>A</sub>	CC	Slave Access Time <sup>2, 3, 4</sup> ( $\overline{SS}$ active to SOUT driven)	Very strong	25 pF	—	50	ns
				Strong	50 pF	—	50	ns
				Medium	50 pF	—	60	ns
6	t <sub>DIS</sub>	CC	Slave SOUT Disable Time <sup>2, 3, 4</sup> ( $\overline{SS}$ inactive to SOUT High-Z or invalid)	Very strong	25 pF	—	5	ns
				Strong	50 pF	—	5	ns
				Medium	50 pF	—	10	ns
7	t <sub>SUI</sub>	CC	Data setup time for inputs <sup>2</sup>	—	—	10	—	ns
8	t <sub>HI</sub>	CC	Data hold time for inputs <sup>2</sup>	—	—	10	—	ns
9	t <sub>SUO</sub>	CC	SOUT Valid Time <sup>2, 3, 4</sup> (after SCK edge)	Very strong	25 pF	—	30	ns
				Strong	50 pF	—	30	ns
				Medium	50 pF	—	50	ns
10	t <sub>HO</sub>	CC	SOUT Hold Time <sup>2, 3, 4</sup> (after SCK edge)	Very strong	25 pF	2.5	—	ns
				Strong	50 pF	2.5	—	ns
				Medium	50 pF	2.5	—	ns

<sup>1</sup> DSPI slave operation is only supported for a single master and single slave on the device. Timing is valid for that case only.

<sup>2</sup> Input timing assumes an input slew rate of 1 ns (10% - 90%) and uses TTL / Automotive voltage thresholds.

<sup>3</sup> All timing values for output signals in this table, are measured to 50% of the output voltage.

<sup>4</sup> All output timing is worst case and includes the mismatching of rise and fall times of the output pads.

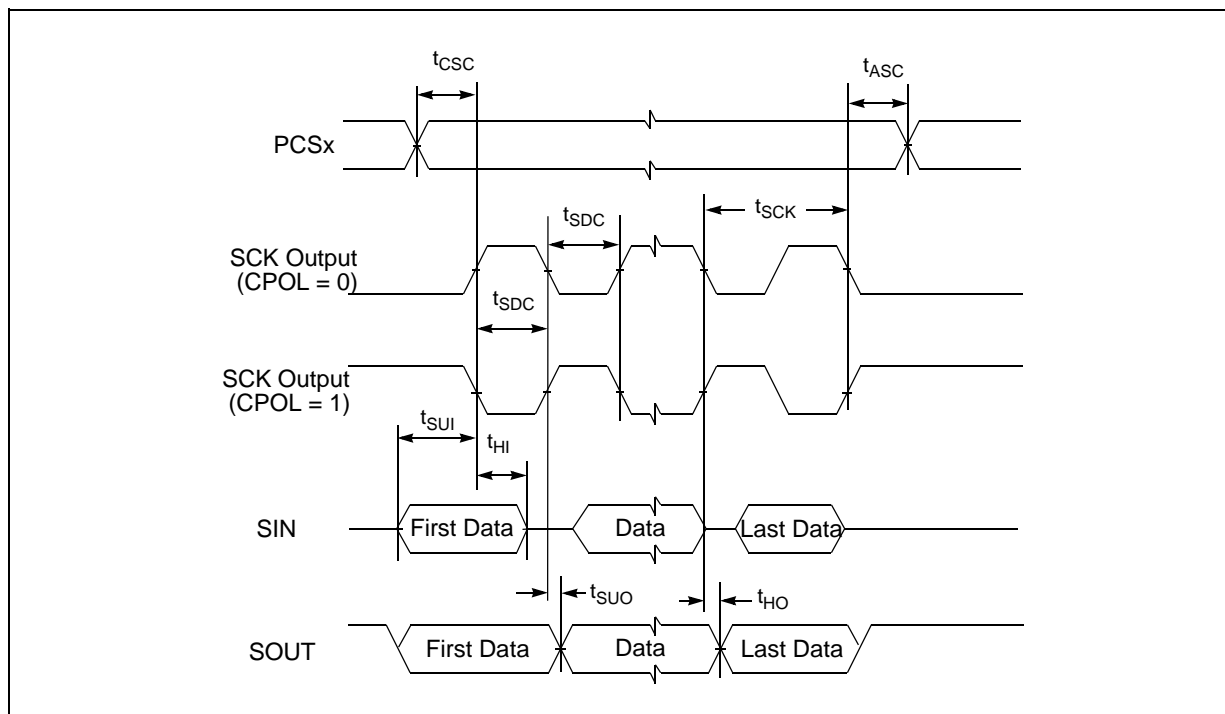

Figure 35. DSPI LVDS master mode – modified timing, CPHA = 0

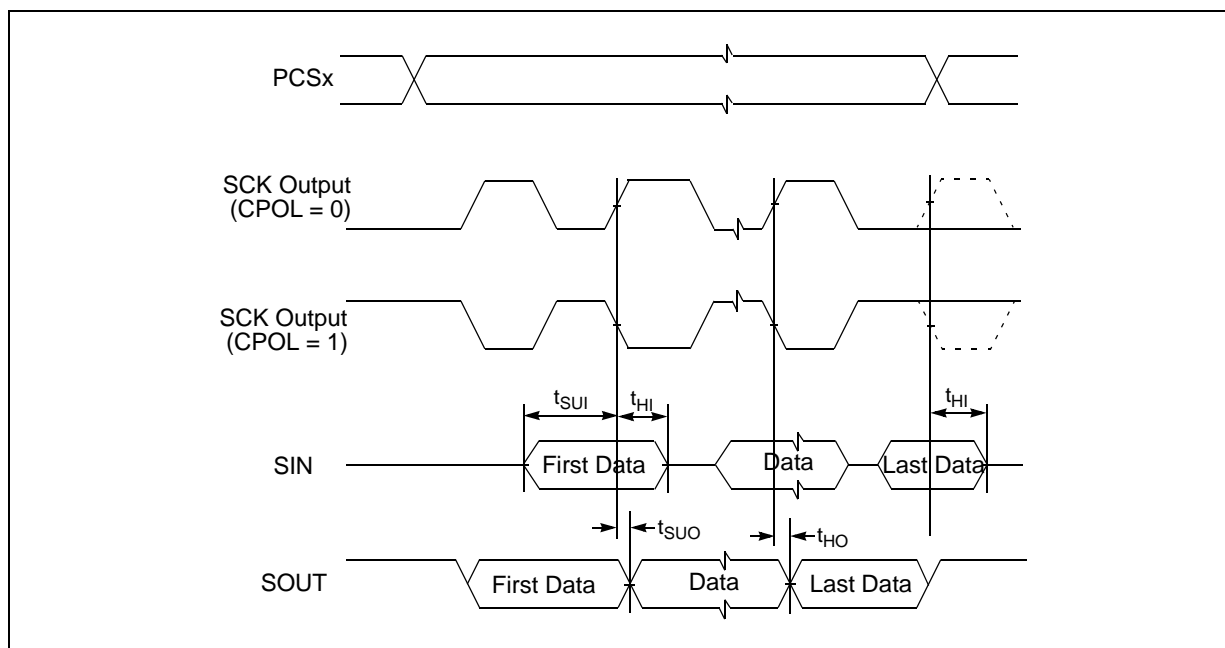

Figure 36. DSPI LVDS master mode – modified timing, CPHA = 1

### 3.16.2.1.4 DSPI Master Mode – Output Only

**Table 55. DSPI LVDS master timing – output only – timed serial bus mode TSB = 1 or ITSB = 1, CPOL = 0 or 1, continuous SCK clock<sup>1,2</sup>**

#	Symbol		Characteristic	Condition		Value		Unit
				Pad drive	Load	Min	Max	
1	t <sub>SCK</sub>	CC	SCK cycle time	LVDS	15 pF to 50 pF differential	25.0	—	ns
2	t <sub>CSV</sub>	CC	PCS valid after SCK <sup>3</sup> (SCK with 50 pF differential load cap.)	Very strong	25 pF	—	6.0	ns
				Strong	50 pF	—	10.5	ns
3	t <sub>CSH</sub>	CC	PCS hold after SCK <sup>3</sup> (SCK with 50 pF differential load cap.)	Very strong	0 pF	−4.0	—	ns
				Strong	0 pF	−4.0	—	ns
4	t <sub>SDC</sub>	CC	SCK duty cycle (SCK with 50 pF differential load cap.)	LVDS	15 pF to 50 pF differential	<sup>1</sup> / <sub>2</sub> t <sub>SCK</sub> − 2	<sup>1</sup> / <sub>2</sub> t <sub>SCK</sub> + 2	ns
SOUT data valid time (after SCK edge)								
5	t <sub>SUO</sub>	CC	SOUT data valid time from SCK <sup>4</sup>	SOUT and SCK drive strength				
				LVDS	15 pF to 50 pF differential	—	3.5	ns
SOUT data hold time (after SCK edge)								
6	t <sub>HO</sub>	CC	SOUT data hold time after SCK <sup>4</sup>	SOUT and SCK drive strength				
				LVDS	15 pF to 50 pF differential	−3.5	—	ns

<sup>1</sup> All DSPI timing specifications apply to pins when using LVDS pads for SCK and SOUT and CMOS pad for PCS with pad driver strength as defined. Timing may degrade for weaker output drivers.

<sup>2</sup> TSB = 1 or ITSB = 1 automatically selects MTFE = 1 and CPHA = 1.

<sup>3</sup> With TSB mode or Continuous SCK clock mode selected, PCS and SCK are driven by the same edge of DSPI\_CLKn. This timing value is due to pad delays and signal propagation delays.

<sup>4</sup> SOUT Data Valid and Data hold are independent of load capacitance if SCK and SOUT load capacitances are the same value.

**Table 56. DSPI CMOS master timing – output only – timed serial bus mode TSB = 1 or ITSB = 1, CPOL = 0 or 1, continuous SCK clock<sup>1,2</sup>**

#	Symbol		Characteristic	Condition		Value <sup>3</sup>		Unit
				Pad drive <sup>4</sup>	Load (C <sub>L</sub> )	Min	Max	
1	t <sub>SCK</sub>	CC	SCK cycle time	SCK drive strength				
				Very strong	25 pF	33.0	—	ns
				Strong	50 pF	80.0	—	ns
				Medium	50 pF	200.0	—	ns

Table 56. DSPI CMOS master timing – output only – timed serial bus mode TSB = 1 or ITSB = 1, CPOL = 0 or 1, continuous SCK clock<sup>1,2</sup> (continued)

#	Symbol		Characteristic	Condition		Value <sup>3</sup>		Unit
				Pad drive <sup>4</sup>	Load (C <sub>L</sub> )	Min	Max	
2	t <sub>CSV</sub>	CC	PCS valid after SCK <sup>5</sup>	SCK and PCS drive strength				
				Very strong	25 pF	7	—	ns
				Strong	50 pF	8	—	ns
				Medium	50 pF	16	—	ns
				PCS medium and SCK strong	PCS = 50 pF SCK = 50 pF	29	—	ns

				Very strong	PCS = 0 pF SCK = 50 pF	–14	—	ns
				Strong	PCS = 0 pF SCK = 50 pF	–14	—	ns
				Medium	PCS = 0 pF SCK = 50 pF	–33	—	ns
				PCS medium and SCK strong	PCS = 0 pF SCK = 50 pF	–35	—	ns
4	t <sub>SDC</sub>	CC	SCK duty cycle <sup>6</sup>	SCK drive strength				
				Very strong	0 pF	$\frac{1}{2}t_{SCK} - 2$	$\frac{1}{2}t_{SCK} + 2$	ns
				Strong	0 pF	$\frac{1}{2}t_{SCK} - 2$	$\frac{1}{2}t_{SCK} + 2$	ns
				Medium	0 pF	$\frac{1}{2}t_{SCK} - 5$	$\frac{1}{2}t_{SCK} + 5$	ns
SOUT data valid time (after SCK edge)								
9	t <sub>SUO</sub>	CC	SOUT data valid time from SCK CPHA = 1 <sup>7</sup>	SOUT and SCK drive strength				
				Very strong	25 pF	—	7.0	ns
				Strong	50 pF	—	8.0	ns
				Medium	50 pF	—	16.0	ns
SOUT data hold time (after SCK edge)								
10	t <sub>HO</sub>	CC	SOUT data hold time after SCK CPHA = 1 <sup>7</sup>	SOUT and SCK drive strength				
				Very strong	25 pF	–7.7	—	ns
				Strong	50 pF	–11.0	—	ns
				Medium	50 pF	–15.0	—	ns

<sup>1</sup> TSB = 1 or ITSB = 1 automatically selects MTFE = 1 and CPHA = 1.

<sup>2</sup> All output timing is worst case and includes the mismatching of rise and fall times of the output pads.

<sup>3</sup> All timing values for output signals in this table are measured to 50% of the output voltage.

<sup>4</sup> Timing is guaranteed to same drive capabilities for all signals, mixing of pad drives may reduce operating speeds and may cause incorrect operation.

<sup>5</sup> With TSB mode or Continuous SCK clock mode selected, PCS and SCK are driven by the same edge of DSPI\_CLKn. This timing value is due to pad delays and signal propagation delays.

- <sup>6</sup>  $t_{SDC}$  is only valid for even divide ratios. For odd divide ratios the fundamental duty cycle is not 50:50. For these odd divide ratios cases, the absolute spec number is applied as jitter/uncertainty to the nominal high time and low time.
- <sup>7</sup> SOUT Data Valid and Data hold are independent of load capacitance if SCK and SOUT load capacitances are the same value.

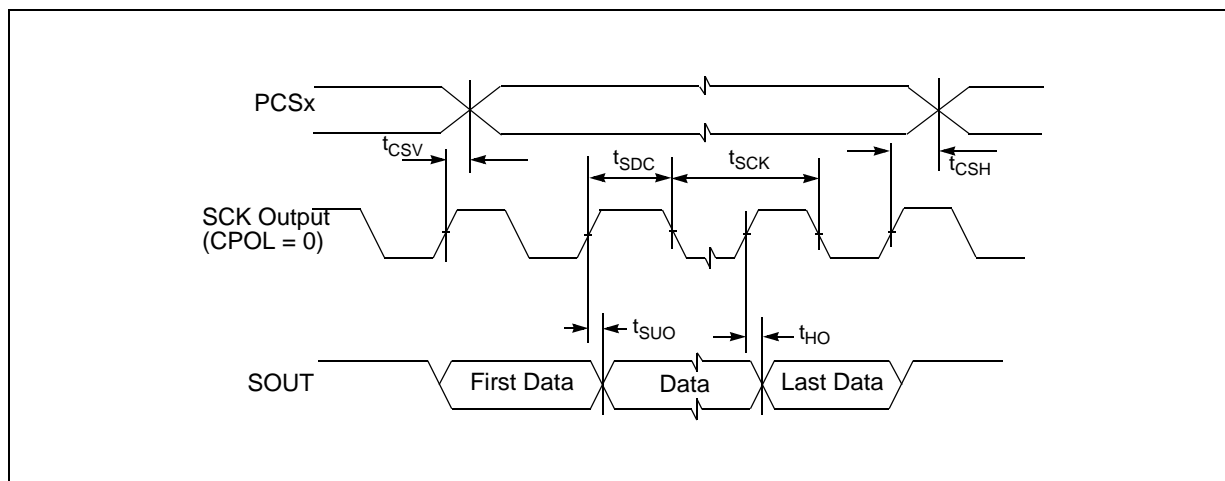

Figure 37. DSPI LVDS and CMOS master timing – output only – modified transfer format MTFE = 1, CHPA = 1

### 3.16.2.2 Slave Mode timing

Table 57. DSPI CMOS Slave timing - Modified Transfer Format (MTFE = 0/1)<sup>1</sup>

#	Symbol		Characteristic	Condition		Min	Max	Unit
				Pad Drive	Load			
1	t <sub>SCK</sub>	CC	SCK Cycle Time <sup>2</sup>	-	-	62	—	ns
2	t <sub>CSC</sub>	SR	$\overline{SS}$ to SCK Delay <sup>2</sup>	-	-	16	—	ns
3	t <sub>ASC</sub>	SR	SCK to $\overline{SS}$ Delay <sup>2</sup>	-	-	16	—	ns
4	t <sub>SDC</sub>	CC	SCK Duty Cycle <sup>2</sup>	-	-	30	—	ns
5	t <sub>A</sub>	CC	$\overline{Slave\ Access\ Time}^{2,3,4}$ ( $\overline{SS}$ active to SOUT driven)	Very Strong	25 pF	—	50	ns
				Strong	50 pF	—	50	ns
				Medium	50 pF	—	60	ns
6	t <sub>DIS</sub>	CC	$\overline{Slave\ SOUT\ Disable\ Time}^{2,3,4}$ ( $\overline{SS}$ inactive to SOUT High-Z or invalid)	Very Strong	25 pF	—	5	ns
				Strong	50 pF	—	5	ns
				Medium	50 pF	—	10	ns
9	t <sub>SUI</sub>	CC	Data Setup Time for Inputs <sup>2</sup>	—	—	10	—	ns
10	t <sub>HI</sub>	CC	Data Hold Time for Inputs <sup>2</sup>	—	—	10	—	ns

**Table 57. DSPI CMOS Slave timing - Modified Transfer Format (MTFE = 0/1)<sup>1</sup>**

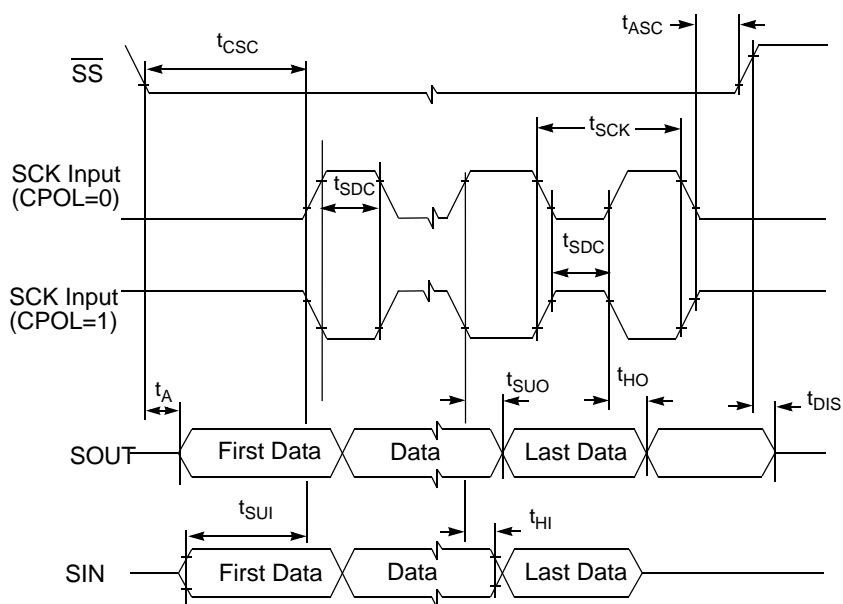

#	Symbol		Characteristic	Condition		Min	Max	Unit
				Pad Drive	Load			
11	t <sub>SUO</sub>	CC	SOUT Valid Time <sup>2,3,4</sup> (after SCK edge)	Very Strong	25 pF	—	30	ns
				Strong	50 pF	—	30	ns
				Medium	50 pF	—	50	ns
12	t <sub>HO</sub>	CC	SOUT Hold Time <sup>2,3,4</sup> (after SCK edge)	Very Strong	25 pF	2.5	—	ns
				Strong	50 pF	2.5	—	ns
				Medium	50 pF	2.5	—	ns

<sup>1</sup> DSPI slave operation is only supported for a single master and single slave on the device. Timing is valid for that case only.

<sup>2</sup> Input timing assumes an input slew rate of 1 ns (10% - 90%) and uses TTL / Automotive voltage thresholds.

<sup>3</sup> All timing values for output signals in this table, are measured to 50% of the output voltage.

<sup>4</sup> All output timing is worst case and includes the mismatching of rise and fall times of the output pads.

**Figure 38. DSPI Slave Mode - Modified transfer format timing (MFTE = 0/1) — CPHA = 0**

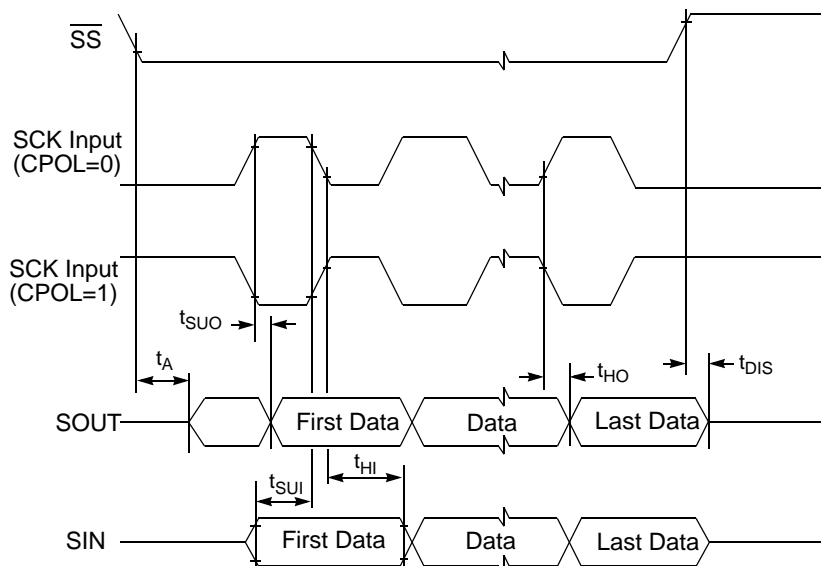

Figure 39. DSPI Slave Mode - Modified transfer format timing (MFTE = 0/1) — CPHA = 1

### 3.16.3 FEC timing

The FEC provides both MII and RMI interfaces in the 416 TEPBGA and 512 TEPBGA packages, and the MII and RMI signals can be configured for either CMOS or TTL signal levels compatible with devices operating at either 5.0 V or 3.3 V.

#### 3.16.3.1 MII receive signal timing (RXD[3:0], RX\_DV, RX\_ER, and RX\_CLK)

The receiver functions correctly up to a RX\_CLK maximum frequency of 25 MHz +1%. There is no minimum frequency requirement. The system clock frequency must be at least equal to or greater than the RX\_CLK frequency.

Table 58. MII receive signal timing<sup>1</sup>

Symbol		Characteristic	Value		Unit
			Min	Max	
M1	CC	RXD[3:0], RX_DV, RX_ER to RX_CLK setup	5	—	ns
M2	CC	RX_CLK to RXD[3:0], RX_DV, RX_ER hold	5	—	ns
M3	CC	RX_CLK pulse width high	35%	65%	RX_CLK period
M4	CC	RX_CLK pulse width low	35%	65%	RX_CLK period

<sup>1</sup> All timing specifications are referenced from RX\_CLK = 1.4 V to the valid input levels, 0.8 V and 2.0 V.

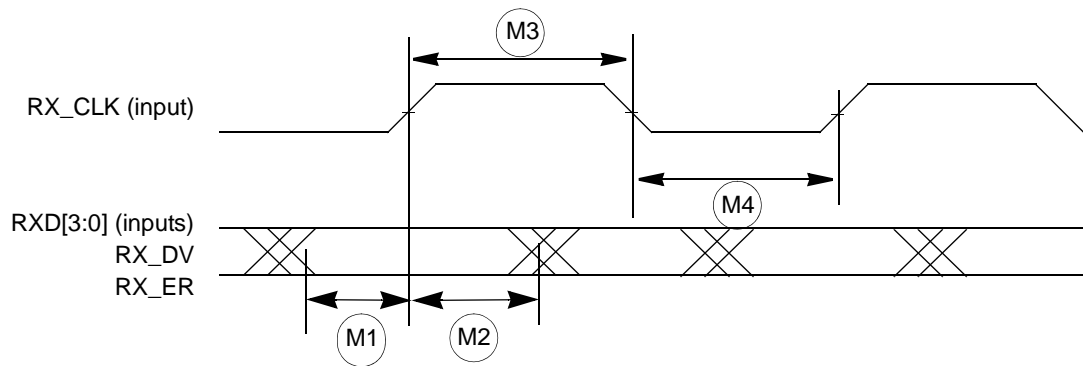

Figure 40. MII receive signal timing diagram

### 3.16.3.2 MII transmit signal timing (TXD[3:0], TX\_EN, TX\_ER, TX\_CLK)

The transmitter functions correctly up to a TX\_CLK maximum frequency of 25 MHz +1%. There is no minimum frequency requirement. The system clock frequency must be at least equal to or greater than the TX\_CLK frequency.

The transmit outputs (TXD[3:0], TX\_EN, TX\_ER) can be programmed to transition from either the rising or falling edge of TX\_CLK, and the timing is the same in either case. This options allows the use of non-compliant MII PHYs.

Refer to the *MPC5777M Microcontroller Reference Manual's* Fast Ethernet Controller (FEC) chapter for details of this option and how to enable it.

Table 59. MII transmit signal timing<sup>1</sup>

Symbol		Characteristic	Value <sup>2</sup>		Unit
			Min	Max	
M5	CC	TX_CLK to TXD[3:0], TX_EN, TX_ER invalid	5	—	ns
M6	CC	TX_CLK to TXD[3:0], TX_EN, TX_ER valid	—	25	ns
M7	CC	TX_CLK pulse width high	35%	65%	TX_CLK period
M8	CC	TX_CLK pulse width low	35%	65%	TX_CLK period

<sup>1</sup> All timing specifications are referenced from TX\_CLK = 1.4 V to the valid output levels, 0.8 V and 2.0 V.

<sup>2</sup> Output parameters are valid for C<sub>L</sub> = 25 pF, where C<sub>L</sub> is the external load to the device. The internal package capacitance is accounted for, and does not need to be subtracted from the 25 pF value.

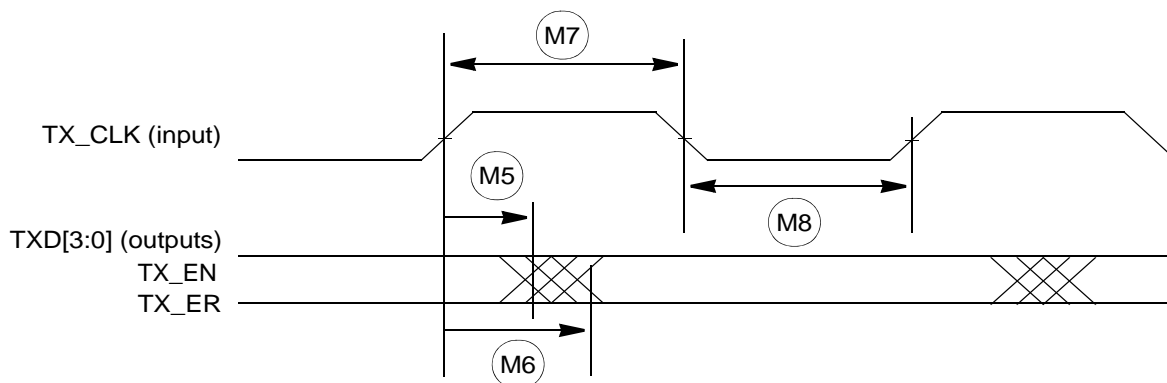

Figure 41. MII transmit signal timing diagram

### 3.16.3.3 MII async inputs signal timing (CRS and COL)

Table 60. MII async inputs signal timing

Symbol		Characteristic	Value		Unit
			Min	Max	
M9	CC	CRS, COL minimum pulse width	1.5	—	TX_CLK period

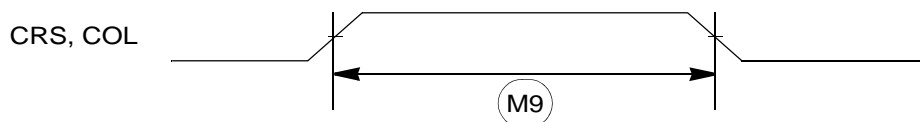

Figure 42. MII async inputs timing diagram

### 3.16.3.4 MII and RMI serial management channel timing (MDIO and MDC)

The FEC functions correctly with a maximum MDC frequency of 2.5 MHz.

Table 61. MII serial management channel timing<sup>1</sup>

Symbol		Characteristic	Value <sup>2</sup>		Unit
			Min	Max	
M10	CC	MDC falling edge to MDIO output invalid (minimum propagation delay)	0	—	ns
M11	CC	MDC falling edge to MDIO output valid (max prop delay)	—	25	ns
M12	CC	MDIO (input) to MDC rising edge setup	10	—	ns
M13	CC	MDIO (input) to MDC rising edge hold	0	—	ns
M14	CC	MDC pulse width high	40%	60%	MDC period
M15	CC	MDC pulse width low	40%	60%	MDC period

<sup>1</sup> All timing specifications are referenced from MDC = 1.4 V (TTL levels) to the valid input and output levels, 0.8 V and 2.0 V (TTL levels). For 5 V operation, timing is referenced from MDC = 50% to 2.2 V/3.5 V input and output levels.

# Electrical characteristics

<sup>2</sup> Output parameters are valid for  $C_L = 25$  pF, where  $C_L$  is the external load to the device. The internal package capacitance is accounted for, and does not need to be subtracted from the 25 pF value.

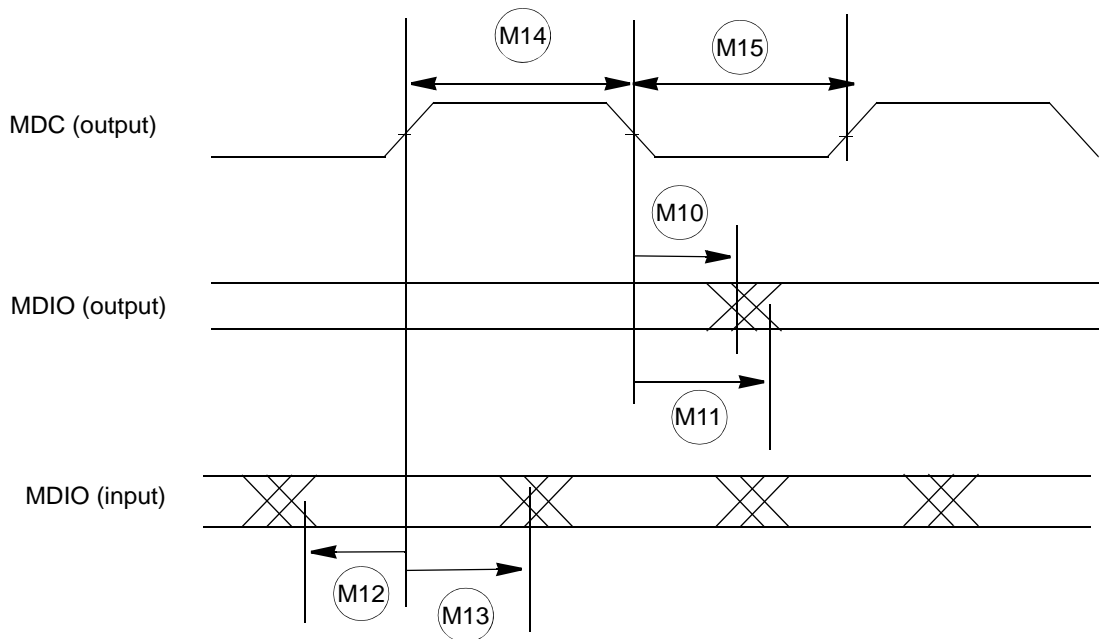

Figure 43. MII serial management channel timing diagram

## 3.16.3.5 RMII receive signal timing (RXD[1:0], CRS\_DV)

The receiver functions correctly up to a REF\_CLK maximum frequency of 50 MHz +1%. There is no minimum frequency requirement. The system clock frequency must be at least equal to or greater than the RX\_CLK frequency, which is half that of the REF\_CLK frequency.

Table 62. RMII receive signal timing<sup>1</sup>

Symbol	Characteristic	Value		Unit
		Min	Max	
R1	CC RXD[1:0], CRS_DV to REF_CLK setup	4	—	ns
R2	CC REF_CLK to RXD[1:0], CRS_DV hold	2	—	ns
R3	CC REF_CLK pulse width high	35%	65%	REF_CLK period
R4	CC REF_CLK pulse width low	35%	65%	REF_CLK period

<sup>1</sup> All timing specifications are referenced from REF\_CLK = 1.4 V to the valid input levels, 0.8 V and 2.0 V.

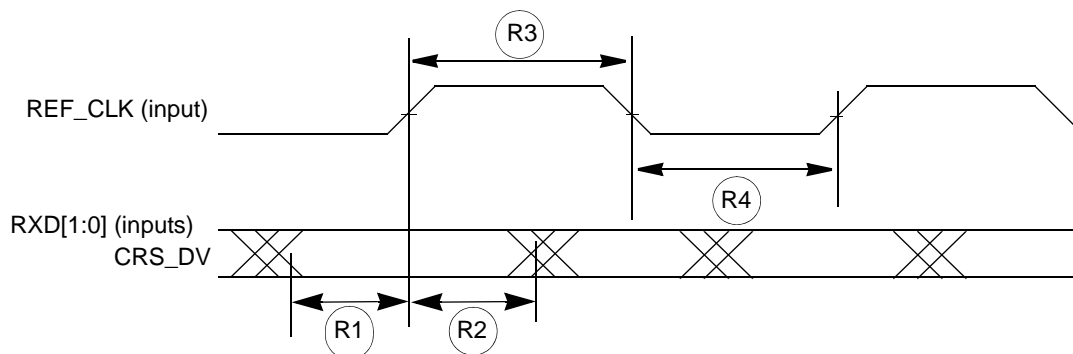

Figure 44. RMII receive signal timing diagram

### 3.16.3.6 RMII transmit signal timing (TXD[1:0], TX\_EN)

The transmitter functions correctly up to a REF\_CLK maximum frequency of 50 MHz + 1%. There is no minimum frequency requirement. The system clock frequency must be at least equal to or greater than the TX\_CLK frequency, which is half that of the REF\_CLK frequency.

The transmit outputs (TXD[1:0], TX\_EN) can be programmed to transition from either the rising or falling edge of REF\_CLK, and the timing is the same in either case. These options allows the use of non-compliant RMII PHYs.

Table 63. RMII transmit signal timing<sup>1, 2</sup>

Symbol		Characteristic	Value <sup>3</sup>		Unit
			Min	Max	
R5	CC	REF_CLK to TXD[1:0], TX_EN invalid	2	—	ns
R6	CC	REF_CLK to TXD[1:0], TX_EN valid	—	16	ns
R7	CC	REF_CLK pulse width high	35%	65%	REF_CLK period
R8	CC	REF_CLK pulse width low	35%	65%	REF_CLK period

<sup>1</sup> RMII timing is valid only up to a maximum of 150 °C junction temperature.

<sup>2</sup> All timing specifications are referenced for TTL or CMOS input levels for REF\_CLK to the valid output levels, 0.8 V and 2.0 V.

<sup>3</sup> Output parameters are valid for  $C_L = 25$  pF, where  $C_L$  is the external load to the device. The internal package capacitance is accounted for, and does not need to be subtracted from the 25 pF value.

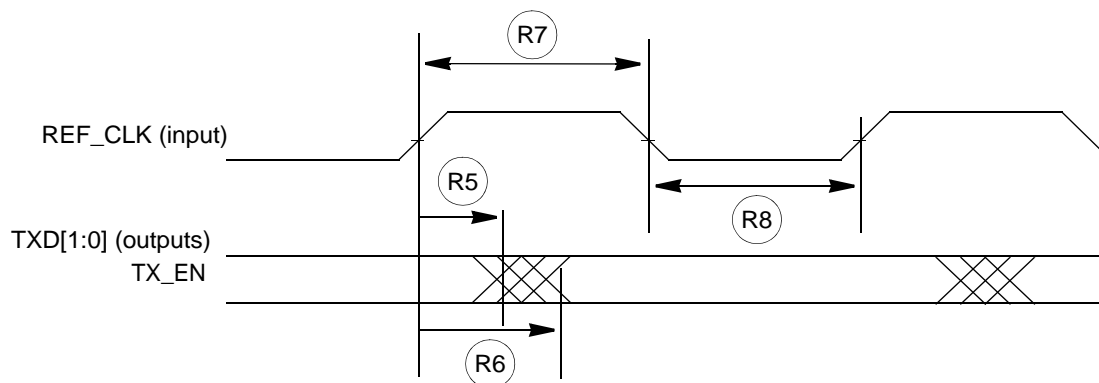

Figure 45. RMII transmit signal timing diagram

### 3.16.4 FlexRay timing

This section provides the FlexRay Interface timing characteristics for the input and output signals. These are recommended numbers as per the FlexRay EPL v3.0 specification.

#### 3.16.4.1 TxEN

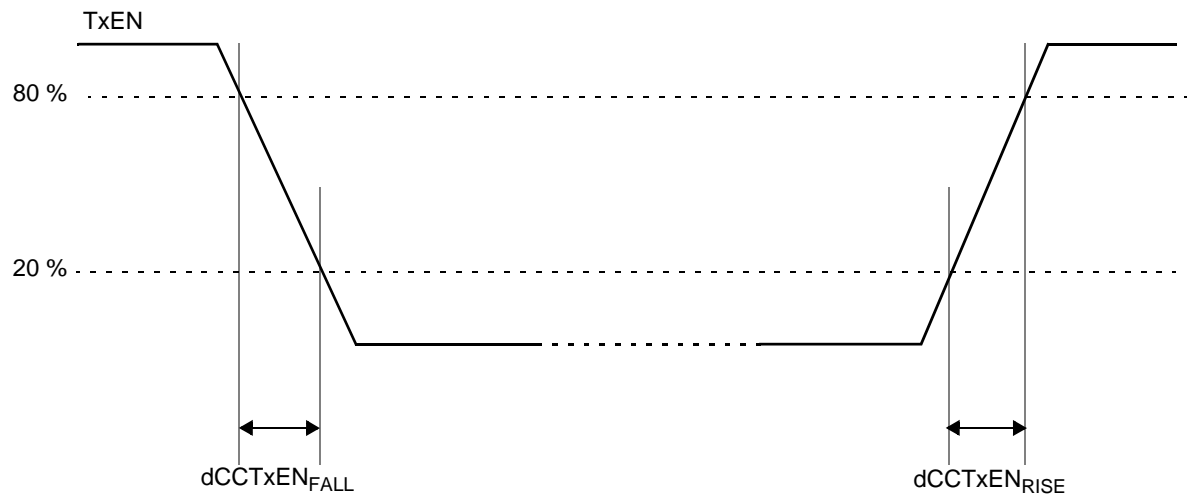

Figure 46. TxEN signal

Table 64. TxEN output characteristics<sup>1</sup>

Symbol		Characteristic	Value		Unit
			Min	Max	
dCCTxEN <sub>RISE25</sub>	CC	Rise time of TxEN signal at CC	—	9	ns
dCCTxEN <sub>FALL25</sub>	CC	Fall time of TxEN signal at CC	—	9	ns
dCCTxEN <sub>01</sub>	CC	Sum of delay between Clk to Q of the last FF and the final output buffer, rising edge	—	25	ns
dCCTxEN <sub>10</sub>	CC	Sum of delay between Clk to Q of the last FF and the final output buffer, falling edge	—	25	ns

<sup>1</sup> TxEN pin load maximum 25 pF

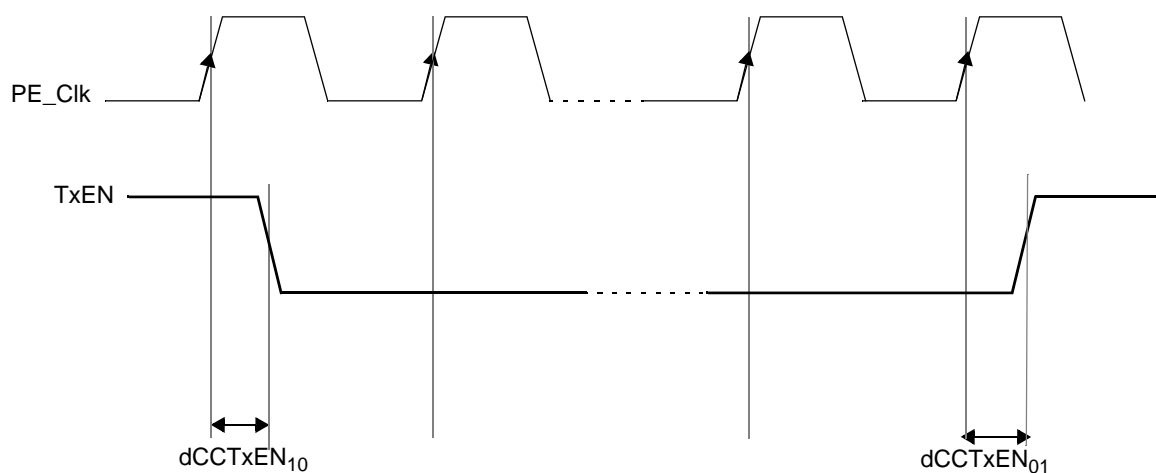

Figure 47. TxEN signal propagation delays

### 3.16.4.2 TxD

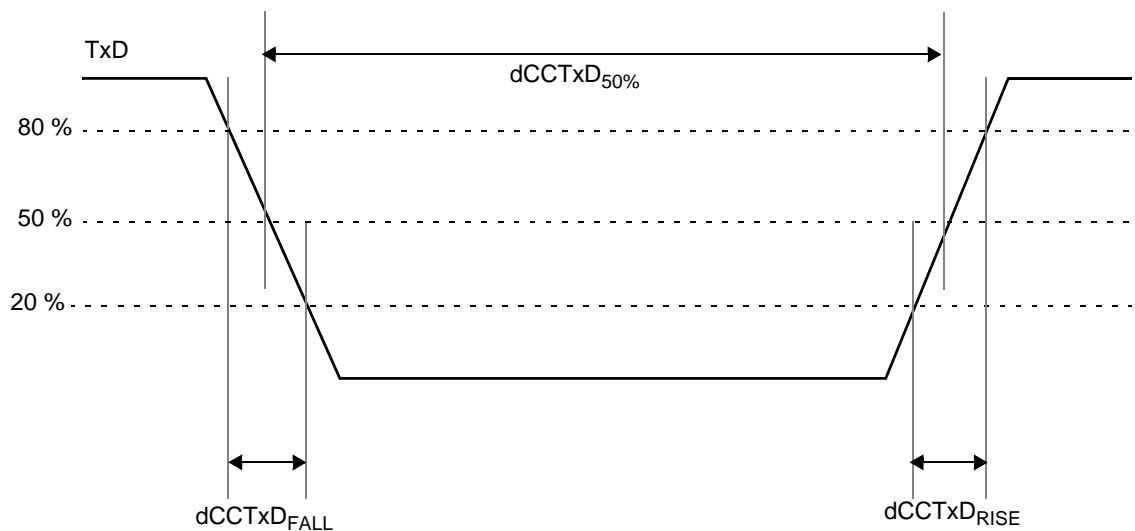

Figure 48. TxD signal

Table 65. TxD output characteristics<sup>1,2</sup>

Symbol	Characteristic	Value		Unit
		Min	Max	
dCCTxAsym	CC Asymmetry of sending CC at 25 pF load (= dCCTxD <sub>50%</sub> – 100 ns)	–2.45	2.45	ns
dCCTxD <sub>RISE25</sub> +dCCTxD <sub>FALL25</sub>	CC Sum of Rise and Fall time of TxD signal at the output pin <sup>3,4</sup>	—	g <sup>5</sup>	ns
		—	g <sup>6</sup>	
dCCTxD <sub>01</sub>	CC Sum of delay between Clk to Q of the last FF and the final output buffer, rising edge	—	25	ns
dCCTxD <sub>10</sub>	CC Sum of delay between Clk to Q of the last FF and the final output buffer, falling edge	—	25	ns

<sup>1</sup> TxD pin load maximum 25 pF

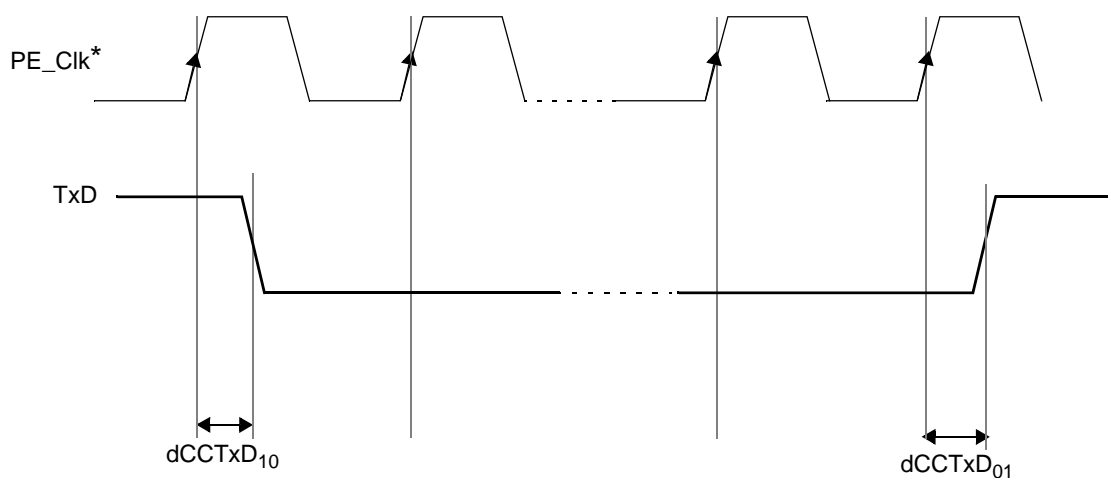

<sup>2</sup> Specifications valid according to FlexRay EPL 3.0.1 standard with 20%–80% levels and a 10pF load at the end of a 50 Ohm, 1 ns stripline. Please refer to the Very Strong I/O pad specifications.

<sup>3</sup> Pad configured as VERY STRONG

<sup>4</sup> Sum of transition time simulation is performed according to Electrical Physical Layer Specification 3.0.1 and the entire temperature range of the device has been taken into account.

<sup>5</sup> V<sub>DD\_HV\_IO</sub> = 5.0 V ± 10%, Transmission line Z = 50 ohms, t<sub>delay</sub> = 1 ns, C<sub>L</sub> = 10 pF

<sup>6</sup> V<sub>DD\_HV\_IO</sub> = 3.3 V ± 10%, Transmission line Z = 50 ohms, t<sub>delay</sub> = 0.6 ns, C<sub>L</sub> = 10 pF

\* FlexRay Protocol Engine Clock

Figure 49. TxD Signal propagation delays

### 3.16.4.3 RxD

Table 66. RxD input characteristics<sup>1</sup>

Symbol		Characteristic	Value		Unit
			Min	Max	
C_CCRxD	CC	Input capacitance on RxD pin	—	7	pF
uCCLogic_1	CC	Threshold for detecting logic high	35	70	%
uCCLogic_0	CC	Threshold for detecting logic low	30	65	%
dCCRxD <sub>01</sub>	CC	Sum of delay from actual input to the D input of the first FF, rising edge	—	10	ns
dCCRxD <sub>10</sub>	CC	Sum of delay from actual input to the D input of the first FF, falling edge	—	10	ns
dCCRxAsymAccept15	CC	Acceptance of asymmetry at receiving CC with 15 pF load	−31.5	44	ns
dCCRxAsymAccept25	CC	Acceptance of asymmetry at receiving CC with 25 pF load	−30.5	43	ns

<sup>1</sup> FlexRay RxD timing is valid for Automotive input levels with hysteresis enabled (hysteresis permanently enabled in Automotive input levels) and CMOS input levels with hysteresis disabled,  $4.5\text{ V} \leq V_{DD\_HV\_IO} \leq 5.5\text{ V}$  for both cases.

### 3.16.5 PSI5 timing

The following table describes the PSI5 timing.

Table 67. PSI5 timing

Symbol		Parameter	Value		Unit
			Min	Max	
t <sub>MSG_DLY</sub>	CC	Delay from last bit of frame (CRC0) to assertion of new message received interrupt	—	3	μs
t <sub>SYNC_DLY</sub>	CC	Delay from internal sync pulse to sync pulse trigger at the SDOUT_PSI5_n pin	—	2	μs
t <sub>MSG_JIT</sub>	CC	Delay jitter from last bit of frame (CRC0) to assertion of new message received interrupt	—	1	cycles <sup>1</sup>
t <sub>SYNC_JIT</sub>	CC	Delay jitter from internal sync pulse to sync pulse trigger at the SDOUT_PSI5_n pin	—	±(1 PSI5_1μs_CLK + 1 PBRIDGE <sub>n</sub> _CLK)	cycles

<sup>1</sup> Measured in PSI5 clock cycles (PBRIDGE<sub>n</sub>\_CLK on the device). Minimum PSI5 clock period is 20 ns.

### 3.16.6 UART timing

UART channel frequency support is shown in the following table.

Table 68. UART frequency support

LINFlexD clock frequency LIN_CLK (MHz)	Oversampling rate	Voting scheme	Max usable frequency (Mbaud)
80	16	3:1 majority voting	5
	8		10
	6	Limited voting on one sample with configurable sampling point	13.33
	5		16
	4		20
100	16	3:1 majority voting	6.25
	8		12.5
	6	Limited voting on one sample with configurable sampling point	16.67
	5		20
	4		25

### 3.16.7 External Bus Interface (EBI) Timing

Table 69. Bus Operation Timing<sup>1</sup>

Spec	Characteristic	Symbol	66.7 MHz (Ext. Bus Freq) <sup>2 3</sup>		Unit
			Min	Max	
1	CLKOUT Period <sup>4</sup>	$t_C$	15.15	—	ns
2	CLKOUT Duty Cycle	$t_{CDC}$	45%	55%	$t_C$
3	CLKOUT Rise Time	$t_{CRT}$	—	— <sup>5</sup>	ns
4	CLKOUT Fall Time	$t_{CFT}$	—	— <sup>5</sup>	ns
5	CLKOUT Posedge to Output Signal Invalid or High Z (Hold Time) <sup>6</sup>  ADDR[12:31] ADDR[8:11]/WE[0:3]/BE[0:3] BDIP CS[0:3] DATA[0:31] OE RD_WR TS	$t_{COH}$	1.0	—	ns
6	CLKOUT Posedge to Output Signal Valid (Output Delay) <sup>7,8</sup>  ADDR[12:31] ADDR[8:11]/WE[0:3]/BE[0:3] BDIP CS[0:3] DATA[0:31] OE RD_WR TS	$t_{COV}$	—	8.0	ns

Table 69. Bus Operation Timing<sup>1</sup> (continued)

Spec	Characteristic	Symbol	66.7 MHz (Ext. Bus Freq) <sup>2 3</sup>		Unit
			Min	Max	
7	Input Signal Valid to CLKOUT Posedge (Setup Time) DATA[0:31]	$t_{CIS}$	7.0	—	ns
8	CLKOUT Posedge to Input Signal Invalid (Hold Time) DATA[0:31]	$t_{CIH}$	1.0	—	ns

<sup>1</sup> EBI timing specified at  $V_{DD\_HV\_IO\_EBI}$  and  $V_{DD\_HV\_IO\_FLEXE} = 3.0\text{ V}$  to  $3.6\text{ V}$ ,  $T_A = T_L$  to  $T_H$ , and  $C_L = 30\text{ pF}$  with  $DSC = 0b10$  for ADDR/CTRL and  $DSC = 0b11$  for CLKOUT/DATA.

<sup>2</sup> Speed is the nominal maximum frequency. Max speed is the maximum speed allowed including PLL jitter.

<sup>3</sup> Depending on the internal bus speed, set the CGM\_SC\_DC4 register bits correctly not to exceed maximum external bus frequency. The maximum external bus frequency is 66.7 MHz.

<sup>4</sup> Signals are measured at 50%  $V_{DD\_HV\_IO\_EBI}$  or  $V_{DD\_HV\_IO\_FLEXE}$ .

<sup>5</sup> Refer to Fast pad timing in Table 18.

<sup>6</sup> CLKOUT may be required at the highest drive strength in order to meet the hold time specification.

<sup>7</sup> One wait state must be added for all write accesses to external memories at the maximum external bus frequency.

<sup>8</sup> One wait state must be added to the output signal valid delay for external writes.

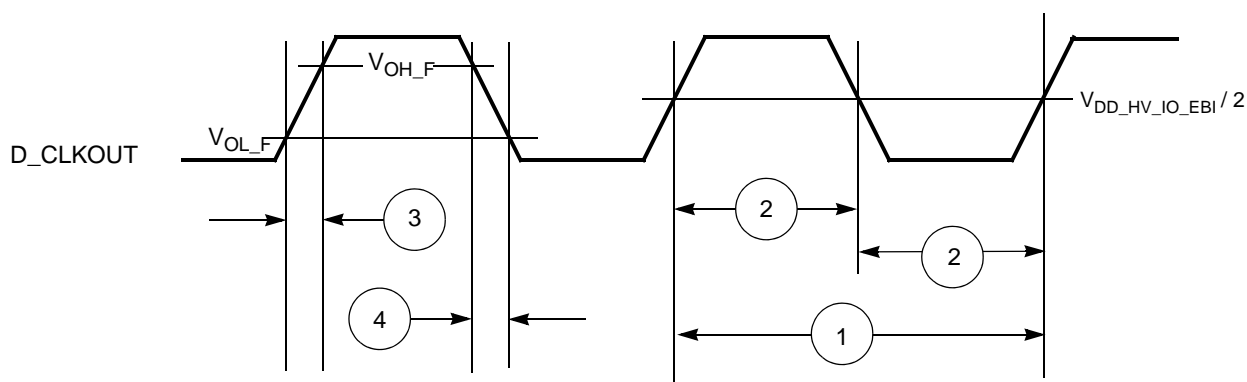

Figure 50. D\_CLKOUT Timing

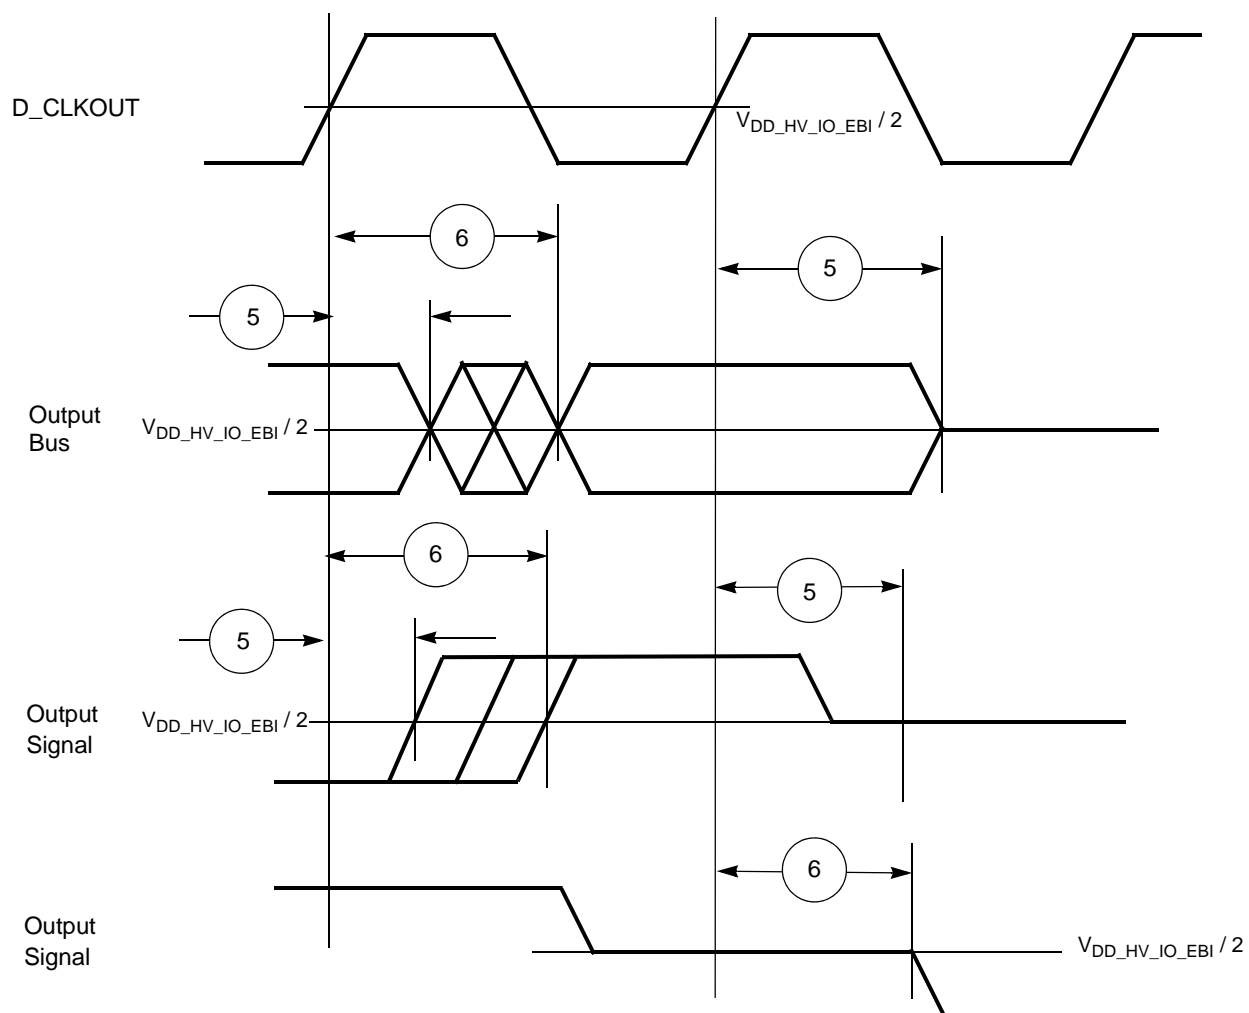

Figure 51. Synchronous Output Timing

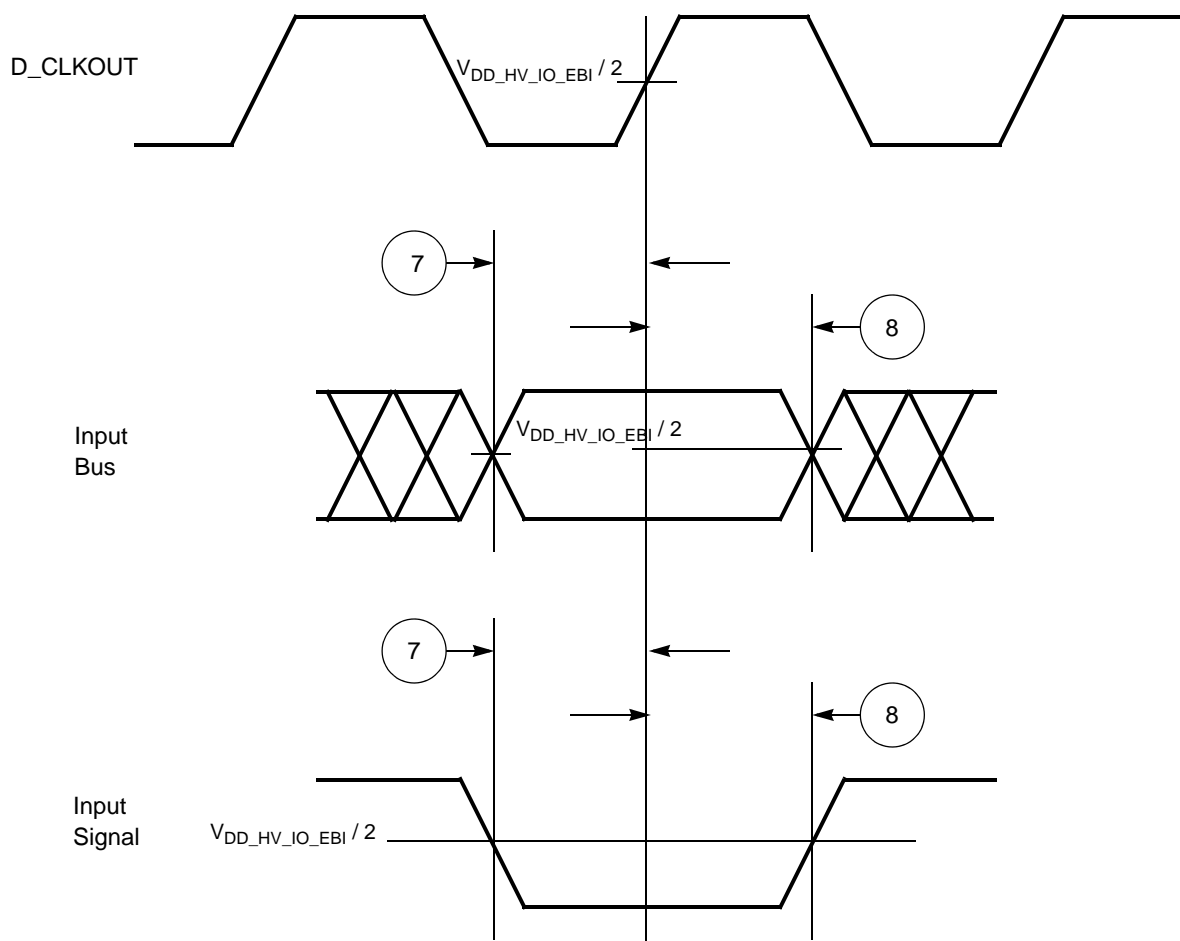

Figure 52. Synchronous Input Timing

### 3.16.8 I<sup>2</sup>C timing

The I<sup>2</sup>C AC timing specifications are provided in the following tables.

**Table 70. I<sup>2</sup>C input timing specifications — SCL and SDA<sup>1</sup>**

No.	Symbol	Parameter	Value		Unit
			Min	Max	
1	—	CC Start condition hold time	2	—	PER_CLK Cycle <sup>2</sup>
2	—	CC Clock low time	8	—	PER_CLK Cycle
3	—	CC Bus free time between Start and Stop condition	4.7	—	μs
4	—	CC Data hold time	0.0	—	ns

Table 70. I<sup>2</sup>C input timing specifications — SCL and SDA<sup>1</sup> (continued)

No.	Symbol	Parameter	Value		Unit
			Min	Max	
5	—	CC Clock high time	4	—	PER_CLK Cycle
6	—	CC Data setup time	0.0	—	ns
7	—	CC Start condition setup time (for repeated start condition only)	2	—	PER_CLK Cycle
8	—	CC Stop condition setup time	2	—	PER_CLK Cycle

<sup>1</sup> I<sup>2</sup>C input timing is valid for Automotive and TTL inputs levels, hysteresis enabled, and an input edge rate no slower than 1 ns (10% – 90%).

<sup>2</sup> PER\_CLK is the SoC peripheral clock, which drives the I<sup>2</sup>C BIU and module clock inputs. See the Clocking chapter in the device reference manual for more detail.

Table 71. I<sup>2</sup>C output timing specifications — SCL and SDA<sup>1,2,3,4</sup>

No.	Symbol	Parameter	Value		Unit
			Min	Max	
1	—	CC Start condition hold time	6	—	PER_CLK Cycle <sup>5</sup>
2	—	CC Clock low time	10	—	PER_CLK Cycle
3	—	CC Bus free time between Start and Stop condition	4.7	—	μs
4	—	CC Data hold time	7	—	PER_CLK Cycle
5	—	CC Clock high time	10	—	PER_CLK Cycle
6	—	CC Data setup time	2	—	PER_CLK Cycle
7	—	CC Start condition setup time (for repeated start condition only)	20	—	PER_CLK Cycle
8	—	CC Stop condition setup time	10	—	PER_CLK Cycle

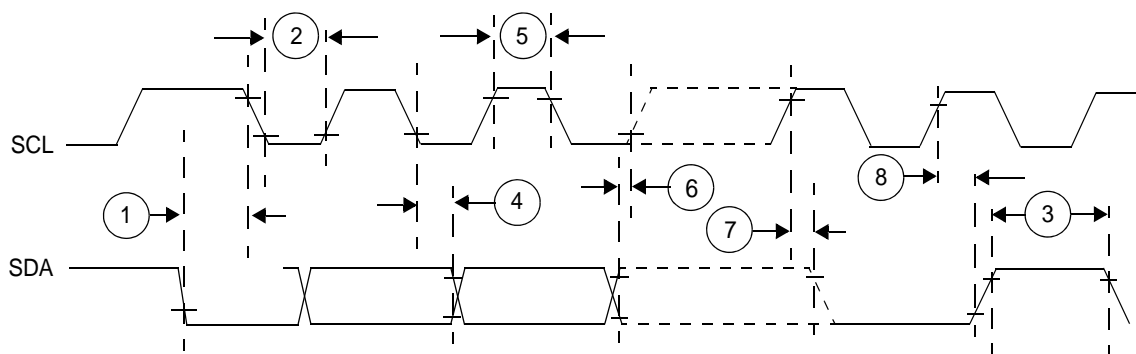

<sup>1</sup> All output timing is worst case and includes the mismatching of rise and fall times of the output pads.

<sup>2</sup> Output parameters are valid for C<sub>L</sub> = 25 pF, where C<sub>L</sub> is the external load to the device (lumped). The internal package capacitance is accounted for, and does not need to be subtracted from the 25 pF value.

<sup>3</sup> Timing is guaranteed to same drive capabilities for all signals, mixing of pad drives may reduce operating speeds and may cause incorrect operation.

<sup>4</sup> Programming the IBFD register (I<sup>2</sup>C bus Frequency Divider) with the maximum frequency results in the minimum output timings listed. The I<sup>2</sup>C interface is designed to scale the data transition time, moving it to the middle of the SCL low period. The actual position is affected by the pre-scale and division values programmed in the IBC field of the IBFD register.

<sup>5</sup> PER\_CLK is the SoC peripheral clock, which drives the I<sup>2</sup>C BIU and module clock inputs. See the Clocking chapter in the device reference manual for more detail.

Figure 53. I<sup>2</sup>C input/output timing

### 3.16.9 GPIO delay timing

The GPIO delay timing specification is provided in the following table.

Table 72. GPIO delay timing

Symbol		Parameter	Value		Unit
			Min	Max	
IO_delay	CC	Delay from SIUL2 MSCR register bit update to pad function enable at the input of the I/O pad	5	25	ns

### 3.16.10 Package characteristics

The following table lists the case numbers for each available package for the device.

Table 73. Package case numbers

Package Type	Device Type	Case Outline Number

## 3.20 Thermal characteristics

The following tables describe the thermal characteristics of the device.

**Table 74. Thermal characteristics**

Symbol	Parameter	Conditions	416 Value	512 Value	Unit	Notes
$R_{\theta JA}$	Junction-to-Ambient, Natural Convection	Single Layer board (1s)	25	24.1	°C/W	1,2
		Four layer board (2s2p)	17.2	16.8		1,2,3
$R_{\theta JMA}$	Junction-to-Moving-Air, Ambient	@200 ft/min., single layer board (1s)	18.1	16.6	°C/W	1,3
		@200 ft/min., four layer board (2s2p)	13.4	12.4		1,3
$R_{\theta JB}$	Junction-to-board	—	8.6	8.8	°C/W	4
$R_{\theta JC}$	Junction-to-case	—	5.0	5.0	°C/W	5
$\Psi_{JT}$	Junction-to-package top	Natural convection	0.2	0.2	°C/W	6
$\Psi_{JB}$	Junction-to-package bottom/solder balls	Natural convection	3.5	3.0	°C/W	7

<sup>1</sup> Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.

<sup>2</sup> Per SEMI G38-87 and JEDEC JESD51-2 with the single layer board horizontal.

<sup>3</sup> Per JEDEC JESD51-6 with the board horizontal.

<sup>4</sup> Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

<sup>5</sup> Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).

<sup>6</sup> Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2.

<sup>7</sup> Thermal characterization parameter indicating the temperature difference between package bottom center and the junction temperature per JEDEC JESD51-12.

### 3.20.1 General notes for specifications at maximum junction temperature

An estimation of the chip junction temperature,  $T_J$ , can be obtained from the equation:

$$T_J = T_A + (R_{\theta JA} * P_D) \quad \text{Eqn. 1}$$

where:

$T_A$  = ambient temperature for the package (°C)

$R_{\theta JA}$  = junction-to-ambient thermal resistance (°C/W)

$P_D$  = power dissipation in the package (W)

The thermal resistance values used are based on the JEDEC JESD51 series of standards to provide consistent values for estimations and comparisons. The difference between the values determined for the single-layer (1s) board compared to a four-layer board that has two signal layers, a power and a ground plane (2s2p), demonstrate that the effective thermal resistance is not a constant. The thermal resistance depends on the:

## Electrical characteristics

- Construction of the application board (number of planes)
- Effective size of the board which cools the component
- Quality of the thermal and electrical connections to the planes
- Power dissipated by adjacent components

Connect all the ground and power balls to the respective planes with one via per ball. Using fewer vias to connect the package to the planes reduces the thermal performance. Thinner planes also reduce the thermal performance. When the clearance between the vias leave the planes virtually disconnected, the thermal performance is also greatly reduced.

As a general rule, the value obtained on a single-layer board is within the normal range for the tightly packed printed circuit board. The value obtained on a board with the internal planes is usually within the normal range if the application board has:

- One oz. (35 micron nominal thickness) internal planes
- Components are well separated
- Overall power dissipation on the board is less than  $0.02 \text{ W/cm}^2$

The thermal performance of any component depends on the power dissipation of the surrounding components. In addition, the ambient temperature varies widely within the application. For many natural convection and especially closed box applications, the board temperature at the perimeter (edge) of the package is approximately the same as the local air temperature near the device. Specifying the local ambient conditions explicitly as the board temperature provides a more precise description of the local ambient conditions that determine the temperature of the device.

At a known board temperature, the junction temperature is estimated using the following equation:

$$T_J = T_B + (R_{\theta JB} * P_D) \quad \text{Eqn. 2}$$

where:

$T_B$  = board temperature for the package perimeter ( $^{\circ}\text{C}$ )

$R_{\theta JB}$  = junction-to-board thermal resistance ( $^{\circ}\text{C/W}$ ) per JESD51-8

$P_D$  = power dissipation in the package (W)

When the heat loss from the package case to the air does not factor into the calculation, the junction temperature is predictable if the application board is similar to the thermal test condition, with the component soldered to a board with internal planes.

The thermal resistance is expressed as the sum of a junction-to-case thermal resistance plus a case-to-ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA} \quad \text{Eqn. 3}$$

where:

$R_{\theta JA}$  = junction-to-ambient thermal resistance ( $^{\circ}\text{C/W}$ )

$R_{\theta JC}$  = junction-to-case thermal resistance ( $^{\circ}\text{C/W}$ )

$R_{\theta CA}$  = case to ambient thermal resistance ( $^{\circ}\text{C/W}$ )

$R_{\theta JC}$  is device related and is not affected by other factors. The thermal environment can be controlled to change the case-to-ambient thermal resistance,  $R_{\theta CA}$ . For example, change the air flow around the device, add a heat sink, change the mounting arrangement on the printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device. This description is most useful for packages with heat sinks where 90% of the heat flow is through the case to heat sink to ambient. For most packages, a better model is required.

A more accurate two-resistor thermal model can be constructed from the junction-to-board thermal resistance and the junction-to-case thermal resistance. The junction-to-case thermal resistance describes when using a heat sink or where a substantial amount of heat is dissipated from the top of the package. The junction-to-board thermal resistance describes the thermal performance when most of the heat is conducted to the printed circuit board. This model can be used to generate simple estimations and for computational fluid dynamics (CFD) thermal models. More accurate compact Flotherm models can be generated upon request.

To determine the junction temperature of the device in the application on a prototype board, use the thermal characterization parameter ( $\Psi_{JT}$ ) to determine the junction temperature by measuring the temperature at the top center of the package case using the following equation:

$$T_J = T_T + (\Psi_{JT} \times P_D) \quad \text{Eqn. 4}$$

where:

$T_T$  = thermocouple temperature on top of the package ( $^{\circ}\text{C}$ )

$\Psi_{JT}$  = thermal characterization parameter ( $^{\circ}\text{C}/\text{W}$ )

$P_D$  = power dissipation in the package (W)

The thermal characterization parameter is measured in compliance with the JESD51-2 specification using a 40-gauge type T thermocouple epoxied to the top center of the package case. Position the thermocouple so that the thermocouple junction rests on the package. Place a small amount of epoxy on the thermocouple junction and approximately 1 mm of wire extending from the junction. Place the thermocouple wire flat against the package case to avoid measurement errors caused by the cooling effects of the thermocouple wire.

When board temperature is perfectly defined below the device, it is possible to use the thermal characterization parameter ( $\Psi_{JPB}$ ) to determine the junction temperature by measuring the temperature at the bottom center of the package case (exposed pad) using the following equation:

$$T_J = T_B + (\Psi_{JPB} \times P_D) \quad \text{Eqn. 5}$$

where:

$T_T$  = thermocouple temperature on bottom of the package ( $^{\circ}\text{C}$ )

$\Psi_{JT}$  = thermal characterization parameter ( $^{\circ}\text{C}/\text{W}$ )

$P_D$  = power dissipation in the package (W)

## 4 Ordering information

Table 75 shows the orderable part numbers for the MPC5777M series.

**Table 75. Orderable part number summary**

Part Number	Device Type <sup>1,2</sup>	Package
PPC5777MK0MVU8B	Sample	416 TEPBGA
PPC5777MK0MVA8B	Sample	512 TEPBGA
PPC5777M2K0MVU8B	Sample ED	416 TEPBGA
PPC5777M2K0MVA8B	Sample ED	512 TEPBGA
SPC5777MK0MVU8	Production PD	416 TEPBGA
SPC5777MK0MVU8R	Production PD	416 TEPBGA w/Tape and Reel
SPC5777MK0MVA8	Production PD	512 TEPBGA
SPC5777MK0MVA8R	Production PD	512 TEPBGA w/Tape and Reel

<sup>1</sup> "PD" refers to a production device, orderable in quantity

## Ordering information

- <sup>2</sup> "ED" refers to an emulation device, orderable in limited quantities. An emulation device (ED) is for use during system development only and is not to be used in production. An ED is a Production PD chip combined with a companion chip to form an Emulation and Debug Device (ED) and includes additional RAM memory and debug features. EDs are provided "as is" without warranty of any kind. In the event of a suspected ED failure, NXP agrees to exchange the suspected failing ED from the customer at no additional charge; however, NXP will not analyze ED returns.

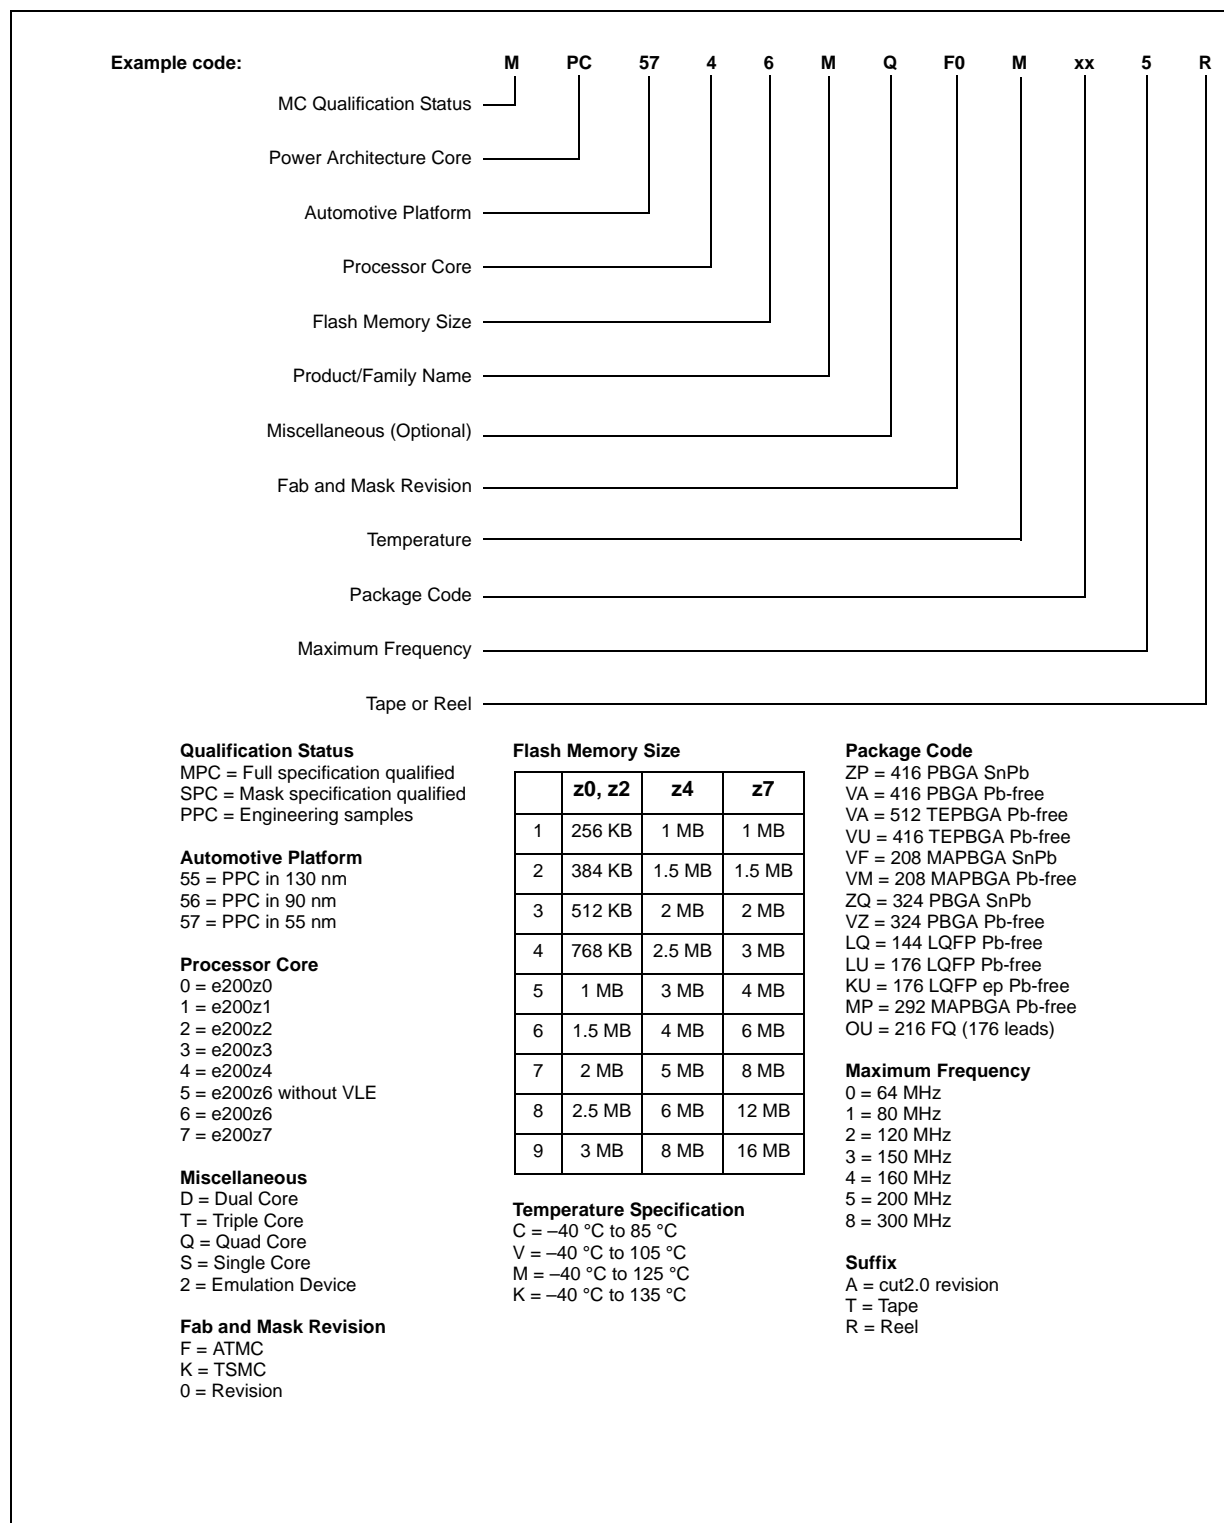

Figure 61. Product code structure

## 5 Document revision history

Table 76 summarizes revisions to this document.

**Table 76. Revision history**

Revision	Date	Description of changes
1	12/2011	Initial release
2	4/2013	<b>Throughout</b>
		<ul style="list-style-type: none"> <li>Data sheet now includes both KGD (<math>T_J \leq 165^\circ\text{C}</math>) and non-KGD (<math>T_J \leq 150^\circ\text{C}</math>) specifications</li> <li>The interfaces and components formerly including the name “DigRF” have been renamed to “LFAST.”</li> </ul>
		<b>Introduction</b>
		<ul style="list-style-type: none"> <li>Changed on-chip general-purpose SRAM to 404 KB (was 384 KB)</li> <li>Changed item describing Boot Assist Flash support to “Boot Assist Module (BAM) supports factory programming using serial bootload through ‘UART Serial Boot Mode Protocol’. Physical interface (PHY) can be: UART/LIN, CAN, FlexRay”</li> </ul>
		<p><a href="#">Table 1 (Family comparison):</a></p> <ul style="list-style-type: none"> <li>Changed feature from “Zipwire/LFAST<sup>7</sup> bus” to “Zipwire (SIPI / LFAST<sup>7</sup>) Interprocessor Communication Interface”</li> </ul>

5	6/2015	<b>Electrical characteristics—I/O pad current specification</b>
		<p>Replaced <a href="#">Figure 18 (I/O output DC electrical characteristics definition)</a>.  <a href="#">Table 12 (I/O input DC electrical characteristics)</a></p> <ul style="list-style-type: none"> <li>• <math>V_{IH\text{AUT}}</math> specification: changed min value to 3.8 V.</li> <li>• <math>V_{HYSTTL}</math>: Changed min value to 0.250 V (was 0.275). Removed footnote (“Minimum hysteresis...” ) from min value.</li> </ul> <p><a href="#">Table 13 (I/O pull-up/pull-down DC electrical characteristics)</a></p> <ul style="list-style-type: none"> <li>• Added “AUTO” and “CMOS” designations to conditions for <math> I_{WPU} </math> and <math> I_{WPD} </math>.</li> <li>• <math> I_{WPU} </math> specification: changed final condition row to “<math>V_{IN} = 0.35 \cdot V_{DD\_HV\_IO}</math>” (was “<math>V_{IN} = 0.65 \cdot V_{DD\_HV\_IO}</math>”).</li> </ul> <p><a href="#">Table 14 (WEAK configuration output buffer electrical characteristics)</a></p> <ul style="list-style-type: none"> <li>• <math>R_{OH\_W}</math> specification: changed min value to 520 <math>\Omega</math> (was 517).</li> <li>• <math>R_{OL\_W}</math> specification: changed min value to 520 <math>\Omega</math> (was 517).</li> </ul> <p><a href="#">Table 15 (MEDIUM configuration output buffer electrical characteristics)</a>, <a href="#">Table 16 (STRONG configuration output buffer electrical characteristics)</a>, and <a href="#">Table 17 (VERY STRONG configuration output buffer electrical characteristics)</a></p> <ul style="list-style-type: none"> <li>• Changed specification to <math>t_{PD50-50}</math> and revised row.</li> </ul> <p><a href="#">Table 16 (STRONG configuration output buffer electrical characteristics)</a></p> <ul style="list-style-type: none"> <li>• Added <math> t_{SKEW\_S} </math> specification.</li> </ul> <p><a href="#">Table 17 (VERY STRONG configuration output buffer electrical characteristics)</a></p> <ul style="list-style-type: none"> <li>• Added <math>I_{DCMAX\_VS}</math> specification.</li> </ul> <p><a href="#">Table 18 (EBI pad output electrical specification)</a></p> <ul style="list-style-type: none"> <li>• Removed all specifications in Input Specifications section and changed table title to “EBI Pad Output Electrical Specifications.”</li> <li>• <math>t_{PD\_EBI}</math>: changed parameter to “50% – 50% threshold...” (was “50% - 10% 90% threshold...” ) and changed max value to 4.0 ns (was 5.5).</li> <li>• <math>R_{OH\_EBI\_GPIO}</math> specification: change min value to 100 <math>\Omega</math> (was 150).</li> </ul>
		<b>Electrical characteristics—Oscillator and FMPLL</b>
		<p><a href="#">Table 21 (PLL0 electrical characteristics)</a></p> <ul style="list-style-type: none"> <li>• Added footnote (“<math>f_{PLL0IN}</math> frequency must be...” ) to <math>f_{PLL0IN}</math> parameter.</li> <li>• Changed footnote text to “Noise on the <math>V_{DD\_LV}</math> supply...” (was “<math>V_{DD\_LV}</math> noise due...” ).</li> <li>• Added footnote (“PLL jitter is guaranteed when...” ) to <math> \Delta_{PLL0PHISPJ} </math>, <math> \Delta_{PLL0PHI1SPJ} </math>, and <math>\Delta_{PLL0LTJ}</math> specifications.</li> <li>• Added <math>f_{PLL0VCOFR}</math> specification.</li> </ul> <p><a href="#">Table 22 (PLL1 electrical characteristics)</a>,</p> <ul style="list-style-type: none"> <li>• Added <math>f_{PLL1VCOFR}</math> specification.</li> </ul> <p><a href="#">Table 24 (Selectable load capacitance)</a></p> <ul style="list-style-type: none"> <li>• Significant changes throughout table.</li> </ul>

Table 76. Revision history (continued)

Revision	Date	Description of changes
5	6/2015	<b>Electrical characteristics—ADC specifications</b>
		In <a href="#">Table 27 (SARn ADC electrical specification)</a>
		<ul style="list-style-type: none"> <li>• <math>I_{ADCREFH}</math> specification: changed min value for Run mode <math>t_{conv} \geq 5 \mu s</math> condition to <math>7 \mu A</math> (was <math>3.5</math>). Changed max value for Power Down mode condition to <math>6 \mu A</math> (was <math>1</math>).</li> <li>• <math>I_{ADV\_S}</math> specification, Power Down mode: changed max value to <math>1.0 mA</math> (was <math>0.04</math>).</li> <li>• INL and DNL rows: removed injection current footnote.</li> <li>• <math>TUE_{12}</math> row: changed footnote text to “This parameter is guaranteed...” (was “TUE, INL, and DNL are granted...”). Removed <math>T_J &lt; 150 ^\circ C</math>, <math>V_{DD\_HV\_ADV\_S} &gt; 4 V</math>, <math>V_{DD\_HV\_ADR\_S} &gt; 4 V</math> condition row.</li> </ul>
		In <a href="#">Table 28 (SDn ADC electrical specification)</a>
		<ul style="list-style-type: none"> <li>• <math>V_{OFFSET}</math>: Changed parameter name to “Input Referred Offset Error” (was “Conversion Offset”) and added footnote (“Conversion offset error must be...”).</li> <li>• <math>SNR_{DIFF150}</math>, <math>SNR_{DIFF333}</math>, <math>SNR_{SE150}</math>: removed footnote (“SNR degraded by 3dB...”) and changed conditions range to <math>4.5</math> (was <math>4.0</math>).</li> <li>• <math>SNR_{SE150}</math> specification: revised min values for each condition. Added footnote (“This parameter is guaranteed...”).</li> <li>• For first footnote “S/D ADC is functional in the range...” changed voltage range to <math>3.6 V - 4.5 V</math> (was <math>3.6 V &lt; V_{DD\_HV\_ADV\_D} &lt; 4.0 V</math>) and added “Degraded SNR value based on simulation.”</li> <li>• For second footnote “S/D ADC is functional in the range...” changed voltage range to <math>3.0 V - 4.5 V</math> and added “Degraded SNR value based on simulation.”</li> <li>• <math>V_{cmrr}</math> specification: changed min value to <math>54 dB</math> (was <math>20 dB</math>).</li> <li>• <math>\delta_{GROUP}</math> specification: increased the max value for each condition by <math>3 Tclk</math>.</li> <li>• <math>\Sigma I_{ADR\_D}</math> specification: changed max value to <math>30 \mu A</math> (was <math>20</math>). Added “<math>f_{ADCD\_M} = 14.4 MHz</math>” to condition.</li> </ul>
		<b>Electrical characteristics—LFAST electrical specifications</b>
		<a href="#">Table 30 (LVDS pad startup and receiver electrical characteristics,)</a>
		<ul style="list-style-type: none"> <li>• Revised entire <math>R_{IN}</math> specification row.</li> </ul>
		<a href="#">Table 31 (LFAST transmitter electrical characteristics,)</a>
		<ul style="list-style-type: none"> <li>• <math>f_{DATA}</math>: Changed max value to “<math>312/320</math>” (was <math>320</math>) and added footnote.</li> </ul>
		<a href="#">Table 33 (LFAST PLL electrical characteristics)</a>
		<ul style="list-style-type: none"> <li>• Changed <math>ERR_{REF}</math> and <math>DC_{REF}</math> parameter descriptions to “PLL input reference clock” (was “PLL reference clock”).</li> </ul>
		<b>Electrical characteristics—Power management: PMC, POR/LVD, sequencing</b>
		<a href="#">Table 36 (Flash power supply)</a>
		<ul style="list-style-type: none"> <li>• Removed <math>V_{DD\_HV\_PMC}</math> row (this specification documented in <a href="#">Table 8 (Device operating conditions)</a>).</li> </ul>
		<b>Electrical characteristics—Flash memory electrical characteristics</b>
		<ul style="list-style-type: none"> <li>• Added <a href="#">Section 3.15.7, Flash read wait state and address pipeline control settings</a>.</li> </ul>
		<b>Electrical characteristics—AC specifications—DSPI</b>
		<ul style="list-style-type: none"> <li>• Substantial revisions to <a href="#">Section 3.16.2, DSPI timing with CMOS and LVDS pads</a>.</li> </ul>
		<b>Electrical characteristics—AC specifications—FlexRay</b>
		<a href="#">Table 66 (RxD input characteristics)</a>
		<ul style="list-style-type: none"> <li>• Revised footnote (“FlexRay RxD timing is valid . . .”).</li> </ul>

Table 76. Revision history (continued)

Revision	Date	Description of changes
5	6/2015	<b>Ordering Information</b>
		<a href="#">Table 75 (Orderable part number summary)</a> • Revised ED footnote (“‘ED’ refers to . . .”).
6	6/2016	<b>Introduction</b>
		<a href="#">Section 1.3, Device feature</a> • Changed the name of the section to Device feature. • <a href="#">Table 1 (MPC5777M feature)</a> Changed the name of the table to MPC5777M feature. <a href="#">Figure 1</a> • Removed the 50 MHz from the concentrator box and added 50 MHz and 100 Mhz to the connection arrows.
		<b>Electrical characteristics—I/O pad specification</b>
		<a href="#">Section 3.7, I/O pad current specification</a> • Added paragraph (In order to ensure device reliability....., and In order to ensure device functionality....). • Removed the entries $I_{RMS\_SEG}$ and $I_{DYN\_SEG}$ in <a href="#">Table 19 (I/O consumption)</a> . <a href="#">Table 12 (I/O input DC electrical characteristics)</a> • $V_{HYSTTL}$ specification: Changed min value to 0.275 V (was 0.250 V)
		<b>Electrical characteristics—Oscillator and FMPLL</b>
		<a href="#">Table 25 (Internal RC Oscillator electrical specifications)</a> • Added $\delta f_{TRIM}$ specification.
		<b>Electrical characteristics—ADC Specifications</b>
		<a href="#">Table 28 (SDn ADC electrical specification)</a> , • $Z_{DIFF}$ , $Z_{CM}$ and $\Delta V_{INTCM}$ specifications added. $R_{BIAS}$ specification has been updated.
		<b>Electrical characteristics—AC specifications—FlexRay</b>
		<a href="#">Table 66 (RxD input characteristics)</a> • Changed footnote (“FlexRay RxD timing is valid . . .”).
