1 Summary description

signals connected to this device.

The M27W401 is a low voltage 4 Mbit EPROM offered in the two ranges UV (ultra violet erase) and OTP (one time programmable). It is ideally suited for microprocessor systems requiring large data or program storage and is organised as 524,288 by 8 bits.

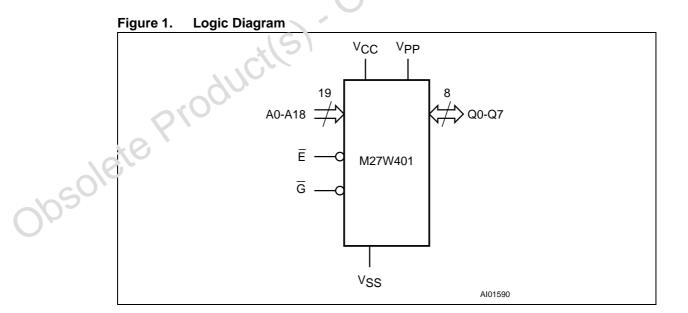

The M27W401 operates in the read mode with a supply voltage as low as 2.7V at –40 to 85°C temperature range. The decrease in operating power allows either a reduction of the size of the battery or an increase in the time between battery recharges.

The FDIP32W (window ceramic frit-seal package) has a transparent lid which allows the user to expose the chip to ultraviolet light to erase the bit pattern. A new pattern can then be written to the device by following the programming procedure.

For application where the content is programmed only one time and erasure is not required, the M27W401 is offered in PDIP32, PLCC32 and TSOP32 (8 x 20 mm) packages.

In order to meet environmental requirements, ST offers the M27W401 in ECOPACK® packages. ECOPACK packages are Lead-free. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label.

ECOPACK is an ST trademark. ECOPACK® specifications are available at: www.st.com. See *Figure 1: Logic Diagram* and *Table 1: Signe I descriptions* for a brief overview of the

Device description 2

Table 2 lists the operating modes of the M27W40. A single power supply is required in the read mode. All inputs are TTL levels except for V_{PP} and 12V on A9 for Electronic Signature.

| Mode | Ē | G | A9 | V _{PP} | Q7-Q0 |
|--|-----------------------|-----------------|-----------------|-------------------------------------|----------|
| Read | V _{IL} | V _{IL} | Х | $\rm V_{CC}$ or $\rm V_{SS}$ | Data Out |

| Electronic Signature | V _{IL} | V _{IL} | V _{ID} | , v _{cc} | Codes |
| $X = V_{IH} \text{ or } V_{IL}, V_{ID} = 12V \pm 0.5V.$ Read mode | | | | | |

Table 2. **Operating modes**

 $X = V_{IH} \text{ or } V_{IL}, V_{ID} = 12V \pm 0.5V.$ Note:

2.1 Read mode

The M27W401 has two control functions, both of which must be logically active in order to obtain data at the outputs. Chip Enable (E) is the power control and should be used for device selection. Output Enable (\overline{G}) is the output control and should be used to gate data to the output pins, independent of cevice selection. Assuming that the addresses are stable, the address access time (t_{AVQV}) is equal to the delay from E to output (t_{ELQV}) . Data is available at the cutout after a delay of t_{GLQV} from the falling edge of G, assuming that E has been low and the rodresses have been stable for at least tAVQV-tGLOV-

2.2 Standby mode

The M27W401 has a standby mode which reduces the supply current from 15mA to 15µA with low voltage operation $V_{CC} \le 3.6V$, see Read Mode DC Characteristics table for details. The M27W401 is placed in the standby mode by applying a CMOS high signal to the \overline{E} input. When in the standby mode, the outputs are in a high impedance state, independent of the \overline{G} input.

2.3 Two-line output control

Because EPROMs are usually used in larger memory arrays, this product features a 2 line control function which accommodates the use of multiple memory connection. The two line control function allows:

- the lowest possible memory power dissipation,
- complete assurance that output bus contention will not occur.

For the most efficient use of these two control lines, E should be decoded and used as the primary device selecting function, while G should be made a common connection to all

devices in the array and connected to the READ line from the system control bus. This ensures that all deselected memory devices are in their low power standby mode and that the output pins are only active when data is required from a particular memory device.

2.4 System considerations

The power switching characteristics of Advanced CMOS EPROMs require careful decoupling of the devices. The supply current, I_{CC} , has three segments that are of interest to the system designer: the standby current level, the active current level, and transient current peaks that are produced by the falling and rising edges of \overline{E} . The magnitude of the transient current peaks is dependent on the capacitive and inductive loading of the device at the output.

The associated transient voltage peaks can be suppressed by complying with the two line output control and by properly selected decoupling capacitors. It is recommended that a 0.1µF ceramic capacitor be used on every device between V_{CC} and V_{SS} . This should be a high frequency capacitor of low inherent inductance and should be placed as close to the device as possible. In addition, a 4.7µF bulk electrolytic capacitor should be used between V_{CC} and V_{SS} for every eight devices. The bulk capacitor should be located near the power supply connection point. The purpose of the bulk capacitor is to overcome the voltage drop caused by the inductive effects of PCB traces.

2.5 Programming

The M27W401 has been designed to be fully compatible with the M27C4001 and has the same electronic signature. As a result the M27W401 can be programmed as the M27C4001 on the same programming equipment applying 12.75V on V_{PP} and 6.25V on V_{CC} by the use of the same PRESTO II algorithm.

When delivered (and after each '1's erasure for UV EPROM), all bits of the M27W401 are in the '1' state. Data it introduced by selectively programming '0's into the desired bit locations. Although chi, '0's will be programmed, both '1's and '0's can be present in the data word. The ori', way to change a '0' to a '1' is by die exposure to ultraviolet light (UV EPROM). The M27W401 is in the programming mode when V_{PP} input is at 12.75V, \overline{G} is at V_{IH} and \overline{E} is pulsed to V_{IL} . The data to be programmed is applied to 8 bits in parallel to the data output pins. The levels required for the address and data inputs are TTL. V_{CC} is specified to be 6.25V \pm 0.25V

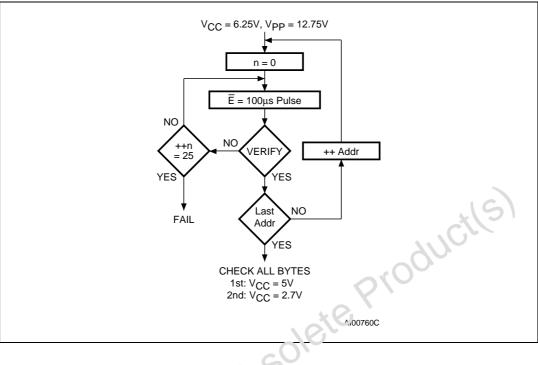

2.6

Presto II programming algorithm

Presto II Programming Algorithm allows the whole array to be programmed with a guaranteed margin, in a typical time of 52.5 seconds. Programming with Presto II consists of applying a sequence of 100µs program pulses to each byte until a correct verify occurs (see *Figure 5*). During programming and verify operation, a Margin mode circuit is automatically activated in order to guarantee that each cell is programmed with enough margin. No overprogram pulse is applied since the verify in Margin mode at VCC much higher than 3.6V, provides the necessary margin to each programmed cell.

2.7 **Program Inhibit**

Programming of multiple M27W401s in parallel with different data is also easily accomplished. Except for \overline{E}_{12} all the inputs including \overline{G} of the parallel M27W401 may be common. A TTL low level pulse applied to a M27W401's \overline{E} input, with V_{PP} at 12.75V, will program that M27W401. A high level \overline{E} input inhibits the other M27W401s from being programmed.

2.8 **Program Verify**

A verify (read) should be performed on the programmed bits to determine that they were correctly programmed. The verify is accomplished with \overline{G} at V_{IL}, \overline{E} at V_{IH}, V_{PP} at 12.75V and V_{CC} at 6.25V.

2.9 Electronic Signature

The Electronic Signature (ES) mode allows the reading out of a binary code from an EPROM that will identify its manufacturer and type. This mode is intended for use by programming equipment to automatically match the device to be programmed with its corresponding programming algorithm. The ES mode is functional in the 25°C \pm 5°C ambient temperature range that is required when programming the M27W401. To activate the ES mode, the programming equipment must force 11.5V to 12.5V on address line A9 of the M27W401 with V_{PP} = V_{CC} = 5V. Two identifier bytes may then be sequenced from the device outputs by toggling address line A0 from V_{IL} to V_{IH}. All other address lines must be held at V_{IL} during Electronic Signature mode. Byte 0 (A0 = V_{IL}) represents the manufacturer code and byte 1 (A0 = V_{IH}) the device identifier code. For the STMicroelectronics

M27W401, these two identifier bytes are given in *Table 3* and can be read-out on outputs Q7 to Q0. Note that the M27W401 and M27C4001 have the same identifier bytes.

| Table 3. | Electronic | Signature |
|----------|------------|-----------|
|----------|------------|-----------|

| Identifier | A0 | Q7 | Q6 | Q5 | Q4 | Q3 | Q2 | Q1 | Q0 | Hex Data |
|---------------------|-----------------|----|----|----|----|----|----|----|----|----------|
| Manufacturer's Code | V_{IL} | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 20h |
| Device Code | V_{IH} | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 41h |

2.10 Erasure operation (applies to UV EPROM)

The erasure characteristics of the M27W401 are such that erasure begins when the calls are exposed to light with wavelengths shorter than approximately 4000 Å. It should be noted that sunlight and some type of fluorescent lamps have wavelengths in the 3000-4000 Å range. Data shows that constant exposure to room level fluorescent lighting could erase a typical M27W401 in about 3 years, while it would take approximately 1 week to cause erasure when exposed to direct sunlight. If the M27W401 is to be are sed to these types of lighting conditions for extended periods of time, it is suggested that opaque labels be put over the M27W401 window to prevent unintentional erasure. The recommended erasure procedure for the M27W401 is exposure to short wave united tight which has wavelength of 2537 Å. The integrated dose (i.e. UV intensity x are clust is approximately 15 to 20 minutes using an ultraviolet lamp with 12000 µ^W//cm² power rating. The M27W401 should be placed within 2.5 cm (1 inch) of the lamp ubes during the erasure. Some lamps have a filter on their tubes which should be removed before erasure.

3 Maximum ratings

| Symbol | Parameter | Value | Unit |
|--------------------------------|--|------------|------|
| T _A | Ambient Operating Temperature ⁽²⁾ | -40 to 85 | °C |
| T _{BIAS} | Temperature Under Bias | -50 to 125 | °C |
| T _{STG} | Storage Temperature | -65 to 150 | °C |
| V _{IO} ⁽³⁾ | Input or Output Voltage (except A9) | -2 to 7 | V |
| V _{CC} | Supply Voltage | -2 to 7 | V |
| V _{A9} ⁽³⁾ | A9 Voltage | -2 to 13.5 | 51 |
| V _{PP} | Program Supply Voltage | -2 to 14 | V |

| Table 4. | Absolute | Maximum | Ratings (| 1) |
|----------|----------|---------|-----------|----|
|----------|----------|---------|-----------|----|

1. Except for the rating "Operating Temperature Range", stresses above those listed in the Table "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indirated in the Operating sections of this specification is not implied. Exposure to Absolute Maximum Rating on litic ns for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

2. Depends on range.

3. Minimum DC voltage on Input or Output is -0.5V with prissible overshoot to -2.0V for a period less than 20ns. Maximum DC voltage on Output is VCC +0.5V with prissible overshoot to VCC +2V for a period less than 20ns.

4 DC and AC parameters

 $T_A = -40$ to 85°C; $V_{CC} = 2.7V$ to 3.6V; $V_{PP} = V_{CC}$

6 Part numbering

Table 15. Ordering Information Scheme

| Example: | M27W401 | -80 K 6 |
|---|----------|---------|
| Device Type | | |
| M27 | | |
| Supply Voltage | | |
| W = 2.7V to 3.6V | | |
| Device Function | | |
| 401 = 4 Mbit (512Kb x 8) | | x (S) |
| Speed | | |
| -80 ⁽¹⁾ ⁽²⁾ = 80 ns | | |
| -100 = 100 ns | | |
| Not For New Design ⁽³⁾ | | K i |
| -120 = 120 ns | XU | |
| -150 = 150 ns | 16. | |
| -200 = 200 ns | <u> </u> | |
| Deckers | 03 | |
| Package F = FDIP32W ⁽⁴⁾ | | |
| B = PDIP32 | | |
| K = PLCC32 | | |
| N = TSOP32: 8 x 20 mm (4) | | |
| N = 1001 32. 0 X 20 mm | | |
| Temperature Range | | |
| 6 = −40 to 85 °C | | |
| | | |

- 1. Figh Speed, see AC Characteristics section for further information.
- 2. This speed also guarantees 70ns access time at V_{CC} = 3.0V to 3.6V.
- 3. These speeds are replaced by the 100 ns.
- 4. Packages option available on request. Please contact STMicroelectronics local Sales Office.

For a list of available options (Speed, Package, etc...) or for further information on any aspect of this device, please contact the STMicroelectronics Sales Office nearest to you.
