V _{DD}	24	21	supply voltage

[1] HVQFN package die supply ground is connected to both V_{SS} pin and exposed center pad. V_{SS} pin must be connected to supply ground for proper device operation. For enhanced thermal, electrical, and board level performance, the exposed pad needs to be soldered to the board using a corresponding thermal pad on the board and for proper heat conduction through the board, thermal vias need to be incorporated in the printed-circuit board in the thermal pad region.

6. Functional description

Refer to [Figure 1 “Block diagram of PCA9552”](#).

6.1 Device address

Following a START condition, the bus master must output the address of the slave it is accessing. The address of the PCA9552 is shown in [Figure 5](#). To conserve power, no internal pull-up resistors are incorporated on the hardware selectable address pins and they must be pulled HIGH or LOW.

Fig 5. PCA9552 address

The last bit of the address byte defines the operation to be performed. When set to logic 1 a read is selected, while a logic 0 selects a write operation.

6.2 Control Register

Following the successful acknowledgement of the slave address, the bus master will send a byte to the PCA9552, which will be stored in the Control Register. This register can be read and written via the I²C-bus.

Fig 6. Control Register

The lowest 3 bits are used as a pointer to determine which register will be accessed.

If the Auto-Increment flag (AI) is set, the four low order bits of the Control Register are automatically incremented after a read or write. This allows the user to program the registers sequentially. The contents of these bits will rollover to '0000' after the last register is accessed.

When the Auto-Increment flag is set (AI = 1) and a read sequence is initiated, the sequence must start by reading a register different from '0' (B3 B2 B1 B0 ≠ 0000).

Only the 4 least significant bits are affected by the AI flag. Unused bits must be programmed with zeroes.

6.2.1 Control Register definition

Table 3: Register summary

B3	B2	B1	B0	Symbol	Access	Description
0	0	0	0	INPUT0	read only	input register 0

1	0	0	1	LS3	read/write	LED12 to LED15 selector

6.3 Register descriptions

6.3.1 INPUT0 - Input register 0

The Input register 0 reflects the state of the device pins (inputs LED0 to LED7). Writes to this register will be acknowledged but will have no effect.

Table 4: INPUT0 - input register 0 description

Bit	7	6	5	4	3	2	1	0
Symbol	LED7	LED6	LED5	LED4	LED3	LED2	LED1	LED0
Default	X	X	X	X	X	X	X	X

Remark: The default value 'X' is determined by the externally applied logic level (normally logic 1) when used for directly driving LED with pull-up to V_{DD}.

6.3.2 INPUT1 - Input register 1

The Input register 1 reflects the state of the device pins (inputs LED8 to LED15). Writes to this register will be acknowledged but will have no effect.

Table 5: INPUT1 - input register 1 description

Bit	7	6	5	4	3	2	1	0
Symbol	LED15	LED14	LED13	LED12	LED11	LED10	LED9	LED8
Default	X	X	X	X	X	X	X	X

Remark: The default value 'X' is determined by the externally applied logic level (normally logic 1) when used for directly driving LED with pull-up to V_{DD}.

6.3.3 PCS0 - Frequency Prescaler 0

PCS0 is used to program the period of the PWM output.

The period of BLINK0 = (PSC0 + 1) / 44.

Table 6: PCS0 - Frequency Prescaler 0 register description

Bit	7	6	5	4	3	2	1	0
Symbol	PSC0[7]	PSC0[6]	PSC0[5]	PSC0[4]	PSC0[3]	PSC0[2]	PSC0[1]	PSC0[0]
Default	1	1	1	1	1	1	1	1

6.3.4 PWM0 - Pulse Width Modulation 0

The PWM0 register determines the duty cycle of BLINK0. The outputs are LOW (LED off) when the count is less than the value in PWM0 and HIGH when it is greater. If PWM0 is programmed with 00h, then the PWM0 output is always LOW.

The duty cycle of BLINK0 = (256 – PWM0) / 256.

Table 7: PWM0 - Pulse Width Modulation 0 register description

Bit	7	6	5	4	3	2	1	0
Symbol	PWM0 [7]	PWM0 [6]	PWM0 [5]	PWM0 [4]	PWM0 [3]	PWM0 [2]	PWM0 [1]	PWM0 [0]
Default	1	0	0	0	0	0	0	0

6.3.5 PCS1 - Frequency Prescaler 1

PSC1 is used to program the period of the PWM output.

The period of BLINK1 = (PSC1 + 1) / 44.

Table 8: PCS1 - Frequency Prescaler 1 register description

Bit	7	6	5	4	3	2	1	0
Symbol	PSC1[7]	PSC1[6]	PSC1[5]	PSC1[4]	PSC1[3]	PSC1[2]	PSC1[1]	PSC1[0]
Default	1	1	1	1	1	1	1	1

6.3.6 PWM1 - Pulse Width Modulation 1

The PWM1 register determines the duty cycle of BLINK1. The outputs are LOW (LED off) when the count is less than the value in PWM1 and HIGH when it is greater. If PWM1 is programmed with 00h, then the PWM1 output is always LOW.

The duty cycle of BLINK1 = (256 – PWM1) / 256.

Table 9: PWM1 - Pulse Width Modulation 1 register description

Bit	7	6	5	4	3	2	1	0
Symbol	PWM1 [7]	PWM1 [6]	PWM1 [5]	PWM1 [4]	PWM1 [3]	PWM1 [2]	PWM1 [1]	PWM1 [0]
Default	1	0	0	0	0	0	0	0

6.3.7 LS0 to LS3 - LED selector registers

The LSn LED select registers determine the source of the LED data.

00 = output is set LOW (LED on)

01 = output is set high-impedance (LED off; default)

10 = output blinks at PWM0 rate

11 = output blinks at PWM1 rate

Table 10: LS0 to LS3 - LED selector registers bit description

Legend: * default value

Register	Bit	Value	Description
LS0 - LED0 to LED3 selector			
LS0	7:6	01*	LED3 selected
	5:4	01*	LED2 selected
	3:2	01*	LED1 selected
	1:0	01*	LED0 selected
LS1 - LED4 to LED7 selector			
LS1	7:6	01*	LED7 selected
	5:4	01*	LED6 selected
	3:2	01*	LED5 selected
	1:0	01*	LED4 selected
LS2 - LED8 to LED11 selector			
LS2	7:6	01*	LED11 selected
	5:4	01*	LED10 selected
	3:2	01*	LED9 selected
	1:0	01*	LED8 selected
LS3 - LED12 to LED15 selector			
LS3	7:6	01*	LED15 selected
	5:4	01*	LED14 selected
	3:2	01*	LED13 selected
	1:0	01*	LED12 selected

6.4 Pins used as GPIOs

LED pins not used to control LEDs can be used as general purpose I/Os (GPIOs).

For use as input, set LEDn to high-impedance (01) and then read the pin state via the input register.

For use as output, connect external pull-up resistor to the pin and size it according to the DC recommended operating characteristics. LED output pin is HIGH when the output is programmed as high-impedance, and LOW when the output is programmed LOW through the 'LED selector' register. The output can be pulse-width controlled when PWM0 or PWM1 are used.

6.5 Power-on reset

When power is applied to V_{DD} , an internal Power-On Reset (POR) holds the PCA9552 in a reset condition until V_{DD} has reached V_{POR} . At that point, the reset condition is released and the PCA9552 registers are initialized to their default states. Thereafter, V_{DD} must be lowered below 0.2 V to reset the device.

6.6 External $\overline{\text{RESET}}$

A reset can be accomplished by holding the $\overline{\text{RESET}}$ pin LOW for a minimum of $t_{w(\text{rst})}$. The PCA9552 registers and I²C-bus state machine will be held in their default states until the $\overline{\text{RESET}}$ input is once again HIGH.

This input requires a pull-up resistor to V_{DD} if no active connection is used.

7. Characteristics of the I²C-bus

The I²C-bus is for 2-way, 2-line communication between different ICs or modules. The two lines are a serial data line (SDA) and a serial clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

7.1 Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse as changes in the data line at this time will be interpreted as control signals (see [Figure 7](#)).

7.1.1 START and STOP conditions

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line while the clock is HIGH is defined as the START condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition (P) (see [Figure 8](#).)

7.2 System configuration

A device generating a message is a 'transmitter'; a device receiving is the 'receiver'. The device that controls the message is the 'master' and the devices which are controlled by the master are the 'slaves' (see [Figure 9](#)).

Fig 9. System configuration

7.3 Acknowledge

The number of data bytes transferred between the START and the STOP conditions from transmitter to receiver is not limited. Each byte of eight bits is followed by one acknowledge bit. The acknowledge bit is a HIGH level put on the bus by the transmitter, whereas the master generates an extra acknowledge related clock pulse.

A slave receiver which is addressed must generate an acknowledge after the reception of each byte. Also a master must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges has to pull down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse; set-up and hold times must be taken into account.

A master receiver must signal an end of data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event, the transmitter must leave the data line HIGH to enable the master to generate a STOP condition.

8. Application design-in information

8.1 Minimizing I_{DD} when the I/O is used to control LEDs

When the I/Os are used to control LEDs, they are normally connected to V_{DD} through a resistor as shown in [Figure 15](#). Since the LED acts as a diode, when the LED is off the I/O V_I is about 1.2 V less than V_{DD} . The supply current, I_{DD} , increases as V_I becomes lower than V_{DD} and is specified as ΔI_{stb} in [Table 13 "Static characteristics"](#).

Designs needing to minimize current consumption, such as battery power applications, should consider maintaining the I/O pins greater than or equal to V_{DD} when the LED is off. [Figure 15](#) shows a high value resistor in parallel with the LED. [Figure 16](#) shows V_{DD} less than the LED supply voltage by at least 1.2 V. Both of these methods maintain the input/output V_I at or above V_{DD} and prevents additional supply current consumption when the LED is off.

8.2 Programming example

The following example will show how to set LED0 to LED3 on. It will then set LED4 and LED5 to blink at 1 Hz at a 50 % duty cycle. LED6 and LED7 will be set to blink at 4 Hz and at a 25 % duty cycle. LED8 to LED15 will be set to off.

Table 11: Programming PCA9552

Program sequence	I ² C-bus
START	S
PCA9552 address with A0 to A2 = LOW	C0h
PSC0 subaddress + Auto-Increment	12h
Set prescaler PSC0 to achieve a period of 1 second: $\text{Blink period} = 1 = \frac{\text{PSC0} + 1}{44}$	2Bh
PSC0 = 43	
Set PWM0 duty cycle to 50 %: $\frac{256 - \text{PWM0}}{256} = 0.5$	80h
PWM0 = 128	
Set prescaler PCS1 to achieve a period of 0.25 seconds: $\text{Blink period} = 0.25 = \frac{\text{PSC1} + 1}{44}$	0Ah
PSC1 = 10	
Set PWM1 output duty cycle to 25 %: $\frac{256 - \text{PWM1}}{256} = 0.25$	C0h
PWM1 = 192	
Set LED0 to LED3 on	00h
Set LED4 and LED5 to PWM0, and LED6 or LED7 to PWM1	FAh
Set LED8 to LED11 off	55h
Set LED12 to LED15 off	55h
STOP	P

9. Limiting values

Table 12: Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
V _{DD}	supply voltage		−0.5	+6.0	V
V _{I/O}	voltage on an input/output pin	LEDn used as an I/O	V _{SS} − 0.5	5.5	V

I _{LI}	input leakage current		-1	-	+1	μA
C _i	input capacitance	V _I = V _{SS}	-	2.3	5	pF

- [1] All typical values at 3.3 V and 25 °C.
- [2] V_{DD} must be lowered to 0.2 V in order to reset part.
- [3] Each I/O must be externally limited to a maximum of 25 mA and each octal ([LED0 to LED7] and [LED8 to LED15]) must be limited to a maximum current of 100 mA for a device total of 200 mA.

11. Dynamic characteristics

Table 14: Dynamic characteristics

Symbol	Parameter	Conditions	Standard mode I ² C-bus		Fast mode I ² C-bus		Unit
			Min	Max	Min	Max	
f _{SCL}	SCL clock frequency		0	100	0	400	kHz
t _{BUF}	bus free time between a STOP and START condition		4.7	-	1.3	-	μs
t _{HD;STA}	hold time (repeated) START condition		4.0	-	0.6	-	μs
t _{SU;STA}	set-up time for a repeated START condition		4.7	-	0.6	-	μs
t _{SU;STO}	set-up time for STOP condition		4.0	-	0.6	-	μs
t _{HD;DAT}	data hold time		0	-	0	-	ns
t _{VD;ACK}	data valid acknowledge time		[1]	-	600	-	ns
t _{VD;DAT}	data valid time	LOW-level	[2]	-	600	-	ns
		HIGH-level	[2]	-	1500	-	ns
t _{SU;DAT}	data set-up time		250	-	100	-	ns
t _{LOW}	LOW period of the SCL clock		4.7	-	1.3	-	μs
t _{HIGH}	HIGH period of the SCL clock		4.0	-	0.6	-	μs
t _f	fall time of both SDA and SCL signals		-	300	20 + 0.1C _b [3]	300	ns
t _r	rise time of both SDA and SCL signals		-	1000	20 + 0.1C _b [3]	300	ns
t _{SP}	pulse width of spikes that must be suppressed by the input filter		-	50	-	50	ns
Port timing							
t _{V(Q)}	data output valid time		-	250	-	250	ns
t _{SU(D)}	data input setup time		100	-	100	-	ns
t _{H(D)}	data input hold time		1	-	1	-	μs
Reset							
t _{W(rst)}	reset pulse width		10	-	10	-	ns
t _{rec(rst)}	reset recovery time		0	-	0	-	ns
t _{rst}	reset time	[4] [5]	400	-	400	-	ns

[1] t_{VD;ACK} = time for Acknowledgement signal from SCL LOW to SDA (out) LOW.

[2] t_{VD;DAT} = minimum time for SDA data out to be valid following SCL LOW.

[3] C_b = total capacitance of one bus line in pF.

[4] Resetting the device while actively communicating on the bus may cause glitches or errant STOP conditions.

[5] Upon reset, the full delay will be the sum of t_{rst} and the RC time constant of the SDA bus.

Fig 19. Definition of timing on the I²C-bus

Rise and fall times refer to V_{IL} and V_{IH} .

Fig 20. I²C-bus timing diagram

Fig 21. Reset timing

12. Test information

R_L = load resistor for LEDn. R_L for SDA and SCL > 1 kΩ (3 mA or less current)

C_L = load capacitance includes jig and probe capacitance

R_T = termination resistance should be equal to the output impedance Z_o of the pulse generators.

14. Handling information

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be completely safe you must take normal precautions appropriate to handling integrated circuits.

15. Soldering

15.1 Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *Data Handbook IC26; Integrated Circuit Packages* (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

15.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 seconds and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 °C to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 225 °C (SnPb process) or below 245 °C (Pb-free process)
 - for all BGA, HTSSON..T and SSOP..T packages
 - for packages with a thickness ≥ 2.5 mm
 - for packages with a thickness < 2.5 mm and a volume ≥ 350 mm³ so called thick/large packages.
- below 240 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness < 2.5 mm and a volume < 350 mm³ so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

15.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
 - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
 - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 seconds to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

15.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 seconds to 5 seconds between 270 °C and 320 °C.

15.5 Package related soldering information

Table 15: Suitability of surface mount IC packages for wave and reflow soldering methods

Package ^[1]	Soldering method	
	Wave	Reflow ^[2]
BGA, HTSSON..T ^[3] , LBGA, LFBGA, SQFP, SSOP..T ^[3] , TFBGA, VFBGA, XSON	not suitable	suitable
DHVQFN, HBCC, HBGA, HLQFP, HSO, HSOP, HSQFP, HSSON, HTQFP, HTSSOP, HVQFN, HVSON, SMS	not suitable ^[4]	suitable
PLCC ^[5] , SO, SOJ	suitable	suitable
LQFP, QFP, TQFP	not recommended ^[5] ^[6]	suitable
SSOP, TSSOP, VSO, VSSOP	not recommended ^[7]	suitable
CWQCCN..L ^[8] , PMFP ^[9] , WQCCN..L ^[8]	not suitable	not suitable

[1] For more detailed information on the BGA packages refer to the *(LF)BGA Application Note* (AN01026); order a copy from your Philips Semiconductors sales office.

- [2] All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the *Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods*.
- [3] These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding $217\text{ }^{\circ}\text{C} \pm 10\text{ }^{\circ}\text{C}$ measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.
- [4] These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
- [5] If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- [6] Wave soldering is suitable for LQFP, QFP and TQFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- [7] Wave soldering is suitable for SSOP, TSSOP, VSO and VSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.
- [8] Image sensor packages in principle should not be soldered. They are mounted in sockets or delivered pre-mounted on flex foil. However, the image sensor package can be mounted by the client on a flex foil by using a hot bar soldering process. The appropriate soldering profile can be provided on request.
- [9] Hot bar soldering or manual soldering is suitable for PMFP packages.

16. Abbreviations

Table 16: Abbreviations

Acronym	Description
CDM	Charged Device Model
DSP	Digital Signal Processor
ESD	ElectroStatic Discharge
HBM	Human Body Model
GPIO	General Purpose Input/Output
IC	Integrated Circuit
I ² C-bus	Inter IC bus
LED	Light Emitting Diode
MCU	Microcontroller
MM	Machine Model
MPU	Microprocessor
POR	Power-On Reset
PWM	Pulse Width Modulation
SMBus	System Management Bus

17. Revision history

Table 17: Revision history

Document ID	Release date	Data sheet status	Change notice	Doc. number	Supersedes
PCA9552_5	20060309	Product data sheet	-	-	PCA9552_4
Modifications: - The format of this data sheet has been redesigned to comply with the new presentation and information standard of Philips Semiconductors. Table 1 "Ordering information": changed Topside mark of TSSOP24 package from 'PCA9552PW' to 'PCA9552' Table 2 "Pin description": added Table note 1 regarding V_{SS} pin on HVQFN24 package Section 6.6 "External RESET": changed symbol "t_W" to "t_{W(rst)}" Figure 11: changed symbol "t_{pV}" to "t_{V(Q)}" Figure 13: changed symbol "t_{ph}" to "t_{h(D)}"; changed symbol "t_{ps}" to "t_{su(D)}" Section 8.1 "Minimizing I_{DD} when the I/O is used to control LEDs": 1st paragraph, 3rd sentence: changed symbol "ΔI_{DD}" to "ΔI_{stb}" 2nd paragraph, 4th sentence: changed symbol "V_{IN}" to "V_I" Table 12 "Limiting values": - changed parameter description of V_{I/O} from "DC voltage on an I/O" to "voltage on an input/output pin" - changed symbol "I_{I/O} (DC output current on an I/O)" to 'I_{O(LEDn)} (output current on pin LEDn) Table 13 "Static characteristics": - moved second sentence of description below title to (new) Table note 1 and added its reference at column "Typ" - changed symbol "ΔI_{DD}" to "ΔI_{stb}" - under subsection "I/Os", changed symbol "I_L" to "I_{LI}" Table 14 "Dynamic characteristics": - updated parameter descriptions - under subsection "Port timing": changed symbol "t_{pV}" to "t_{V(Q)}"; changed symbol "t_{ps}" to "t_{su(D)}"; changed symbol "t_{ph}" to "t_{h(D)}" - under subsection "Reset": changed symbol "t_W" to "t_{W(rst)}"; changed symbol "t_{REC}" to "t_{rec(rst)}"; changed symbol "t_{RESET}" to "t_{rst}" (also in Table note 5) Figure 21 "Reset timing" modified to harmonize letter symbols

18. Data sheet status

Level	Data sheet status ^[1]	Product status ^{[2] [3]}	Definition
I	Objective data	Development	This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice.
II	Preliminary data	Qualification	This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.
III	Product data	Production	This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN).

[1] Please consult the most recently issued data sheet before initiating or completing a design.

[2] The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL <http://www.semiconductors.philips.com>.

[3] For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status.

19. Definitions

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes in the products - including circuits, standard cells, and/or software - described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.

21. Trademarks

Notice — All referenced brands, product names, service names and trademarks are the property of their respective owners.

I²C-bus — logo is a trademark of Koninklijke Philips Electronics N.V.

20. Disclaimers

Life support — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors
