Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Only one absolute maximum rating can be applied at any one time.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

NOTES
1. THE EXPOSED PAD MUST BE CONNECTED TO THE RF/DC GROUND OF THE PRINTED CIRCUIT BOARD (PCB).

THEORY OF OPERATION

The HMC349AMS8G requires a positive supply voltage applied to the VDD pin. Bypassing capacitors are recommended on the supply lines to minimize RF coupling.

The HMC349AMS8G is internally matched to 50 Ω at the RF common port (RFC) and the RF throw ports (RF1 and RF2); therefore, no external matching components are required. All of the RF ports are dc-coupled and dc blocking capacitors are required at the RF ports. The design is bidirectional; the RF input signal can be applied to the RFC port while the RF throw port (RF1 or RF2) is output, or vice versa.

The HMC349AMS8G incorporates a driver to perform logic functions internally and to provide the user with the advantage of a simplified control interface. The driver features two digital control input pins, CTRL and EN.

When the EN pin is logic low, the RF1 to RFC path is in an insertion loss state, and the RF2 to RFC path is in an isolation state, or vice versa, depending on the logic level applied to the CTRL pin. The insertion loss path (for example, RF1 to RFC) conducts the RF signal equally well in both directions between the throw port (for example, RF1) and the common port (RFC).

The isolation path (for example, RF2 to RFC) provides high loss between the insertion loss path and the throw port (for example, RF2) terminated to an internal 50 Ω resistor.

When the EN pin is logic high, both the RF1 to RFC path and the RF2 to RFC path are in an isolation state, regardless of the logic state of CTRL. The RF1 and RF2 ports are terminated to internal 50 Ω resistors, and RFC becomes open reflective.

The ideal power-up sequence is as follows:

1. Connect GND.
2. Power up VDD.
3. Power up the digital control inputs. The relative order of the logic control inputs is not important. However, powering the digital control inputs before the VDD supply can inadvertently forward bias and damage the internal ESD protection structures.
4. Apply an RF input signal. The design is bidirectional; the RF input signal can be applied to the RFC port while the RF throw ports are outputs, or vice versa. All of the RF ports are dc-coupled to VDD through internal resistors; therefore, dc blocking capacitors are required at the RF ports.

Table 4. Control Voltage Truth Table

Digital Control Input		RF Paths	
EN	CTRL	RF1 to RFC	RF2 to RFC
Low	Low	Isolation (off)	Insertion loss (on)
Low	High	Insertion loss (on)	Isolation (off)
High	Low	Isolation (off)	Isolation (off)
High	High	Isolation (off)	Isolation (off)
