

- A/V connectivity and navigation:
 - Includes audio connectivity and telematics features
 - Map display and route calculation
 - QVGA video decode, WVGA video display
 - Sophisticated graphical user interface

The i.MX35 processor takes advantage of the ARM1136JF-S™ core running at 532 MHz that is boosted by a multilevel cache system, and features peripheral devices such as an autonomous image processing unit, a vector floating point (VFP11) co-processor, and a RISC-based DMA controller.

The i.MX35 supports connections to various types of external memories, such as SDRAM, mobile DDR and DDR2, SLC and MLC NAND Flash, NOR Flash and SRAM. The device can be connected to a variety of external devices such as high-speed USB2.0 OTG, ATA, MMC/SDIO, and Compact Flash.

1.1 Features

The i.MX35 is designed for automotive infotainment video-enabled applications. It provides low-power solutions for applications demanding high-performance multimedia and graphics.

The i.MX35 is based on the ARM1136 platform, which has the following features:

- ARM1136JF-S processor, version r1p3
- 16-Kbyte L1 instruction cache
- 16-Kbyte L1 data cache
- 128-Kbyte L2 cache, version r0p4
- 128 Kbytes of internal SRAM
- Vector floating point unit (VFP11)

To boost multimedia performance, the following hardware accelerators are integrated:

- Image processing unit (IPU)
- OpenVG 1.1 graphics processing unit (GPU) (not available for the MCIMX351)

The MCIMX35 provides the following interfaces to external devices (some of these interfaces are muxed and not available simultaneously):

- 2 controller area network (CAN) interfaces
- 2 SDIO/MMC interfaces, 1 SDIO/CE-ATA interface (CE-ATA is not available for the MCIMX351)
- 32-bit mobile DDR, DDR2 (4-bank architecture), and SDRAM (up to 133 MHz)
- 2 configurable serial peripheral interfaces (CSPI) (up to 52 Mbps each)
- Enhanced serial audio interface (ESAI)
- 2 synchronous serial interfaces (SSI)
- Ethernet MAC 10/100 Mbps
- 1 USB 2.0 host with ULPI interface or internal full-speed PHY. Up to 480 Mbps if external HS PHY is used.
- 1 USB 2.0 OTG (up to 480 Mbps) controller with internal high-speed OTG PHY

- Flash controller—MLC/SLC NAND and NOR
- GPIO with interrupt capabilities
- 3 I²C modules (up to 400 Kbytes each)
- JTAG
- Key pin port
- Media local bus (MLB) interface
- Asynchronous sample rate converter (ASRC)
- 1-Wire
- Parallel camera sensor (4/8/10/16-bit data port for video color models: YCC, YUV, 30 Mpixels/s)
- Parallel display (primary up to 24-bit, 1024 x 1024)
- Parallel ATA (up to 66 Mbytes) (not available for the MCIMX351)
- PWM
- SPDIF transceiver
- 3 UART (up to 4.0 Mbps each)

2 Functional Description and Application Information

The i.MX35 consists of the following major subsystems:

- ARM1136 Platform—AP domain
- SDMA Platform and EMI—Shared domain

2.1 Application Processor Domain Overview

The applications processor (AP) and its domain are responsible for running the operating system and applications software, providing the user interface, and supplying access to integrated and external peripherals. The AP domain is built around an ARM1136JF-S core with 16-Kbyte instruction and data L1 caches, an MMU, a 128-Kbyte L2 cache, a multiported crossbar switch, and advanced debug and trace interfaces.

The i.MX35 core is intended to operate at a maximum frequency of 532 MHz to support the required multimedia use cases. Furthermore, an image processing unit (IPU) is integrated into the AP domain to offload the ARM11 core from performing functions such as color space conversion, image rotation and scaling, graphics overlay, and pre- and post-processing.

The functionality of AP Domain peripherals includes the user interface; the connectivity, display, security, and memory interfaces; and 128 Kbytes of multipurpose SRAM.

2.2 Shared Domain Overview

The shared domain is composed of the shared peripherals, a smart DMA engine (SDMA) and a number of miscellaneous modules. For maximum flexibility, some peripherals are directly accessible by the SDMA engine.

The i.MX35 has a hierarchical memory architecture including L1 caches and a unified L2 cache. This reduces the bandwidth demands for the external bus and external memory. The external memory subsystem supports a flexible external memory system, including support for SDRAM (SDR, DDR2 and mobile DDR) and NAND Flash.

2.3 Advanced Power Management Overview

To address the continuing need to reduce power consumption, the following techniques are incorporated in the i.MX35:

- Clock gating
- Power gating
- Power-optimized synthesis
- Well biasing

The insertion of gating into the clock paths allows unused portions of the chip to be disabled. Because static CMOS logic consumes only leakage power, significant power savings can be realized.

“Well biasing” is applying a voltage that is greater than V_{DD} to the nwells, and one that is lower than V_{SS} to the pwells. The effect of applying this well back bias voltage reduces the subthreshold channel leakage. For the 90-nm digital process, it is estimated that the subthreshold leakage is reduced by a factor of ten over the nominal leakage. Additionally, the supply voltage for internal logic can be reduced from 1.4 V to 1.22 V.

2.4 ARM11 Microprocessor Core

The CPU of the i.MX35 is the ARM1136JF-S core, based on the ARM v6 architecture. This core supports the ARM Thumb® instruction sets, features Jazelle® technology (which enables direct execution of Java byte codes) and a range of SIMD DSP instructions that operate on 16-bit or 8-bit data values in 32-bit registers.

The ARM1136JF-S processor core features are as follows:

- Integer unit with integral EmbeddedICE™ logic
- Eight-stage pipeline

- Branch prediction with return stack
- Low-interrupt latency
- Instruction and data memory management units (MMUs), managed using micro TLB structures backed by a unified main TLB
- Instruction and data L1 caches, including a non-blocking data cache with hit-under-miss
- Virtually indexed/physically addressed L1 caches
- 64-bit interface to both L1 caches
- Write buffer (bypassable)
- High-speed Advanced Micro Bus Architecture (AMBA)[™] L2 interface
- Vector floating point co-processor (VFP) for 3D graphics and hardware acceleration of other floating-point applications
- ETM[™] and JTAG-based debug support

Table 3 summarizes information about the i.MX35 core.

Table 3. i.MX35 Core

Core Acronym	Core Name	Brief Description	Integrated Memory Features
ARM11 or ARM1136	ARM1136 Platform	The ARM1136 [™] platform consists of the ARM1136JF-S core, the ETM real-time debug modules, a 6 × 5 multi-layer AHB crossbar switch (MAX), and a vector floating processor (VFP). The i.MX35 provides a high-performance ARM11 microprocessor core and highly integrated system functions. The ARM Application Processor (AP) and other subsystems address the needs of the personal, wireless, and portable product market with integrated peripherals, advanced processor core, and power management capabilities.	<ul style="list-style-type: none"> • 16-Kbyte instruction cache • 16-Kbyte data cache • 128-Kbyte L2 cache • 32-Kbyte ROM • 128-Kbyte RAM

2.5 Module Inventory

Table 4 shows an alphabetical listing of the modules in the MCIMX35. For extended descriptions of the modules, see the MCIMX35 reference manual.

Table 4. Digital and Analog Modules

Block Mnemonic	Block Name	Domain ¹	Subsystem	Brief Description
1-WIRE	1-Wire interface	ARM	ARM1136 platform peripherals	1-Wire provides the communication line to a 1-Kbit add-only memory. the interface can send or receive 1 bit at a time.
ASRC	Asynchronous sample rate converter	SDMA	Connectivity peripherals	The ASRC is designed to convert the sampling rate of a signal associated to an input clock into a signal associated to a different output clock. It supports a concurrent sample rate conversion of about –120 dB THD+N. The sample rate conversion of each channel is associated to a pair of incoming and outgoing sampling rates.

Table 4. Digital and Analog Modules (continued)

Block Mnemonic	Block Name	Domain ¹	Subsystem	Brief Description
ATA	ATA module	SDMA	Connectivity peripherals	The ATA block is an AT attachment host interface. Its main use is to interface with IDE hard disk drives and ATAPI optical disk drives. It interfaces with the ATA device over a number of ATA signals.
AUDMUX	Digital audio mux	ARM	Multimedia peripherals	The AUDMUX is a programmable interconnect for voice, audio, and synchronous data routing between host serial interfaces (SSIs) and peripheral serial interfaces (audio codecs). The AUDMUX has two sets of interfaces: internal ports to on-chip peripherals and external ports to off-chip audio devices. Data is routed by configuring the appropriate internal and external ports.
CAN(2)	CAN module	ARM	Connectivity peripherals	The CAN protocol is primarily designed to be used as a vehicle serial data bus running at 1 Mbps.
CCM	Clock control module	ARM	Clocks	This block generates all clocks for the peripherals in the SDMA platform. The CCM also manages ARM1136 platform low-power modes (WAIT, STOP), disabling peripheral clocks appropriately for power conservation, and provides alternate clock sources for the ARM1136 and SDMA platforms.
CSPI(2)	Configurable serial peripheral interface	SDMA, ARM	Connectivity peripherals	This module is a serial interface equipped with data FIFOs; each master/slave-configurable SPI module is capable of interfacing to both serial port interface master and slave devices. The CSPI ready (SPI_RDY) and slave select (SS) control signals enable fast data communication with fewer software interrupts.
ECT	Embedded cross trigger	SDMA, ARM	Debug	ECT (embedded cross trigger) is an IP for real-time debug purposes. It is a programmable matrix allowing several subsystems to interact with each other. ECT receives signals required for debugging purposes (from cores, peripherals, buses, external inputs, and so on) and propagates them (propagation programmed through software) to the different debug resources available within the SoC.
EMI	External memory interface	SDMA	External memory interface	The EMI module provides access to external memory for the ARM and other masters. It is composed of the following main submodules: M3IF—provides arbitration between multiple masters requesting access to the external memory. SDRAM CTRL—interfaces to mDDR, DDR2 (4-bank architecture type), and SDR interfaces. NANDFC—provides an interface to NAND Flash memories. WEIM—interfaces to NOR Flash and PSRAM.
EPIT(2)	Enhanced periodic interrupt timer	ARM	Timer peripherals	Each EPIT is a 32-bit “set-and-forget” timer that starts counting after the EPIT is enabled by software. It is capable of providing precise interrupts at regular intervals with minimal processor intervention. It has a 12-bit prescaler to adjust the input clock frequency to the required time setting for the interrupts, and the counter value can be programmed on the fly.

Table 4. Digital and Analog Modules (continued)

Block Mnemonic	Block Name	Domain ¹	Subsystem	Brief Description
ESAI	Enhanced serial audio interface	SDMA	Connectivity peripherals	The enhanced serial audio interface (ESAI) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, SPDIF transceivers, and other DSPs. The ESAI consists of independent transmitter and receiver sections, each section with its own clock generator.
eSDHCv2 (3)	Enhanced secure digital host controller	ARM	Connectivity peripherals	The eSDHCv2 consists of four main modules: CE-ATA, MMC, SD and SDIO. CE-ATA is a hard drive interface that is optimized for embedded applications of storage. The MultiMediaCard (MMC) is a universal, low-cost, data storage and communication media to applications such as electronic toys, organizers, PDAs, and smart phones. The secure digital (SD) card is an evolution of MMC and is specifically designed to meet the security, capacity, performance, and environment requirements inherent in emerging audio and video consumer electronic devices. SD cards are categorized into Memory and I/O. A memory card enables a copyright protection mechanism that complies with the SDMI security standard. SDIO cards provide high-speed data I/O (such as wireless LAN via SDIO interface) with low power consumption. Note: CE-ATA is not available for the MCIMX351.
FEC	Ethernet	SDMA	Connectivity peripherals	The Ethernet media access controller (MAC) is designed to support both 10 and 100 Mbps Ethernet/IEEE 802.3 networks. An external transceiver interface and transceiver function are required to complete the interface to the media
GPIO(3)	General purpose I/O modules	ARM	Pins	Used for general purpose input/output to external ICs. Each GPIO module supports 32 bits of I/O.
GPT	General purpose timers	ARM	Timer peripherals	Each GPT is a 32-bit free-running or set-and-forget mode timer with a programmable prescaler and compare and capture registers. A timer counter value can be captured using an external event and can be configured to trigger a capture event on either the leading or trailing edges of an input pulse. When the timer is configured to operate in set-and-forget mode, it is capable of providing precise interrupts at regular intervals with minimal processor intervention. The counter has output compare logic to provide the status and interrupt at comparison. This timer can be configured to run either on an external clock or on an internal clock.
GPU2D	Graphics processing unit 2Dv1	ARM	Multimedia peripherals	This module accelerates OpenVG and GDI graphics. Note: Not available for the MCIMX351.

Table 4. Digital and Analog Modules (continued)

Block Mnemonic	Block Name	Domain ¹	Subsystem	Brief Description
I ² C(3)	I ² C module	ARM	ARM1136 platform peripherals	Inter-integrated circuit (I ² C) is an industry-standard, bidirectional serial bus that provides a simple, efficient method of data exchange, minimizing the interconnection between devices. I ² C is suitable for applications requiring occasional communications over a short distance among many devices. The interface operates at up to 100 kbps with maximum bus loading and timing. The I ² C system is a true multiple-master bus, with arbitration and collision detection that prevent data corruption if multiple devices attempt to control the bus simultaneously. This feature supports complex applications with multiprocessor control and can be used for rapid testing and alignment of end products through external connections to an assembly-line computer.
IIM	IC identification module	ARM	Security modules	The IIM provides the primary user-visible mechanism for interfacing with on-chip fuse elements. Among the uses for the fuses are unique chip identifiers, mask revision numbers, cryptographic keys, and various control signals requiring a fixed value.
IOMUX	External signals and pin multiplexing	ARM	Pins	Each I/O multiplexer provides a flexible, scalable multiplexing solution with the following features: <ul style="list-style-type: none"> • Up to eight output sources multiplexed per pin • Up to four destinations for each input pin • Unselected input paths held at constant levels for reduced power consumption
IPUv1	Image processing unit	ARM	Multimedia peripherals	The IPU supports video and graphics processing functions. It also provides the interface for image sensors and displays. The IPU performs the following main functions: <ul style="list-style-type: none"> • Preprocessing of data from the sensor or from the external system memory • Postprocessing of data from the external system memory • Post-filtering of data from the system memory with support of the MPEG-4 (both deblocking and deringing) and H.264 post-filtering algorithms • Displaying video and graphics on a synchronous (dumb or memory-less) display • Displaying video and graphics on an asynchronous (smart) display • Transferring data between IPU sub-modules and to/from the system memory with flexible pixel reformatting
KPP	Keypin port	ARM	Connectivity peripherals	Can be used for either keypin matrix scanning or general purpose I/O.
MLB	Media local bus	ARM	Connectivity peripherals	The MLB is designed to interface to an automotive MOST ring.
OSCAUD	OSC audio reference oscillator	Analog	Clock	The OSCAUDIO oscillator provides a stable frequency reference for the PLLs. This oscillator is designed to work in conjunction with an external 24.576-MHz crystal.

Table 4. Digital and Analog Modules (continued)

Block Mnemonic	Block Name	Domain ¹	Subsystem	Brief Description
OSC24M	OSC24M 24-MHz reference oscillator	Analog	Clock	The signal from the external 24-MHz crystal is the source of the CLK24M signal fed into USB PHY as the reference clock and to the real time clock (RTC).
MPLL PPLL	Digital phase-locked loops	SDMA	Clocks	DPLLs are used to generate the clocks: MCU PLL (MPLL)—programmable Peripheral PLL (PPLL)—programmable
PWM	Pulse-width modulator	ARM	ARM1136 platform peripherals	The pulse-width modulator (PWM) is optimized to generate sound from stored sample audio images; it can also generate tones.
RTC	Real-time clock	ARM	Clocks	Provides the ARM1136 platform with a clock function (days, hours, minutes, seconds) and includes alarm, sampling timer, and minute stopwatch capabilities.
SDMA	Smart DMA engine	SDMA	System controls	The SDMA provides DMA capabilities inside the processor. It is a shared module that implements 32 DMA channels and has an interface to connect to the ARM1136 platform subsystem, EMI interface, and the peripherals.
SJC	Secure JTAG controller	ARM	Pins	The secure JTAG controller (SJC) provides debug and test control with maximum security.
SPBA	SDMA peripheral bus arbiter	SDMA	System controls	The SPBA controls access to the SDMA peripherals. It supports shared peripheral ownership and access rights to an owned peripheral.
S/PDIF	Serial audio interface	SDMA	Connectivity peripherals	Sony/Philips digital transceiver interface
SSI(2)	Synchronous serial interface	SDMA, ARM(2)	Connectivity peripherals	The SSI is a full-duplex serial port that allows the processor connected to it to communicate with a variety of serial protocols, including the Freescale Semiconductor SPI standard and the I ² C sound (I ² S) bus standard. The SSIs interface to the AUDMUX for flexible audio routing.
UART(3)	Universal asynchronous receiver/transmitters	ARM (UART1,2) SDMA (UART3)	Connectivity peripherals	Each UART provides serial communication capability with external devices through an RS-232 cable using the standard RS-232 non-return-to-zero (NRZ) encoding format. Each module transmits and receives characters containing either 7 or 8 bits (program-selectable). Each UART can also provide low-speed IrDA compatibility through the use of external circuitry that converts infrared signals to electrical signals (for reception) or transforms electrical signals to signals that drive an infrared LED (for transmission).

Table 4. Digital and Analog Modules (continued)

Block Mnemonic	Block Name	Domain ¹	Subsystem	Brief Description
USBOH	High-speed USB on-the-go	SDMA	Connectivity peripherals	The USB module provides high performance USB on-the-go (OTG) functionality (up to 480 Mbps), compliant with the USB 2.0 specification, the OTG supplement, and the ULPI 1.0 low pin count specification. The module has DMA capabilities handling data transfer between internal buffers and system memory.
WDOG	Watchdog modules	ARM	Timer peripherals	Each module protects against system failures by providing a method of escaping from unexpected events or programming errors. Once activated, the timer must be serviced by software on a periodic basis. If servicing does not take place, the watchdog times out and then either asserts a system reset signal or an interrupt request signal, depending on the software configuration.

3 Signal Descriptions: Special Function Related Pins

Some special functional requirements are supported in the device. The details about these special functions and the corresponding pin names are listed in [Table 5](#).

Table 5. Special Function Related Pins

Function Name	Pin Name	Mux Mode	Detailed Description
External ARM Clock	EXT_ARMCLK	ALT0	External clock input for ARM clock.
External Peripheral Clock	I2C1_CLK	ALT6	External peripheral clock source.
External 32-kHz Clock	CAPTURE	ALT4	External clock input of 32 kHz, used when the internal 24M Oscillator is powered off, which could be configured either from CAPTURE or CSPI1_SS1.
	CSPI1_SS1	ALT2	
Clock Out	CLKO	ALT0	Clock-out pin from CCM, clock source is controllable and can also be used for debug.
Power Ready	GPIO1_0	ALT1	PMIC power-ready signal, which can be configured either from GPIO1_0 or TX1.
	TX1	ALT1	
Tamper Detect	GPIO1_1	ALT6	Tamper-detect logic is used to issue a security violation. This logic is activated if the tamper-detect input is asserted. Tamper-detect logic is enabled by the bit of IOMUXC_GPRA[2]. After enabling the logic, it is impossible to disable it until the next reset.

4 Electrical Characteristics

The following sections provide the device-level and module-level electrical characteristics for the i.MX35 processor.

4.1 i.MX35 Chip-Level Conditions

This section provides the device-level electrical characteristics for the IC. See [Table 6](#) for a quick reference to the individual tables and sections.

Operating ambient temperature range	T _A	−40	—	85	°C
Junction temperature range	T _J	−40	—	105	°C

¹ EMI I/O interface power supply should be set up according to external memory. For example, if using SDRAM then NVCC_EMI1,2,3 should all be set at 3.3 V (typ.). If using MDDR or DDR2, NVCC_EMI1,2,3 must be set at 1.8 V (typ.).

² MLB interface I/O pads can be programmed to function as GPIO by setting NVCC_MLB to 1.8 or 3.3 V, but if used as MLB pads, NVCC_MLB must be set to 2.5 V in order to be compliant with external MOST devices. NVCC_MLB may be left floating.

³ The Fusebox read supply is connected to supply of the full speed USB PHY. FUSE_VDD is only used for programming. It is recommended that FUSE_VDD be connected to ground when not being used for programming. FUSE_VDD should be supplied by following the power up sequence given in Section 4.3.1, “Powering Up.”

4.3 Supply Power-Up/Power-Down Requirements and Restrictions

This section provides power-up and power-down sequence guidelines for the i.MX35 processor.

CAUTION

Any i.MX35 board design must comply with the power-up and power-down sequence guidelines as described in this section to guarantee reliable operation of the device. Any deviation from these sequences can result in irreversible damage to the i.MX35 processor (worst-case scenario).

NOTE

Deviation from these sequences may also result in one or more of the following:

- Excessive current during power-up phase
- Prevent the device from booting
- Programming of unprogrammed fuses

4.3.1 Powering Up

The power-up sequence should be completed as follows:

1. Assert Power on Reset ($\overline{\text{POR}}$).
2. Turn on digital logic domain and IO power supply: VDD_n , NVCC_x
3. Wait until VDD_n and NVCC_x power supplies are stable + 32 μs .
4. Turn on all other power supplies: PHY1_VDDA , USBPHY1_VDDA_BIAS , PHY2_VDD , USBPHY1_UPLLVD , OSC24M_VDD , OSC_AUDIO_VDD , MVDD , PVDD , FUSEVDD . (Always FUSE_VDD should be connected to ground, except when eFuses are to be programmed.)
5. Wait until PHY1_VDDA , USBPHY1_VDDA_BIAS , PHY2_VDD , USBPHY1_UPLLVD , OSC24M_VDD , OSC_AUDIO_VDD , MVDD , PVDD , (FUSEVDD , optional). Power supplies are stable + 100 μs .
6. Deassert the $\overline{\text{POR}}$ signal.

Figure 2 shows the power-up sequence and timing.

Figure 2. i.MX35 Power-Up Sequence and Timing

4.3.2 Powering Down

The power-up sequence in reverse order is recommended for powering down. However, all power supplies can be shut down at the same time.

4.4 Reset Timing

There are two ways of resetting the i.MX35 using external pins:

- Power On Reset (using the POR_B pin)
- System Reset (using the RESET_IN_B pin)

4.4.1 Power On Reset

POR_B is normally connected to a power management integrated circuit (PMIC). The PMIC asserts POR_B while the power supplies are turned on and negates POR_B after the power up sequence is finished. See Figure 2.

Assuming the i.MX35 chip is already fully powered; it is still possible to reset all of the modules to their default reset by asserting POR_B for at least 4 CKIL cycles and later de-asserting POR_B. This method of resetting the i.MX35 can also be supported by tying the POR_B and RESET_IN_B pins together.

Figure 3. Timing Between POR_B and CKIL for Complete Reset of i.MX35

4.4.2 System Reset

System reset can be achieved by asserting RESET_IN_B for at least 4 CKIL cycles and later negating RESET_IN_B. The following modules are not reset upon system reset: RTC, PLLs, CCM, and IIM. POR_B pin must be deasserted all the time.

Figure 4. Timing Between RESET_IN_B and CKIL for i.MX35 System Reboot

4.5 Power Characteristics

The table shows values representing maximum current numbers for the i.MX35 under worst case voltage and temperature conditions. These values are derived from the i.MX35 with core clock speeds up to 532 MHz. Common supplies have been bundled according to the i.MX35 power-up sequence requirements. Peak numbers are provided for system designers so that the i.MX35 power supply requirements will be satisfied during startup and transient conditions. Freescale recommends that system current measurements be taken with customer-specific use-cases to reflect normal operating conditions in the end system.

Table 11. Power Consumption

Power Supply	Voltage (V)	Max Current (mA)
QVCC	1.47	400
MVDD, PVDD	1.65	20
NVCC_EMI1, NVCC_EMI2, NVCC_EMI3, NVCC_LCDC, NVCC_NFC	1.9	90
FUSE_VDD ¹	3.6	62
NVCC_MISC, NVCC_CSI, NVCC_SDIO, NVCC_CRM, NVCC_ATA, NVCC_MLB, NVCC_JTAG	3.6	60
OSC24M_VDD, OSC_AUDIO_VDD, PHY1_VDDA, PHY2_VDD, USBPHY1_UPLLVD, USBPHY1_VDDA_BIAS	3.6	25

¹ This rail is connected to ground; it only needs a voltage if eFuses are to be programmed. FUSE_VDD should be supplied by following the power up sequence given in [Section 4.3.1, "Powering Up."](#)

The method for obtaining max current is as follows:

1. Measure worst case power consumption on individual rails using directed test on i.MX35.
2. Correlate worst case power consumption power measurements with worst case power consumption simulations.
3. Combine common voltage rails based on power supply sequencing requirements
4. Guard band worst case numbers for temperature and process variation. Guard band is based on process data and correlated with actual data measured on i.MX35.
5. The sum of individual rails is greater than real world power consumption, as a real system does not typically maximize power consumption on all peripherals simultaneously.

4.6 Thermal Characteristics

The thermal resistance characteristics for the device are given in [Table 12](#). These values were measured under the following conditions:

- Two-layer substrate
- Substrate solder mask thickness: 0.025 mm
- Substrate metal thicknesses: 0.016 mm
- Substrate core thickness: 0.200 mm
- Core via I.D: 0.168 mm, Core via plating 0.016 mm.
- Full array map design, but nearly all balls under die are power or ground.
- Die Attach: 0.033 mm non-conductive die attach, $k = 0.3 \text{ W/m K}$
- Mold compound: $k = 0.9 \text{ W/m K}$

⁴ Thermal characterization parameter indicating the temperature difference between the package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, this thermal characterization parameter is written as Psi-JT.

4.7 I/O Pin DC Electrical Characteristics

I/O pins are of two types: GPIO and DDR. DDR pins can be configured in three different drive strength modes: mobile DDR, SDRAM, and DDR2. The SDRAM and mobile DDR modes can be further customized at three drive strength levels: normal, high, and max.

Table 13 shows currents for the different DDR pin drive strength modes.

Table 13. DDR Pin Drive Strength Mode Current Levels

Drive Mode	Normal	High	Max.
Mobile DDR (1.8 V)	3.6 mA	7.2 mA	10.8 mA
SDRAM (1.8 V)	—	—	6.5 mA
SDRAM (3.3 V)	4 mA	8 mA	12 mA
DDR2 (1.8 V)	—	—	13.4 mA

Table 14 shows the DC electrical characteristics for GPIO, DDR2, mobile DDR, and SDRAM pins. The term NVCC refers to the power supply voltage that feeds the I/O of the module in question. For example, NVCC for the SD/MMC interface refers to NVCC_SDIO.

4.8.1 AC Electrical Test Parameter Definitions

AC electrical characteristics in Table 16 through Table 21 are not applicable for the output open drain pull-down driver.

The dI/dt parameters are measured with the following methodology:

- The zero voltage source is connected between pin and load capacitance.
- The current (through this source) derivative is calculated during output transitions.

4.9 Module-Level AC Electrical Specifications

This section contains the AC electrical information (including timing specifications) for the modules of the i.MX35. The modules are listed in alphabetical order.

4.9.1 AUDMUX Electrical Specifications

The AUDMUX provides a programmable interconnect logic for voice, audio and data routing between internal serial interfaces (SSI) and external serial interfaces (audio and voice codecs). The AC timing of AUDMUX external pins is hence governed by the SSI module. See the electrical specification for SSI.

4.9.2 CSPI AC Electrical Specifications

The i.MX35 provides two CSPI modules. CSPI ports are multiplexed in the i.MX35 with other pins. See the “External Signals and Multiplexing” chapter of the reference manual for more details.

Figure 7 and Figure 8 depict the master mode and slave mode timings of the CSPI, and Table 27 lists the timing parameters.

4.9.3 DPLL Electrical Specifications

There are three PLLs inside the i.MX35, all based on the same PLL design. The reference clock for these PLLs is normally generated from an external 24-MHz crystal connected to an internal oscillator via EXTAL24M and XTAL24 pins. It is also possible to connect an external 24-MHz clock directly to EXTAL24M, bypassing the internal oscillator.

DPLL specifications are listed in [Table 28](#).

Table 28. DPLL Specifications

Parameter	Min.	Typ.	Max.	Unit	Comments
Reference clock frequency	10	24	100	MHz	
Max. allowed reference clock phase noise	—	—	0.03 0.01 0.15	2 Tdck ¹	Fmodulation < 50 kHz 50 kHz < Fmodulation 300 Hz Fmodulation > 300 KHz
Frequency lock time (FOL mode or non-integer MF)	—	—	80	μs	—

Max. allowed PL voltage ripple	—	—	150 100 150	mV	Fmodulation < 50 kHz 50 kHz < Fmodulation 300 Hz Fmodulation > 300 KHz

¹ There are two PLL are used in the i.MX35, MPLL and PLL. Both are based on same DPLL design.

If crystals are used instead of external oscillators, they should meet the following specifications:

Table 29. Clock Input Tolerance

4.9.4 Embedded Trace Macrocell (ETM) Electrical Specifications

ETM is an ARM protocol. The timing specifications in this section are given as a guide for a test point access (TPA) that supports TRACECLK frequencies up to 133 MHz.

Figure 9 depicts the TRACECLK timings of ETM, and Table 30 lists the timing parameters.

4.9.4.1 Half-Rate Clocking Mode

When half-rate clocking is used, the trace data signals are sampled by the TPA on both the rising and falling edges of TRACECLK, where TRACECLK is half the frequency of the clock shown in Figure 10. The same T_s and T_h parameters from Table 31 still apply with respect to the falling edge of the TRACECLK signal.

4.9.5 EMI Electrical Specifications

This section provides electrical parametrics and timing for the EMI module.

4.9.5.1 NAND Flash Controller Interface (NFC)

The i.MX35 NFC supports normal timing mode, using two flash clock cycles for one access of \overline{RE} and \overline{WE} . AC timings are provided as multiplications of the clock cycle and fixed delay. Figure 11, Figure 12, Figure 13, and Figure 14 depict the relative timing requirements among different signals of the NFC at module level for normal mode. Table 32 lists the timing parameters.

¹ The flash clock maximum frequency is 50 MHz.

² Subject to DPLL jitter specification listed in [Table 28, "DPLL Specifications,"](#) on page 32.

NOTE

High is defined as 80% of signal value and low is defined as 20% of signal value.

Timing for HCLK is 133 MHz and internal NFC clock (flash clock) is approximately 33 MHz (30 ns). All timings are listed according to this NFC clock frequency (multiples of NFC clock phases), except NF16 and NF17, which are not NFC clock related.

4.9.5.2 Wireless External Interface Module (WEIM)

All WEIM output control signals may be asserted and deasserted by internal clocks related to the BCLK rising edge or falling edge according to the corresponding assertion or negation control fields. The address always begins related to BCLK falling edge but may be ended both on rising and falling edge in muxed mode according to control register configuration. Output data begins related to BCLK rising edge except in muxed mode where both rising and falling edge may be used according to control register configuration.

Input data, $\overline{\text{ECB}}$ and $\overline{\text{DTACK}}$ all captured according to BCLK rising edge time. Figure 15 depicts the timing of the WEIM module, and Table 33 lists the timing parameters.

¹ “High” is defined as 80% of signal value, and “low” is defined as 20% of signal value.

² BCLK parameters are measured from the 50% point. For example, “high” is defined as 50% of signal value and “low” is defined as 50% of signal value.

³ Parameters W18, W20, W22, and W24 are tested when FCE=1. i.MX35 does not support FCE=0.

NOTE

Test conditions: load capacitance, 25 pF. Recommended drive strength for all controls, address, and BCLK is set to maximum drive.

Recommended drive strength for all controls, address and BCLK is set to maximum drive.

¹ Timing parameters are relevant only to SDR SDRAM. For the specific DDR SDRAM data related timing parameters, see [Table 44](#) and [Table 45](#).

NOTE

SDR SDRAM CLK parameters are measured from the 50% point—that is, high is defined as 50% of signal value and low is defined as 50% of signal value. SD1 + SD2 does not exceed 7.5 ns for 133 MHz.

The timing parameters are similar to the ones used in SDRAM data sheets—that is, [Table 35](#) indicates SDRAM requirements. All output signals are driven by the ESDCTL at the negative edge of SDCLK and the parameters are measured at maximum memory frequency.

NOTE

Test conditions are: pin voltage 1.7 V–1.95 V, capacitance 15 pF for all pins (both DDR and non-DDR pins), drive strength is high (7.2 mA). “High” is defined as 80% of signal value and “low” is defined as 20% of signal value.

SDR SDRAM CLK parameters are measured from the 50% point—that is, “high” is defined as 50% of signal value, and “low” is defined as 50% of signal value. $t_{CH} + t_{CL}$ will not exceed 7.5 ns for 133 MHz. DDR SDRAM CLK parameters are measured at the crossing point of SDCLK and \overline{SDCLK} (inverted clock).

The timing parameters are similar to the ones used in SDRAM data sheets. [Table 36](#) indicates SDRAM requirements. All output signals are driven by the ESDCTL at the negative edge of SDCLK, and the parameters are measured at maximum memory frequency.

- ¹ i ck = internal clock
x ck = external clock
i ck a = internal clock, asynchronous mode
(asynchronous implies that SCKT and SCKR are two different clocks)
i ck s = internal clock, synchronous mode
(synchronous implies that SCKT and SCKR are the same clock)

- ² bl = bit length
wl = word length
wr = word length relative

4.9.7 eSDHCv2 AC Electrical Specifications

Figure 38 depicts the timing of eSDHCv2, and Table 47 lists the eSDHCv2 timing characteristics. The following definitions apply to values and signals described in Table 47:

- LS: low-speed mode. Low-speed card can tolerate a clock up to 400 kHz.
- FS: full-speed mode. For a full-speed MMC card, the card clock can reach 20 MHz; a full-speed SD/SDIO card can reach 25 MHz.
- HS: high-speed mode. For a high-speed MMC card, the card clock can reach 52 MHz; SD/SDIO can reach 50 MHz.

¹ In low-speed mode, the card clock must be lower than 400 kHz, voltage ranges from 2.7 to 3.6 V.

² In normal-speed mode for the SD/SDIO card, clock frequency can be any value between 0–25 MHz. In high-speed mode, clock frequency can be any value between 0–50 MHz.

³ In normal-speed mode for MMC card, clock frequency can be any value between 0 and 20 MHz. In high-speed mode, clock frequency can be any value between 0–52 MHz.

⁴ To satisfy hold timing, the delay difference between clock input and cmd/data input must not exceed 2 ns.

4.9.8 Fast Ethernet Controller (FEC) AC Electrical Specifications

This section describes the electrical information of the FEC module. The FEC is designed to support both 10- and 100-Mbps Ethernet networks. An external transceiver interface and transceiver function are required to complete the interface to the media. The FEC supports the 10/100 Mbps Media Independent Interface (MII) using a total of 18 pins. The 10-Mbps 7-wire interface that is restricted to a 10-Mbps data rate uses seven of the MII pins for connection to an external Ethernet transceiver.

4.9.8.1 FEC AC Timing

This section describes the AC timing specifications of the FEC. The MII signals are compatible with transceivers operating at a voltage of 3.3 V.

4.9.8.2 MII Receive Signal Timing

The MII receive timing signals consist of FEC_RXD[3:0], FEC_RX_DV, FEC_RX_ER, and FEC_RX_CLK. The receiver functions correctly up to a FEC_RX_CLK maximum frequency of 25 MHz + 1%. There is no minimum frequency requirement. Additionally, the processor clock frequency must exceed twice the FEC_RX_CLK frequency. [Table 48](#) lists MII receive channel timings.

Table 48. MII Receive Signal Timing

Num.	Characteristic ¹	Min.	Max.	Unit
M1	FEC_RXD[3:0], FEC_RX_DV, FEC_RX_ER to FEC_RX_CLK setup	5	—	ns

M3	FEC_RX_CLK pulse width high	35%	65%	FEC_RX_CLK period
M4	FEC_RX_CLK pulse width low	35%	65%	FEC_RX_CLK period

¹ FEC_RX_DV, FEC_RX_CLK, and FEC_RXD0 have the same timing when in 10 Mbps 7-wire interface mode.

[Figure 39](#) shows the MII receive signal timings listed in [Table 48](#).

Figure 39. MII Receive Signal Timing Diagram

4.9.8.3 MII Transmit Signal Timing

The transmitter timing signals consist of FEC_TXD[3:0], FEC_TX_EN, FEC_TX_ER, and FEC_TX_CLK. The transmitter functions correctly up to a FEC_TX_CLK maximum frequency of 25 MHz + 1%. There is no minimum frequency requirement. Additionally, the processor clock frequency must exceed twice the FEC_TX_CLK frequency. Table 49 lists MII transmit channel timings.

Table 49. MII Transmit Signal Timing

¹ FEC_TX_EN, FEC_TX_CLK, and FEC_TXD0 have the same timing when in 10 Mbps 7-wire interface mode.

Figure 40 shows the MII transmit signal timings listed in Table 49.

Figure 40. MII Transmit Signal Timing Diagram

4.9.8.4 MII Asynchronous Inputs Signal Timing

The MII asynchronous timing signals are FEC_CRD and FEC_COL. Table 50 lists MII asynchronous inputs signal timing.

Table 50. MII Asynch Inputs Signal Timing

Num	Characteristic	Min.	Max.	Unit
M9 ¹	FEC_CRD to FEC_COL minimum pulse width	1.5	—	FEC_TX_CLK period

Figure 41 shows MII asynchronous input timings listed in Table 50.

Figure 41. MII Asynch Inputs Timing Diagram

4.9.8.5 MII Serial Management Channel Timing

Serial management channel timing is accomplished using FEC_MDIO and FEC_MDC. The FEC functions correctly with a maximum MDC frequency of 2.5 MHz. Table 51 lists MII serial management channel timings.

The MDC frequency should be equal to or less than 2.5 MHz to be compliant with the IEEE 802.3 MII specification. However the FEC can function correctly with a maximum MDC frequency of 15 MHz.

Table 51. MII Transmit Signal Timing

4.9.9 FIR Electrical Specifications

FIR implements asynchronous infrared protocols (FIR, MIR) defined by IrDA[®] (Infrared Data Association). Refer to the IrDA[®] website for details on FIR and MIR protocols.

4.9.10 FlexCAN Module AC Electrical Specifications

The electrical characteristics are related to the CAN transceiver outside the chip. The i.MX35 has two CAN modules available for systems design. Tx and Rx ports for both modules are multiplexed with other I/O pins. Refer to the IOMUX chapter of the *MCIMX35 Multimedia Applications Processor Reference Manual* to see which pins expose Tx and Rx pins; these ports are named TXCAN and RXCAN, respectively.

4.9.11 I²C AC Electrical Specifications

This section describes the electrical characteristics of the I²C module.

4.9.11.1 I²C Module Timing

Figure 43 depicts the timing of the I²C module. Table 52 lists the I²C module timing parameters.

IC11	Fall time of both I2DAT and I2CLK signals	—	300	—	300	ns
IC12	Capacitive load for each bus line (C _b)	—	400	—	400	pF

¹ A device must internally provide a hold time of at least 300 ns for the I2DAT signal in order to bridge the undefined region of the falling edge of I2CLK.

² The maximum hold time has to be met only if the device does not stretch the LOW period (ID IC6) of the I2CLK signal.

³ A fast-mode I²C-bus device can be used in a standard-mode I²C-bus system, but the requirement of set-up time (ID IC7) of 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the I2CLK signal. If such a device does stretch the LOW period of the I2CLK signal, it must output the next data bit to the I2DAT line max_rise_time (ID No IC10) + data_setup_time (ID No IC8) = 1000 + 250 = 1250 ns (according to the Standard-mode I²C-bus specification) before the I2CLK line is released.

4.9.12.2 Functional Description

There are three timing modes supported by the IPU.

4.9.12.2.1 Pseudo BT.656 Video Mode

Smart camera sensors, which typically include image processing capability, support video mode transfer operations. They use an embedded timing syntax to replace the SENS_B_VSYNC and SENS_B_HSYNC signals. The timing syntax is defined by the BT.656 standard.

This operation mode follows the recommendations of the ITU BT.656 specifications. The only control signal used is SENS_B_PIX_CLK. Start-of-frame and active-line signals are embedded in the data stream. An active line starts with a SAV code and ends with an EAV code. In some cases, digital blanking is

inserted in between EAV and SAV code. The CSI decodes and filters out the timing coding from the data stream, thus recovering SENSEB_VSYNC and SENSEB_HSYNC signals for internal use.

4.9.12.2.2 Gated Clock Mode

The SENSEB_VSYNC, SENSEB_HSYNC, and SENSEB_PIX_CLK signals are used in this mode. See Figure 44.

Figure 44. Gated Clock Mode Timing Diagram

A frame starts with a rising edge on SENSEB_VSYNC (all the timing corresponds to straight polarity of the corresponding signals). Then SENSEB_HSYNC goes to high and hold for the entire line. The pixel clock is valid as long as SENSEB_HSYNC is high. Data is latched at the rising edge of the valid pixel clocks. SENSEB_HSYNC goes to low at the end of the line. Pixel clocks then become invalid and the CSI stops receiving data from the stream. For the next line, the SENSEB_HSYNC timing repeats. For the next frame, the SENSEB_VSYNC timing repeats.

4.9.12.2.3 Non-Gated Clock Mode

The timing is the same as the gated-clock mode (described in Section 4.9.12.2.2, “Gated Clock Mode”), except for the SENSEB_HSYNC signal, which is not used. See Figure 45. All incoming pixel clocks are valid and will cause data to be latched into the input FIFO. The SENSEB_PIX_CLK signal is inactive (states low) until valid data is going to be transmitted over the bus.

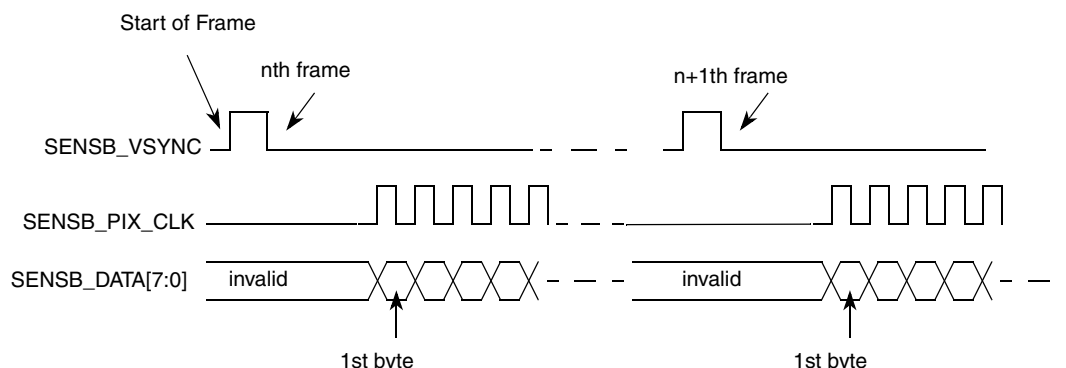

Figure 45. Non-Gated Clock Mode Timing Diagram

The timing described in Figure 45 is that of a Motorola sensor. Some other sensors may have slightly different timing. The CSI can be programmed to support rising/falling-edge triggered SENS_B_VSYNC; active-high/low SENS_B_HSYNC; and rising/falling-edge triggered SENS_B_PIX_CLK.

4.9.13.1 Synchronous Interfaces

This section discusses the interfaces to active matrix TFT LCD panels, Sharp HR-TFT, and dual-port smart displays.

4.9.13.1.4 Interface to Active Matrix TFT LCD Panels, Functional Description

Figure 47 depicts the LCD interface timing for a generic active matrix color TFT panel. In this figure, signals are shown with negative polarity. The sequence of events for active matrix interface timing is as follows:

- DISPB_D3_CLK latches data into the panel on its negative edge (when positive polarity is selected). In active mode, DISPB_D3_CLK runs continuously.
- DISPB_D3_HSYNC causes the panel to start a new line.
- DISPB_D3_VSYNC causes the panel to start a new frame. It always encompasses at least one HSYNC pulse.
- DISPB_D3_DRDY acts like an output enable signal to the CRT display. This output enables the data to be shifted to the display. When disabled, the data is invalid and the trace is off.

4.9.13.3.6 Interface to a TV Encoder—Functional Description

The interface has an 8-bit data bus, transferring a single 8-bit value (Y/U/V) in each cycle. The bits D7–D0 of the value are mapped to bits LD17–LD10 of the data bus, respectively. [Figure 52](#) depicts the interface timing.

- The frequency of the clock DISPB_D3_CLK is 27 MHz.
- The DISPB_D3_HSYNC, DISPB_D3_VSYNC and DISPB_D3_DRDY signals are active low.
- The transition to the next row is marked by the negative edge of the DISPB_D3_HSYNC signal. It remains low for a single clock cycle.
- The transition to the next field/frame is marked by the negative edge of the DISPB_D3_VSYNC signal. It remains low for at least one clock cycle.
 - At a transition to an odd field (of the next frame), the negative edges of DISPB_D3_VSYNC and DISPB_D3_HSYNC coincide.
 - At a transition to an even field (of the same frame), they do not coincide.
- The active intervals—during which data is transferred—are marked by the DISPB_D3_HSYNC signal being high.

4.9.13.4 Asynchronous Interfaces

This section discusses the asynchronous parallel and serial interfaces.

4.9.13.4.8 Parallel Interfaces, Functional Description

The IPU supports the following asynchronous parallel interfaces:

- System 80 interface
 - Type 1 (sampling with the chip select signal) with and without byte enable signals.
 - Type 2 (sampling with the read and write signals) with and without byte enable signals.
- System 68k interface
 - Type 1 (sampling with the chip select signal) with or without byte enable signals.
 - Type 2 (sampling with the read and write signals) with or without byte enable signals.

For each of four system interfaces, there are three burst modes:

1. Burst mode without a separate clock—The burst length is defined by the corresponding parameters of the IDMAC (when data is transferred from the system memory) or by the HBURST signal (when the MCU directly accesses the display via the slave AHB bus). For system 80 and system 68k type 1 interfaces, data is sampled by the CS signal and other control signals change only when transfer direction is changed during the burst. For type 2 interfaces, data is sampled by the WR/RD signals (system 80) or by the ENABLE signal (system 68k), and the CS signal stays active during the whole burst.
2. Burst mode with the separate clock DISPB_BCLK—In this mode, data is sampled with the DISPB_BCLK clock. The CS signal stays active during whole burst transfer. Other controls are changed simultaneously with data when the bus state (read, write or wait) is altered. The CS signals and other controls move to non-active state after burst has been completed.
3. Single access mode—In this mode, slave AHB and DMA burst are broken to single accesses. The data is sampled with CS or other controls according to the interface type as described above. All controls (including CS) become non-active for one display interface clock after each access. This mode corresponds to the ATI single access mode.

Both system 80 and system 68k interfaces are supported for all described modes as depicted in [Figure 53](#), [Figure 54](#), [Figure 55](#), and [Figure 56](#). These timing images correspond to active-low DISPB_Dn_CS, DISPB_Dn_WR and DISPB_Dn_RD signals.

Additionally, the IPU allows a programmable pause between two bursts. The pause is defined in the HSP_CLK cycles. It allows the prevention of timing violation between two sequential bursts or two accesses to different displays. The range of this pause is from 4 to 19 HSP_CLK cycles.

- `DISP#_IF_CLK_DOWN_RD`
- `DISP#_IF_CLK_UP_RD`
- `DISP#_READ_EN`

4.9.13.5 Serial Interfaces, Functional Description

The IPU supports the following types of asynchronous serial interfaces:

- 3-wire (with bidirectional data line)
- 4-wire (with separate data input and output lines)
- 5-wire type 1 (with sampling RS by the serial clock)
- 5-wire type 2 (with sampling RS by the chip select signal)

Figure 62 depicts timing of the 3-wire serial interface. The timing images correspond to active-low `DISPB_D#_CS` signal and the straight polarity of the `DISPB_SD_D_CLK` signal.

For this interface, a bidirectional data line is used outside the device. The IPU still uses separate input and output data lines (`IPP_IND_DISP_B_SD_D` and `IPP_DO_DISP_B_SD_D`). The I/O mux connects the internal data lines to the bidirectional external line according to the `IPP_OBE_DISP_B_SD_D` signal provided by the IPU.

Each data transfer can be preceded by an optional preamble with programmable length and contents. The preamble is followed by read/write (RW) and address (RS) bits. The order of these bits is programmable. The RW bit can be disabled. The following data can consist of one word or of a whole burst. The interface parameters are controlled by the `DI_SER_DISPn_CONF` registers ($n = 1, 2$).

Figure 62. 3-Wire Serial Interface Timing Diagram

Figure 63 depicts timing of the 4-wire serial interface. For this interface, there are separate input and output data lines both inside and outside the device.

¹ The exact conditions have not been finalized, but will likely match the current customer requirement for their specific display. These conditions may be device specific.

² Display interface clock period value for read:

$$T_{dicpr} = T_{HSP_CLK} \cdot \text{ceil} \left[\frac{DISP_IF_CLK_PER_RD}{HSP_CLK_PERIOD} \right]$$

³ Display interface clock period value for write:

$$T_{dicpw} = T_{HSP_CLK} \cdot \text{ceil} \left[\frac{DISP_IF_CLK_PER_WR}{HSP_CLK_PERIOD} \right]$$

⁴ Display interface clock down time for read:

$$T_{dicdr} = \frac{1}{2} T_{HSP_CLK} \cdot \text{ceil} \left[\frac{2 \cdot DISP_IF_CLK_DOWN_RD}{HSP_CLK_PERIOD} \right]$$

⁵ Display interface clock up time for read:

$$T_{dicur} = \frac{1}{2} T_{HSP_CLK} \cdot \text{ceil} \left[\frac{2 \cdot DISP_IF_CLK_UP_RD}{HSP_CLK_PERIOD} \right]$$

⁶ Display interface clock down time for write:

$$T_{dicdw} = \frac{1}{2} T_{HSP_CLK} \cdot \text{ceil} \left[\frac{2 \cdot DISP_IF_CLK_DOWN_WR}{HSP_CLK_PERIOD} \right]$$

⁷ Display interface clock up time for write:

$$T_{dicuw} = \frac{1}{2} T_{HSP_CLK} \cdot \text{ceil} \left[\frac{2 \cdot DISP_IF_CLK_UP_WR}{HSP_CLK_PERIOD} \right]$$

⁸ This parameter is a requirement to the display connected to the IPU.

⁹ Data read point:

$$T_{drp} = T_{HSP_CLK} \cdot \text{ceil} \left[\frac{DISP\#_READ_EN}{HSP_CLK_PERIOD} \right]$$

¹⁰ Loopback delay T_{lbd} is the cumulative propagation delay of read controls and read data. It includes an IPU output delay, a device-level output delay, board delays, a device-level input delay, and an IPU input delay. This value is device specific.

The following parameters are programmed via the DI_DISP#_TIME_CONF_1, DI_DISP#_TIME_CONF_2, and DI_HSP_CLK_PER registers:

- DISP#_IF_CLK_PER_WR
- DISP#_IF_CLK_PER_RD

4.9.17 Parallel ATA Module AC Electrical Specifications

The parallel ATA module can work on PIO/multiword DMA/ultra-DMA transfer modes (not available for the MCIMX351). Each transfer mode has a different data transfer rate, Ultra DMA mode 4 data transfer rate is up to 100 MBps.

The parallel ATA module interface consists of a total of 29 pins. Some pins have different functions in different transfer modes. There are various requirements for timing relationships among the function pins, in compliance with the ATA/ATAPI-6 specification, and these requirements are configurable by the ATA module registers.

4.9.17.1 General Timing Requirements

Table 67 and Figure 74 define the AC characteristics of the interface signals on all data transfer modes.

Table 67. AC Characteristics of All Interface Signals

ID	Parameter	Symbol	Min.	Max.	Unit
SI1	Rising edge slew rate for any signal on the ATA interface ¹	S_{rise}^1	—	1.25	V/ns
SI2	Falling edge slew rate for any signal on the ATA interface ¹	S_{fall}^1	—	1.25	V/ns
SI3	Host interface signal capacitance at the host connector	C_{host}	—	20	pF

¹ SRISE and SFALL meet this requirement when measured at the sender's connector from 10–90% of full signal amplitude with all capacitive loads from 15 pF through 40 pF, where all signals have the same capacitive load value.

ATA Interface Signals

Figure 74. ATA Interface Signals Timing Diagram

4.9.17.2 ATA Electrical Specifications (ATA Bus, Bus Buffers)

This section discusses ATA parameters. For a detailed description, refer to the ATA-6 specification.

Level shifters are required for 3.3-V or 5.0-V compatibility on the ATA interface.

The use of bus buffers introduces delays on the bus and introduces skew between signal lines. These factors make it difficult to operate the bus at the highest speed (UDMA-5) when bus buffers are used. Use of bus buffers is not recommended if fast UDMA mode is required.

The ATA specification imposes a slew rate limit on the ATA bus. According to this limit, any signal driven on the bus should have a slew rate between 0.4 and 1.2 V/ns with a 40 pF load. Few vendors of bus buffers specify the slew rate of the outgoing signals.

When bus buffers are used the ata_data bus buffer is bidirectional, and uses the direction control signal ata_buffer_en. When ata_buffer_en is asserted, the bus should drive from host to device. When

ata_buffer_en is negated, the bus drives from device to host. Steering of the signal is such that contention on the host and device tri-state buses is always avoided.

4.9.17.3 Timing Parameters

Table 68 shows the parameters used in the timing equations. These parameters depend on the implementation of the ATA interface on silicon, the bus buffer used, the cable delay, and the cable skew.

4.9.18 Parallel Interface (ULPI) Timing

Electrical and timing specifications of the parallel interface are presented in the subsequent sections.

Table 74. Signal Definitions—Parallel Interface

Name	Direction	Signal Description
USB_Clk	In	Interface clock. All interface signals are synchronous to the clock.
USB_Data[7:0]	I/O	Bidirectional data bus, driven low by the link during idle. Bus ownership is determined by Dir.
USB_Dir	In	Direction. Control the direction of the data bus.
USB_Stp	Out	Stop. The link asserts this signal for 1 clock cycle to stop the data stream currently on the bus.
USB_Nxt	In	Next. The PHY asserts this signal to throttle the data.

US17	USB_SE0_VM	—	9.0	ns	10 pF

4.9.19 PWM Electrical Specifications

This section describes the electrical information of the PWM. The PWM can be programmed to select one of three clock signals as its source frequency. The selected clock signal is passed through a prescaler before being input to the counter. The output is available at the pulse-width modulator output (PWMO) external

pin. The modulated signal of the module is observed at this pin. It can be viewed as a clock signal whose period and duty cycle can be varied with different settings of the PWM. The smallest period is two `ipg_clk` periods with duty cycle of 50 percent.

4.9.20 SJC Electrical Specifications

This section details the electrical characteristics for the SJC module. [Figure 86](#) depicts the SJC test clock input timing. [Figure 87](#) depicts the SJC boundary scan timing, [Figure 88](#) depicts the SJC test access port, [Figure 89](#) depicts the SJC $\overline{\text{TRST}}$ timing, and [Table 76](#) lists the SJC timing parameters.

¹ On cases where SDMA TAP is put in the chain, the max. TCK frequency is limited by max. ratio of 1:8 of SDMA core frequency to TCK limitation. This implies max. frequency of 8.25 MHz (or 121.2 ns) for 66 MHz IPG clock.

² V_M = mid point voltage

4.9.21 SPDIF Timing

SPDIF data is sent using bi-phase marking code. When encoding, the SPDIF data signal is modulated by a clock that is twice the bit rate of the data signal.

Figure 90 shows SPDIF timing parameters, including the timing of the modulating Rx clock (SRCK) for SPDIF in Rx mode and the timing of the modulating Tx clock (STCLK). for SPDIF in Tx mode.

4.9.22 SSI Electrical Specifications

This section describes electrical characteristics of the SSI.

NOTE

- All of the timing for the SSI is given for a non-inverted serial clock polarity (TSCKP/RSCKP = 0) and a non-inverted frame sync (TFSI/RFSI = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the clock signal STCK/SRCK and/or the frame sync STFS/SRFS shown in the tables and in the figures.
- All timing is on AUDMUX signals when SSI is being used for data transfer.
- “Tx” and “Rx” refer to the transmit and receive sections of the SSI, respectively.
- For internal frame sync operations using the external clock, the FS timing will be the same as that of Tx Data (for example, during AC97 mode of operation).

4.9.22.1 SSI Transmitter Timing with Internal Clock

4.9.23 UART Electrical

This section describes the electrical information of the UART module.

4.9.23.1 UART RS-232 Serial Mode Timing

The following subsections give the UART transmit and receive timings in RS-232 serial mode.

4.9.23.1.11 UART Transmitter

Figure 96 depicts the transmit timing of UART in RS-232 serial mode, with 8 data bit/1 stop bit format. Table 82 lists the UART RS-232 serial mode transmit timing characteristics.

Figure 96. UART RS-232 Serial Mode Transmit Timing Diagram

Table 82. RS-232 Serial Mode Transmit Timing Parameters

ID	Parameter	Symbol	Min.	Max.	Units
UA1	Transmit Bit Time	t_{Tbit}	$\frac{1}{F_{baud_rate}} - \frac{1}{F_{ref_clk}}$ ¹	$\frac{1}{F_{baud_rate}} + \frac{1}{F_{ref_clk}}$	—

¹ F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is (ipg_perclk frequency)/16.

² T_{ref_clk} : The period of UART reference clock ref_clk (ipg_perclk after RFDIV divider).

4.9.23.1.12 UART Receiver

Figure 97 depicts the RS-232 serial mode receive timing, with 8 data bit/1 stop bit format. Table 83 lists serial mode receive timing characteristics.

Figure 97. UART RS-232 Serial Mode Receive Timing Diagram

Table 83. RS-232 Serial Mode Receive Timing Parameters

ID	Parameter	Symbol	Min.	Max.	Units
UA2	Receive Bit Time ¹	t_{Rbit}	$\frac{1}{F_{baud_rate}} - \frac{1}{16 \times F_{baud_rate}}$ ²	$\frac{1}{F_{baud_rate}} + \frac{1}{16 \times F_{baud_rate}}$	—

¹ The UART receiver can tolerate $1/(16 \times F_{baud_rate})$ tolerance in each bit. But accumulation tolerance in one frame must not exceed $3/(16 \times F_{baud_rate})$.

² F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is (ipg_perclk frequency) ÷ 16.

4.9.23.2 UART IrDA Mode Timing

The following subsections give the UART transmit and receive timings in IrDA mode.

4.9.23.2.13 UART IrDA Mode Transmitter

Figure 98 depicts the UART IrDA mode transmit timing, with 8 data bit/1 stop bit format. Table 84 lists the transmit timing characteristics.

Table 84. IrDA Mode Transmit Timing Parameters

ID	Parameter	Symbol	Min.	Max.	Units
UA3	Transmit bit time in IrDA mode	t_{TIRbit}	$\frac{1}{F_{baud_rate}} - \frac{1}{T_{ref_clk}}$ ¹	$\frac{1}{F_{baud_rate}} + T_{ref_clk}$	—
UA4	Transmit IR pulse duration	$t_{TIRpulse}$	$(3/16) \times (1/F_{baud_rate}) - T_{ref_clk}$	$(3/16) \times (1/F_{baud_rate}) + T_{ref_clk}$	—

¹ F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is (ipg_perclk frequency)/16.

² T_{ref_clk} : The period of UART reference clock ref_clk (ipg_perclk after RFDIV divider).

4.9.23.2.14 UART IrDA Mode Receiver

Figure 99 depicts the UART IrDA mode receive timing, with 8 data bit/1 stop bit format. Table 85 lists the receive timing characteristics.

Figure 99. UART IrDA Mode Receive Timing Diagram

Table 85. IrDA Mode Receive Timing Parameters

ID	Parameter	Symbol	Min.	Max.	Units
UA5	Receive bit time ¹ in IrDA mode	t_{RIRbit}	$\frac{1}{F_{baud_rate}} - \frac{1}{16 \times F_{baud_rate}}$ ²	$\frac{1}{F_{baud_rate}} + \frac{1}{16 \times F_{baud_rate}}$	—
UA6	Receive IR pulse duration	$t_{RIRpulse}$	1.41 μ s	$(5/16) \times (1/F_{baud_rate})$	—

¹ The UART receiver can tolerate $1/(16 \times F_{baud_rate})$ tolerance in each bit. But accumulation tolerance in one frame must not exceed $3/(16 \times F_{baud_rate})$.

² F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is (ipg_perclk frequency) \div 16.

4.9.24 USB Electrical Specifications

In order to support four different serial interfaces, the USB serial transceiver can be configured to operate in one of four modes:

- DAT_SE0 bidirectional, 3-wire mode
- DAT_SE0 unidirectional, 6-wire mode
- VP_VM bidirectional, 4-wire mode
- VP_VM unidirectional, 6-wire mode

4.9.24.1 DAT_SE0 Bidirectional Mode

5.2 MAPBGA Signal Assignments

Table 94 and Table 95 list MAPBGA signals, alphabetized by signal name, for silicon revisions 2.0 and 2.1, respectively. Table 96 and Table 97 show the signal assignment on the i.MX35 ball map for silicon revisions 2.0 and 2.1, respectively. The ball map for silicon revision 2.1 is different than the ballmap for silicon revision 2.0. The layout for each revision is not compatible, so it is important that the correct ballmap be used to implement the layout.

Table 98. i.MX35 Data Sheet Revision History

Revision Number	Date	Substantive Change(s)
10	06/2012	<ul style="list-style-type: none"> In Table 2, "Functional Differences in the i.MX35 Parts," on page 4, added two columns for part numbers MCIMX353 and MCIMX357. Added Table 29, "Clock Input Tolerance," on page 32 in Section 4.9.3, "DPLL Electrical Specifications." Updated Table 39, "DDR2 SDRAM Timing Parameter Table," on page 51 for DDR2-400 values. Updated Table 41, "DDR2 SDRAM Write Cycle Parameters," on page 53 for DDR2-400 values. Added Table 15, "AC Requirements of I/O Pins," on page 25. Updated WE4 parameter in Table 33, "WEIM Bus Timing Parameters," on page 38.
9	08/2010	<ul style="list-style-type: none"> Updated Table 32, "NFC Timing Parameters." Updated Table 33, "WEIM Bus Timing Parameters."
8	04/2010	<ul style="list-style-type: none"> Updated Table 1, "Ordering Information." Updated Table 14, "I/O Pin DC Electrical Characteristics."
6	10/21/2009	<ul style="list-style-type: none"> Added information for silicon rev. 2.1 Updated Table 1, "Ordering Information." Added Table 95, "Silicon Revision 2.1 Signal Ball Map Locations." Added Table 97, "Silicon Revision 2.1 Ball Map—17 x 17, 0.8 mm Pitch."
5	08/06/2009	<ul style="list-style-type: none"> Filled in TBDs in Table 14. Revised Figure 15 and Table 33 by removing FCE = 0 and FCE = 1. Added footnote 3 to the table. Added Table 26, "AC Electrical Characteristics of DDR Type IO Pins in SDRAM Mode Max Drive (1.8 V)."
4	04/30/2009	<p>Note: There were no revisions of this document between revision 1 and revision 4.</p> <ul style="list-style-type: none"> In Section 4.3.1, "Powering Up," reverse positions of steps 5 and 6. Updated values in Table 10, "i.MX35 Power Modes." Added Section 4.4, "Reset Timing." In Section 4.8.2, "AC Electrical Characteristics for DDR Pins (DDR2, Mobile DDR, and SDRAM Modes)," removed Slow Slew rate tables, relabeled Table 24, "AC Electrical Characteristics of DDR Type IO Pins in mDDR Mode," and Table 25, "AC Electrical Characteristics of DDR Type IO Pins in SDRAM Mode," to exclude mention of slew rate. In Section 4.9.5.2, "Wireless External Interface Module (WEIM)," modified Figure 16, "Synchronous Memory Timing Diagram for Read Access—WSC = 1," through Figure 21, "Muxed A/D Mode Timing Diagram for Synchronous Read Access—WSC = 7, LBA = 1, LBN = 1, LAH = 1, OEA = 7." In Section 4.9.6, "Enhanced Serial Audio Interface (ESAI) Timing Specifications," modified Figure 36, "ESAI Transmitter Timing," and Figure 37, "ESAI Receiver Timing," to remove extraneous signals. Removed a note from Figure 36, "ESAI Transmitter Timing."
1	12/2008	<ul style="list-style-type: none"> Updated Section 4.3.1, "Powering Up." Section 4.7, "Module-Level AC Electrical Specifications": Updated NFC, SDRAM and mDDR SDRAM timing. Inserted DDR2 SDRAM timing.
