Capacitance vs. Reverse Bias

Design Consideration

Because of the fast rise-time of the ESD transient, placement of ESD components is a key design consideration. To achieve optimal ESD suppression, the components should be placed on the circuit board as close to the source of the ESD transient as possible. Install the ESD suppressors directly behind the connector so that they are the first board-level circuit component encountered by the ESD transient. They are connected from signal/data line to ground.
