

- Timer
  - 16 Periodic Interrupt Timers (PITs)
  - Three System Timer Module (STM)
  - Four Software WatchDog Timers (SWT)
  - 96 Configurable Enhanced Modular Input Output Subsystem (eMIOS) channels
- Device/board boundary Scan testing supported with per Joint Test Action Group (JTAG) of IEEE (IEEE 1149.1) and 1149.7 (cJTAG)
- Security
  - Hardware Security Module (HSMv2)
  - Password and Device Security (PASS and TDM) supporting advanced censorship and life-cycle management
  - One Fault Collection and Control Unit (FCCU) to collect faults and issue interrupts
- Functional Safety
  - ISO26262 ASIL compliance
- Multiple operating modes
  - Includes enhanced low power operation

| 6.1   | Analog.....                                                      | 28 | 6.5.3   | WKPU/NMI timing.....                                              | 64 |
| 6.1.1 | ADC electrical specifications.....                               | 28 | 6.5.4   | External interrupt timing (IRQ pin).....                          | 65 |
| 6.1.2 | Analog Comparator (CMP) electrical specifications .....          | 32 | 7       | Thermal attributes.....                                           | 65 |
| 6.2   | Clocks and PLL interfaces modules.....                           | 33 | 7.1     | Thermal attributes.....                                           | 65 |
| 6.2.1 | Main oscillator electrical characteristics.....                  | 33 | 8       | Dimensions.....                                                   | 67 |
| 6.2.2 | 32 kHz Oscillator electrical specifications .....                | 35 | 8.1     | Obtaining package dimensions .....                                | 67 |
| 6.2.3 | 16 MHz RC Oscillator electrical specifications.....              | 35 | 9       | Pinouts.....                                                      | 68 |
| 6.2.4 | 128 KHz Internal RC oscillator Electrical specifications .....   | 36 | 9.1     | Package pinouts and signal descriptions.....                      | 68 |
| 6.2.5 | PLL electrical specifications .....                              | 36 | 10      | Reset sequence.....                                               | 68 |
| 6.3   | Memory interfaces.....                                           | 37 | 10.1    | Reset sequence duration.....                                      | 68 |
| 6.3.1 | Flash memory program and erase specifications.....               | 37 | 10.2    | BAF execution duration.....                                       | 68 |
| 6.3.2 | Flash memory Array Integrity and Margin Read specifications..... | 38 | 10.3    | Reset sequence description.....                                   | 69 |
| 6.3.3 | Flash memory module life specifications.....                     | 39 | 11      | Revision History.....                                             | 71 |
| 6.3.4 | Data retention vs program/erase cycles.....                      | 39 |         |                                                                   |    |

# 1 Block diagram

Figure 1. MPC5748G block diagram

## 2 Family comparison

The following table provides a summary of the different members of the MPC5748G family and their proposed features. This information is intended to provide an understanding of the range of functionality offered by this family. For full details of all of the family derivatives please contact your marketing representative.

**NOTE**

All optional features (Flash memory, RAM, Peripherals) start with lowest peripheral number (for example: STM\_0) or memory address and end at the highest available peripheral number or memory address (for example: MPC574xC have 2 STM, ending with STM\_1).

**Table 1. MPC5748G Family Comparison<sup>1</sup>**

| Feature                                  | MPC5747C                           | MPC5748C    | MPC5746G                           | MPC5747G    | MPC5748G    |
|------------------------------------------|------------------------------------|-------------|------------------------------------|-------------|-------------|
| CPUs                                     | e200z4                             | e200z4      | e200z4                             | e200z4      | e200z4      |
|                                          | e200z2                             | e200z2      | e200z4                             | e200z4      | e200z4      |
|                                          |                                    |             | e200z2                             | e200z2      | e200z2      |
| FPU                                      | e200z4                             | e200z4      | e200z4                             | e200z4      | e200z4      |

1. Feature set dependent on selected peripheral multiplexing, table shows example. Peripheral availability is package dependent.
2. Based on 125°C ambient operating temperature and subject to full device characterisation.
3. Additional SWT included when HSM option selected

4. Refer device datasheet and reference manual for information on to timer channel configuration and functions.

## 3 Ordering parts

### 3.1 Determining valid orderable parts

To determine the orderable part numbers for this device, go to [www.nxp.com](http://www.nxp.com) and perform a part number search for the following device number: MPC5748G .

### 3.2 Ordering Information

## 4 General

### 4.1 Absolute maximum ratings

#### NOTE

Functional operating conditions appear in the DC electrical characteristics. Absolute maximum ratings are stress ratings only, and functional operation at the maximum values is not guaranteed. See footnotes in [Table 5](#) for specific conditions

Stress beyond the listed maximum values may affect device reliability or cause permanent damage to the device.

**Table 5. Absolute maximum ratings**

| Symbol                                                              | Parameter                                                                          | Conditions <sup>1</sup>                                                  | Min         | Max                                                                              | Unit |

1. All voltages are referred to  $V_{SS\_HV}$  unless otherwise specified

2.  $V_{DD\_HV\_B}$  and  $V_{DD\_HV\_C}$  are common together on the 176 LQFP-EP package.

3. VDD\_HV\_FLA must be connected to VDD\_HV\_A when VDD\_HV\_A = 3.3V
4. VDD\_HV\_FLA must be disconnected from ANY power sources when VDD\_HV\_A = 5V
5. This pin should be decoupled with low ESR 1  $\mu$ F capacitor.
6. Not available for input voltage, only for decoupling internal regulators
7. 10-bit ADC does not have dedicated reference and its reference is double bonded to 10-bit ADC supply(VDD\_HV\_ADC0).
8. Allowed 1.45 – 1.5 V for 60 seconds cumulative time at maximum  $T_J = 150\text{ }^{\circ}\text{C}$ , remaining time as defined in footnotes 10 and 11.
9. Allowed 1.38 – 1.45 V– for 10 hours cumulative time at maximum  $T_J = 150\text{ }^{\circ}\text{C}$ , remaining time as defined in footnote 11.
10. 1.32 – 1.38 V range allowed periodically for supply with sinusoidal shape and average supply value below 1.326 V at maximum  $T_J = 150\text{ }^{\circ}\text{C}$ .
11. If HVD on core supply ( $V_{HVD\_LV\_x}$ ) is enabled, it will generate a reset when supply goes above threshold.
12.  $T_J = 150\text{ }^{\circ}\text{C}$ . Assumes  $T_A = 125\text{ }^{\circ}\text{C}$ 
  - Assumes maximum  $\theta_{JA}$ . See [Thermal attributes](#)

## 4.2 Recommended operating conditions

The following table describes the operating conditions for the device, and for which all specifications in the data sheet are valid, except where explicitly noted. The device operating conditions must not be exceeded in order to guarantee proper operation and reliability. The ranges in this table are design targets and actual data may vary in the given range.

### NOTE

- For normal device operations, all supplies must be within operating range corresponding to the range mentioned in following tables. This is required even if some of the features are not used.
- If VDD\_HV\_A is in 5.0V range, VDD\_HV\_FLA should be externally supplied using a 3.3V source. If VDD\_HV\_A is in 3.3V range, VDD\_HV\_FLA should be shorted to VDD\_HV\_A.
- VDD\_HV\_A, VDD\_HV\_B and VDD\_HV\_C are all independent supplies and can each be set to 3.3V or 5V. The following tables: 'Recommended operating conditions (VDD\_HV\_x = 3.3 V)' and table 'Recommended operating conditions (VDD\_HV\_x = 5 V)' specify their ranges when configured in 3.3V or 5V respectively.

**Table 6. Recommended operating conditions ( $V_{DD\_HV\_x} = 3.3\text{ V}$ )**

| Symbol                           | Parameter               | Conditions <sup>1</sup> | Min <sup>2</sup> | Max | Unit |
|----------------------------------|-------------------------|-------------------------|------------------|-----|------|
| VDD_HV_A<br>VDD_HV_B<br>VDD_HV_C | HV IO supply voltage    | —                       | 3.15             | 3.6 | V    |
| VDD_HV_FLA <sup>3</sup>          | HV flash supply voltage | —                       | 3.15             | 3.6 | V    |

| $V_{IN1\_CMP\_REF}$ <sup>5, 6</sup>      | Analog Comparator DAC reference voltage                     | —                             | 3.15                                                          | 3.6  | V    |
| $I_{INJPAD}$                             | Injected input current on any pin during overload condition | —                             | -3.0                                                          | 3.0  | mA   |
| $T_A$                                    | Ambient temperature under bias                              | $f_{CPU} \leq 160\text{ MHz}$ | -40                                                           | 125  | °C   |
| $T_J$                                    | Junction temperature under bias                             | —                             | -40                                                           | 150  | °C   |

1. All voltages are referred to  $V_{SS\_HV}$  unless otherwise specified
2. Device will be functional down (and electrical specifications as per various datasheet parameters will be guaranteed) to the point where one of the LVD/HVD resets the device. When voltage drops outside range for an LVD/HVD, device is reset.
3.  $V_{DD\_HV\_FLA}$  must be connected to  $V_{DD\_HV\_A}$  when  $V_{DD\_HV\_A} = 3.3\text{ V}$
4.  $V_{DD\_LV}$  supply pins should never be grounded (through a small impedance). If these are not driven, they should only be left floating.
5.  $V_{IN1\_CMP\_REF} \leq V_{DD\_HV\_A}$
6. This supply is shorted  $V_{DD\_HV\_A}$  on lower packages.

**NOTE**

If  $V_{DD\_HV\_A}$  is in 5V range, it is necessary to use internal Flash supply 3.3V regulator.  $V_{DD\_HV\_FLA}$  should not be supplied externally and should only have decoupling capacitor.

| $I_{INJPAD}$                     | Injected input current on any pin during overload condition | —                             | -3.0             | 3.0 | mA   |
| $T_A$                            | Ambient temperature under bias                              | $f_{CPU} \leq 160\text{ MHz}$ | -40              | 125 | °C   |
| $T_J$                            | Junction temperature under bias                             | —                             | -40              | 150 | °C   |

1. All voltages are referred to  $V_{SS\_HV}$  unless otherwise specified
2. Device will be functional down (and electrical specifications as per various datasheet parameters will be guaranteed) to the point where one of the LVD/HVD resets the device. When voltage drops outside range for an LVD/HVD, device is reset.
3. When  $V_{DD\_HV}$  is in 5 V range,  $V_{DD\_HV\_FLA}$  cannot be supplied externally. This pin is decoupled with  $C_{flash\_reg}$ .
4.  $V_{DD\_LV}$  supply pins should never be grounded (through a small impedance). If these are not driven, they should only be left floating
5. This supply is shorted  $V_{DD\_HV\_A}$  on lower packages.

### 4.3 Voltage regulator electrical characteristics

The voltage regulator is composed of the following blocks:

- Choice of generating supply voltage for the core area.
  - Control of external NPN ballast transistor
  - Connecting an external 1.25 V (nominal) supply directly without the NPN ballast
- Internal generation of the 3.3 V flash supply when device connected in 5V applications
- External bypass of the 3.3 V flash regulator when device connected in 3.3V applications
- Low voltage detector - low threshold (LVD\_IO\_A\_LO) for  $V_{DD\_HV\_IO\_A}$  supply
- Low voltage detector - high threshold (LVD\_IO\_A\_Hi) for  $V_{DD\_HV\_IO\_A}$  supply
- Various low voltage detectors (LVD\_LV\_x)
- High voltage detector (HVD\_LV\_cold) for 1.2 V digital core supply ( $V_{DD\_LV}$ )
- Power on Reset (POR\_LV) for 1.25 V digital core supply ( $V_{DD\_LV}$ )
- Power on Reset (POR\_HV) for 3.3 V to 5 V supply ( $V_{DD\_HV\_A}$ )

The following bipolar transistors<sup>1</sup> are supported, depending on the device performance requirements. As a minimum the following must be considered when determining the most appropriate solution to maintain the device under its maximum power dissipation capability: current, ambient temperature, mounting pad area, duty cycle and frequency for  $I_{dd}$ , collector voltage, etc

1. BCP56, MCP68 and MJD31 are guaranteed ballasts.

| $R_{C\_BALLAST}$                   | Series resistor on collector of FPREG ballast       | When VDD_HV_BALLAST is shorted to VDD_HV_A on the board                                                                                                                                            | —    | —   | 0.1 | Ohm     |
| $t_{SU}$                           | Start-up time after main supply stabilization       | $C_{fp\_reg} = 3 \mu F$                                                                                                                                                                            | —    | 74  | —   | $\mu s$ |
| $t_{ramp}$                         | Load current transient                              | $I_{load}$ from 15% to 55%<br>$C_{fp\_reg} = 3 \mu F$                                                                                                                                              |      | 1.0 |     | $\mu s$ |

- Split capacitance on each pair VDD\_LV pin should sum up to a total value of  $C_{fp\_reg}$
- Typical values will vary over temperature, voltage, tolerance, drift, but total variation must not exceed minimum and maximum values.
- Ceramic X7R or X5R type with capacitance-temperature characteristics +/-15% of -55 degC to +125degC is recommended. The tolerance +/-20% is acceptable.
- It is required to minimize the board parasitic inductance from decoupling capacitor to VDD\_HV\_FL A pin and the routing inductance should be less than 1nH.
- For VDD\_HV\_A, VDD\_HV\_B, and VDD\_HV\_C, 1 $\mu F$  on each side of the chip
    - 0.1  $\mu F$  close to each VDD/VSS pin pair.
    - 10  $\mu F$  near for each power supply source
    - For VDD\_LV, 0.1 $\mu F$  close to each VDD/VSS pin pair is required. Depending on the the selected regulation mode, this amount of capacitance will need to be subtracted from the total capacitance required by the regulator for e.g., as specified by CFP\_REG parameter.
  - For VDD\_LV, 0.1 $\mu F$  close to each VDD/VSS pin pair is required. Depending on the the selected regulation mode, this amount of capacitance will need to be subtracted from the total capacitance required by the regulator for e.g., as specified by CFP\_REG parameter
- Only applicable to ADC1

7. In external ballast configuration the following must be ensured during power-up and power-down (Note: If  $V_{DD\_HV\_BALLAST}$  is supplied from the same source as  $V_{DD\_HV\_A}$  this condition is implicitly met):
- During power-up,  $V_{DD\_HV\_BALLAST}$  must have met the min spec of 2.25V before  $V_{DD\_HV\_A}$  reaches the  $POR\_HV\_RISE$  min of 2.75V.
  - During power-down,  $V_{DD\_HV\_BALLAST}$  must not drop below the min spec of 2.25V until  $V_{DD\_HV\_A}$  is below  $POR\_HV\_FALL$  min of 2.7V.

## NOTE

For a typical configuration using an external ballast transistor with separate supply for  $V_{DD\_HV\_A}$  and the ballast collector, a bulk storage capacitor (as defined in [Table 8](#)) is required on  $V_{DD\_HV\_A}$  close to the device pins to ensure a stable supply voltage.

Extra care must be taken if the  $V_{DD\_HV\_A}$  supply is also being used to power the external ballast transistor or the device is running in internal regulation mode. In these modes, the inrush current on device Power Up or on exit from Low Power Modes is significant and may cause the  $V_{DD\_HV\_A}$  voltage to drop resulting in an LVD reset event. To avoid this, the board layout should be optimized to reduce common trace resistance or additional capacitance at the ballast transistor collector (or  $V_{DD\_HV\_A}$  pins in the case of internal regulation mode) is required. NXP recommends that customers simulate the external voltage supply circuitry.

In all circumstances, the voltage on  $V_{DD\_HV\_A}$  must be maintained within the specified operating range (see [Recommended operating conditions](#)) to prevent LVD events.

## 4.4 Voltage monitor electrical characteristics

**Table 9. Voltage monitor electrical characteristics**

1. All monitors that are active at power-up will gate the power up recovery and prevent exit from POWERUP phase until the minimum level is crossed. These monitors can in some cases be masked during normal device operation, but when active will always generate a POR reset.
2. There is no voltage monitoring on the V<sub>DD\_HV\_ADC0</sub>, V<sub>DD\_HV\_ADC1</sub>, V<sub>DD\_HV\_B</sub> and V<sub>DD\_HV\_C</sub> I/O segments. For applications requiring monitoring of these segments, either connect these to V<sub>DD\_HV\_A</sub> at the PCB level or monitor externally.

## 4.5 Supply current characteristics

Current consumption data is given in the following table. These specifications are design targets and are subject to change per device characterization.

### NOTE

The ballast must be chosen in accordance with the ballast transistor supplier operating conditions and recommendations.

**Table 10. Current consumption characteristics**

| Symbol                         | Parameter                                     | Conditions <sup>1</sup>                                                                                                                                          | Min | Typ | Max | Unit |

1. The content of the Conditions column identifies the components that draw the specific current.
2. ALL Modules enabled at maximum frequency: 2 x e200Z4 @160 MHz, e200Z2 at 80 MHz, Platform @160MHz, DMA (SRAM to SRAM), all SRAMs accessed in parallel, Flash access(prefetch is disabled while buffers are enabled), HSM reading from flash at regular intervals (500 pll clock cycles), ENET0 transmitting, MLB transmitting, FlexRay transmitting, USB-SPH transmitting (USB-OTG only clocked), 2 x I2C transmitting (rest clocked), 1 x SAI transmitting (rest clocked), ADC0 converting using BCTU triggers triggered through PIT (other ADC clocked), RTC running, 3 x STM running, 2 x DSPI transmitting (rest clocked), 2 x SPI transmitting (rest clocked), 4 x CAN state machines working(rest clocked), 9 x LINFlexD transmitting (rest clocked), 1 x eMIOS clocked (used OPWFMB mode) (Others clock gated), SDHC, 3 x CMP only clocked, FIRC, SIRC, FXOSC, SXOSC, PLL running. All others modules clock gated if not specifically mentioned. I/O supply current excluded.
3. Recommended Transistors:MJD31 @ 85°C, 105°C and 125°C.
4. T<sub>j</sub>=150°C. Assumes T<sub>a</sub>=125°C
  - Assumes maximum θJA. See [Thermal attributes](#)
5. Enabled Modules in Gateway mode: 2 x e200Z4 @160 MHz (Instruction and Data cache enabled), Platform @160MHz, e200Z2 at 80 MHz(Instruction cache enabled), all SRAMs accessed in parallel, Flash access(prefetch is disabled while buffers are enabled), HSM reading from flash at regular intervals(500 pll clock cycles), ENET0 transmitting, MLB transmitting, FlexRay transmitting, USB-SPH Transmitting, USB-OTG clocked, 2 x I2C transmitting, (2 x I2C clock gated), 1 x SAI transmitting (2 x SAI clock gated), ADC0 converting in continuous mode (ADC1 clock gated), PIT clocked, RTC clocked, 3 x STM clocked, 2 x DSPI transmitting(Other DSPS clock gated), 2 x SPI transmitting(Other SPIs clock gated), 4

## General

- x FlexCAN state machines clocked (other FLEXCAN clock gated), 4 x LINFlexD transmitting (Other clock gated), 1x eMIOS clocked (used OPWFMB mode) (Others clock gated), FIRC, SIRC, FXOSC, SXOSC, PLL running, BCTU, DMAMUX, ACOMP clock gated. All others modules clock gated if not specifically mentioned. I/O supply current excluded
6. Recommended Transistors: MJD31 @ 85°C, 105°C and 125°C.
  7. Enabled Modules in Body mode enabled at maximum frequency: 2 x e200Z4 @ 120Mhz (Instruction and Data cache enabled), Platform @ 120MHz, SRAMs accessed in parallel, Flash access (prefetch is disabled while buffers are enabled), HSM reading from flash at regular intervals (500 pll clock cycles), DMA (SRAM to SRAM), ADC0 converting using BCTU triggers which are triggered through PIT (ADC1 clocked), RTC clocked, 3 x STM clocked, 2 x DSPI transmitting (others DSPIs clocked), 2 x SPI transmitting (others clocked), 4 x FlexCAN state machines working (others clocked), 9x LINFlexD transmitting (others clocked), 1x eMIOS operational (used OPWFMB mode) (others clocked), FIRC, SIRC, FXOSC, SXOSC, PLL running, MEMU, FCCU, SIUL, SDHC, CMP clocked, e200Z2, ENET, MLB, SAI, I2C, FlexRay, USB clock gated. All others modules clock gated if not specifically mentioned I/O supply current excluded
  8. Recommended Transistors: BCP56, BCP68 or MJD31 @ 85°C, BCP56, BCP68 or MJD31 @ 105°C and MJD31 @ 125°C.
  9. Enabled Modules in Body mode enabled at maximum frequency: 2 x e200Z4 @ 80Mhz (Instruction and Data cache enabled), Platform @ 80MHz, SRAMs accessed in parallel, Flash access (prefetch is disabled while buffers are enabled), HSM reading from flash at regular intervals (500 pll clock cycles), DMA (SRAM to SRAM), ADC0 converting using BCTU triggers which are triggered through PIT (ADC1 clocked), RTC clocked, 3 x STM clocked, 2 x DSPI transmitting (others DSPIs clocked), 2 x SPI transmitting (others clocked), 4 x FlexCAN state machines working (others clocked), 9x LINFlexD transmitting (others clocked), 1x eMIOS operational (used OPWFMB mode) (others clocked), FIRC, SIRC, FXOSC, SXOSC, PLL running, MEMU, FCCU, SIUL, SDHC, CMP clocked, e200Z2, ENET, MLB, SAI, I2C, FlexRay, USB clock gated. All others modules clock gated if not specifically mentioned I/O supply current excluded
  10. Recommended Transistors: BCP56, BCP68 or MJD31 @ 85°C, 105°C and 125°C
  11. Internal structures hold the input voltage less than  $V_{DD\_HV\_ADC\_REF} + 1.0$  V on all pads powered by  $V_{DDA}$  supplies, if the maximum injection current specification is met (3 mA for all pins) and  $V_{DDA}$  is within the operating voltage specifications.
  12. This value is the total current for two ADCs. Each ADC might consume up to 2mA at max.

**Table 11. Low Power Unit (LPU) Current consumption characteristics**

1. The content of the Conditions column identifies the components that draw the specific current.

### NOTE

For the Precision channel Analog inputs, SIUL2\_MSCRn[PUS] must be configured to 0 before entering STANDBY. An increase in current would be observed when SIUL2\_MSCRn[PUS] is configured to be 1, irrespective of the state of IBE or PUE. The current numbers would increase irrespective of whether the pad is pulled low/high externally.

## 4.6 Electrostatic discharge (ESD) characteristics

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts  $\times$  ( $n + 1$ ) supply pin). This test conforms to the AEC-Q100-002/-003/-011 standard.

### NOTE

A device will be defined as a failure if after exposure to ESD pulses the device no longer meets the device specification requirements. Complete DC parametric and functional testing shall be performed per applicable device specification at room

temperature followed by hot temperature, unless specified otherwise in the device specification.

**Table 13. ESD ratings**

| Symbol         | Parameter                                         | Conditions <sup>1</sup>                                          | Class | Max value <sup>2</sup> | Unit |

1. As measured from 50% of core side input to Voh/Vol of the output
2. This row specifies the min and max asymmetry between both the prop delay and the edge rates for a given PVT and 25pF load. Required for the Flexray spec.
3. Slew rate control modes
4. Input slope = 2ns

**NOTE**

The specification given above is based on simulation data into an ideal lumped capacitor. Customer should use IBIS models for their specific board/loading conditions to simulate the expected signal integrity and edge rates of their system.

**NOTE**

The specification given above is measured between 20% / 80%.

**Table 16. Functional Pad AC Specifications @ 5 V Range (continued)**

| Symbol                                | Prop. Delay (ns) <sup>1</sup><br>L>H/H>L |         | Rise/Fall Edge (ns) |         | Drive Load (pF) | SIUL2_MSCRn[SRC 1:0] |
|---------------------------------------|------------------------------------------|---------|---------------------|---------|-----------------|----------------------|
|                                       | Min                                      | Max     | Min                 | Max     |                 | MSB,LSB              |
|                                       |                                          | 65/65   |                     | 40/40   | 200             |                      |
| pad_i_hv/<br>pad_sr_hv<br><br>(input) |                                          | 1.5/1.5 |                     | 0.5/0.5 | 0.5             | NA                   |

1. As measured from 50% of core side input to Voh/Vol of the output

2. Slew rate control modes

### NOTE

The above specification is based on simulation data into an ideal lumped capacitor. Customer should use IBIS models for their specific board/loading conditions to simulate the expected signal integrity and edge rates of their system.

### NOTE

The above specification is measured between 20% / 80%.

## 5.4 DC electrical specifications @ 5 V Range

**Table 17. DC electrical specifications @ 5 V Range**

| Symbol          | Parameter                                                 | Value           |                | Unit |
|-----------------|-----------------------------------------------------------|-----------------|----------------|------|
|                 |                                                           | Min             | Max            |      |
| VDD_LV          | LV (core) Supply Voltage                                  | 1.08            | 1.32           | V    |
| VDD_HV_x        | I/O Supply Voltage                                        | 4.5             | 5.5            | V    |
| Vih (pad_i_hv)  | pad_i_hv Input Buffer High Voltage                        | 0.7*VDD_HV_x    | VDD_HV_x + 0.3 | V    |
| Vil (pad_i_hv)  | pad_i_hv Input Buffer Low Voltage                         | VSS_LV - 0.3    | 0.45*VDD_HV_x  | V    |
| Vhys (pad_i_hv) | pad_i_hv Input Buffer Hysteresis                          | 0.09*VDD_HV_x   |                | V    |
| Vih             | CMOS Input Buffer High Voltage (with hysteresis disabled) | 0.55 * VDD_HV_x | VDD_HV_x + 0.3 | V    |
| Vil             | CMOS Input Buffer Low Voltage (with hysteresis disabled)  | VSS_LV - 0.3    | 0.4 * VDD_HV_x | V    |
| Vhys            | CMOS Input Buffer Hysteresis                              | 0.09 * VDD_HV_x |                | V    |
| Vih_hys         | CMOS Input Buffer High Voltage (with hysteresis enabled)  | 0.65* VDD_HV_x  | VDD_HV_x + 0.3 | V    |

Table continues on the next page...

## 6 Peripheral operating requirements and behaviours

### 6.1 Analog

#### 6.1.1 ADC electrical specifications

The device provides a 12-bit Successive Approximation Register (SAR) Analog-to-Digital Converter.

**Figure 5. ADC characteristics and error definitions**

### 6.1.1.1 Input equivalent circuit and ADC conversion characteristics

**Figure 6. Input equivalent circuit**

#### NOTE

The ADC performance specifications are not guaranteed if two ADCs simultaneously sample the same shared channel.

**Table 20. ADC conversion characteristics (for 12-bit)**

| Symbol                 | Parameter                                                                                                   | Conditions                        | Min              | Typ <sup>1</sup> | Max  | Unit       |
|------------------------|-------------------------------------------------------------------------------------------------------------|-----------------------------------|------------------|------------------|------|------------|
| $f_{CK}$               | ADC Clock frequency (depends on ADC configuration) (The duty cycle depends on AD_CK <sup>2</sup> frequency) | —                                 | 15.2             | 80               | 80   | MHz        |
| $f_s$                  | Sampling frequency                                                                                          | 80 MHz                            | —                | —                | 1.00 | MHz        |
| $t_{sample}$           | Sample time <sup>3</sup>                                                                                    | 80 MHz @ 100 ohm source impedance | 250              | —                | —    | ns         |
| $t_{conv}$             | Conversion time <sup>4</sup>                                                                                | 80 MHz                            | 700              | —                | —    | ns         |
| $t_{total\_conv}$      | Total Conversion time $t_{sample} + t_{conv}$ (for standard and extended channels)                          | 80 MHz                            | 1.5 <sup>5</sup> | —                | —    | $\mu s$    |
|                        | Total Conversion time $t_{sample} + t_{conv}$ (for precision channels)                                      |                                   | 1                | —                | —    |            |
| $C_S$                  | ADC input sampling capacitance                                                                              | —                                 | —                | 3                | 5    | pF         |
| $C_{P1}$ <sup>6</sup>  | ADC input pin capacitance 1                                                                                 | —                                 | —                | —                | 5    | pF         |
| $C_{P2}$ <sup>6</sup>  | ADC input pin capacitance 2                                                                                 | —                                 | —                | —                | 0.8  | pF         |
| $R_{SW1}$ <sup>6</sup> | Internal resistance of analog source                                                                        | $V_{REF}$ range = 4.5 to 5.5 V    | —                | —                | 0.3  | k $\Omega$ |
|                        |                                                                                                             | $V_{REF}$ range = 3.15 to 3.6 V   | —                | —                | 875  | $\Omega$   |

Table continues on the next page...

**Table 20. ADC conversion characteristics (for 12-bit) (continued)**

| Symbol                                    | Parameter                                             | Conditions                          | Min | Typ <sup>1</sup> | Max  | Unit          |
|-------------------------------------------|-------------------------------------------------------|-------------------------------------|-----|------------------|------|---------------|
| $R_{AD}^6$                                | Internal resistance of analog source                  | —                                   | —   | —                | 825  | $\Omega$      |
| INL                                       | Integral non-linearity (precise channel)              | —                                   | –2  | —                | 2    | LSB           |
| INL                                       | Integral non-linearity (standard channel)             | —                                   | –3  | —                | 3    | LSB           |
| DNL                                       | Differential non-linearity                            | —                                   | –1  | —                | 1    | LSB           |
| OFS                                       | Offset error                                          | —                                   | –6  | —                | 6    | LSB           |
| GNE                                       | Gain error                                            | —                                   | –4  | —                | 4    | LSB           |
| ADC Analog Pad (pad going to one ADC)     | Max leakage (precision channel)                       | 150 °C                              | —   | —                | 250  | nA            |
|                                           | Max leakage (standard channel)                        | 150 °C                              | —   | —                | 2500 | nA            |
|                                           | Max leakage (standard channel)                        | 105 °C $T_A$                        | —   | 5                | 250  | nA            |
|                                           | Max positive/negative injection                       |                                     | –5  | —                | 5    | mA            |
| $TUE_{\text{precision channels}}$         | Total unadjusted error for precision channels         | Without current injection           | –6  | +/-4             | 6    | LSB           |
|                                           |                                                       | With current injection              |     | +/-5             |      | LSB           |
| $TUE_{\text{standard/extended channels}}$ | Total unadjusted error for standard/extended channels | Without current injection           | –8  | +/-6             | 8    | LSB           |
|                                           |                                                       | With current injection <sup>7</sup> |     | +/-8             |      | LSB           |
| $t_{\text{recovery}}$                     | STOP mode to Run mode recovery time                   |                                     |     |                  | < 1  | $\mu\text{s}$ |

- Active ADC input,  $V_{inA} < [\min(\text{ADC\_VrefH}, \text{ADC\_ADV}, \text{VDD\_HV\_IOx})]$ . VDD\_HV\_IOx refers to I/O segment supply voltage. Violation of this condition would lead to degradation of ADC performance. Please refer to Table: 'Absolute maximum ratings' to avoid damage. Refer to Table: 'Recommended operating conditions (VDD\_HV\_x = 3.3 V)' for required relation between IO\_supply\_A,B,C and ADC\_Supply.
- The internally generated clock (known as AD\_clk or ADCK) could be same as the peripheral clock or half of the peripheral clock based on register configuration in the ADC.
- During the sample time the input capacitance  $C_S$  can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within  $t_{\text{sample}}$ . After the end of the sample time  $t_{\text{sample}}$ , changes of the analog input voltage have no effect on the conversion result. Values for the sample clock  $t_{\text{sample}}$  depend on programming.
- This parameter does not include the sample time  $t_{\text{sample}}$ , but only the time for determining the digital result and the time to load the result register with the conversion result.
- Apart from  $t_{\text{sample}}$  and  $t_{\text{conv}}$ , few cycles are used up in ADC digital interface and hence the overall throughput from the ADC is lower.
- See [Figure 2](#).
- Current injection condition for ADC channels is defined for an inactive ADC channel (on which conversion is NOT being performed), and this occurs when voltage on the ADC pin exceeds the I/O supply or ground. However, absolute maximum voltage spec on pad input (VINA, see Table: Absolute maximum ratings) must be honored to meet TUE spec quoted here

**NOTE**

The ADC input pins sit across all three I/O segments, VDD\_HV\_A, VDD\_HV\_B and VDD\_HV\_C.

## 6.1.2 Analog Comparator (CMP) electrical specifications

Table 21. Comparator and 6-bit DAC electrical specifications

| Symbol      | Description                                                                                                                                                                                    | Min.     | Typ. | Max.                | Unit             |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|------|---------------------|------------------|
| $I_{DDHS}$  | Supply current, High-speed mode (EN=1, PMODE=1)                                                                                                                                                | —        | —    | 250                 | $\mu A$          |
| $I_{DDL S}$ | Supply current, low-speed mode (EN=1, PMODE=0)                                                                                                                                                 | —        | 5    | 11                  | $\mu A$          |
| $V_{AIN}$   | Analog input voltage                                                                                                                                                                           | $V_{SS}$ | —    | $V_{IN1\_CMP\_REF}$ | V                |
| $V_{AIO}$   | Analog input offset voltage <sup>1</sup>                                                                                                                                                       | -42      | —    | 42                  | mV               |
| $V_H$       | Analog comparator hysteresis <sup>2</sup> <ul style="list-style-type: none"> <li>CR0[HYSTCTR] = 00</li> <li>CR0[HYSTCTR] = 01</li> <li>CR0[HYSTCTR] = 10</li> <li>CR0[HYSTCTR] = 11</li> </ul> | —        | 1    | 25                  | mV               |
|             |                                                                                                                                                                                                | —        | 20   | 50                  | mV               |

| DNL         | 6-bit DAC differential non-linearity                                                                                                                                                           | -0.8     | —    | 0.8                 | LSB              |

1. Measured with hysteresis mode of 00

2. Typical hysteresis is measured with input voltage range limited to 0.6 to  $V_{DD\_HV\_A}-0.6V$

3. Full swing =  $V_{IH}$ ,  $V_{IL}$

4. Comparator initialization delay is defined as the time between software writes to change control inputs (Writes to DACEN, VRSEL, PSEL, MSEL, VOSEL) and the comparator output settling to a stable level.

5. 1 LSB =  $V_{reference}/64$

## 6.2 Clocks and PLL interfaces modules

### 6.2.1 Main oscillator electrical characteristics

This device provides a driver for oscillator in pierce configuration with amplitude control. Controlling the amplitude allows a more sinusoidal oscillation, reducing in this way the EMI. Other benefits arises by reducing the power consumption. This Loop Controlled Pierce (LCP mode) requires good practices to reduce the stray capacitance of traces between crystal and MCU.

An operation in Full Swing Pierce (FSP mode), implemented by an inverter is also available in case of parasitic capacitances and cannot be reduced by using crystal with high equivalent series resistance. For this mode, a special care needs to be taken regarding the serial resistance used to avoid the crystal overdrive.

Other two modes called External (EXT Wave) and disable (OFF mode) are provided. For EXT Wave, the drive is disabled and an external source of clock within CMOS level based in analog oscillator supply can be used. When OFF, EXTAL is pulled down by 240 Kohms resistor and the feedback resistor remains active connecting XTAL through EXTAL by 1M resistor.

Figure 7. Oscillator connections scheme

Table 22. Main oscillator electrical characteristics

| Symbol                | Parameter                                | Mode    | Conditions | Min | Typ | Max | Unit            |
|-----------------------|------------------------------------------|---------|------------|-----|-----|-----|-----------------|
| f <sub>XOSCHS</sub>   | Oscillator frequency                     | FSP/LCP |            | 8   |     | 40  | MHz             |
| g <sub>mXOSCHS</sub>  | Driver Transconductance                  | LCP     |            |     | 23  |     | mA/V            |
|                       |                                          | FSP     |            |     | 33  |     |                 |

|                       |                                          |         | 16 MHz     |     | 2.2 |     |                 |
|                       |                                          |         | 40 MHz     |     | 3.2 |     |                 |

Table continues on the next page...

**Table 22. Main oscillator electrical characteristics (continued)**

| Symbol          | Parameter                             | Mode     | Conditions            | Min  | Typ | Max  | Unit |
|-----------------|---------------------------------------|----------|-----------------------|------|-----|------|------|
|                 |                                       | LCP      | 8 MHz                 |      | 141 |      | uA   |
|                 |                                       |          | 16 MHz                |      | 252 |      |      |
|                 |                                       |          | 40 MHz                |      | 518 |      |      |
| V <sub>IH</sub> | Input High level CMOS Schmitt trigger | EXT Wave | Oscillator supply=3.3 | 1.95 |     |      | V    |
| V <sub>IL</sub> | Input low level CMOS Schmitt trigger  | EXT Wave | Oscillator supply=3.3 |      |     | 1.25 | V    |

## 6.2.2 32 kHz Oscillator electrical specifications

**Table 23. 32 kHz oscillator electrical specifications**

| Symbol              | Parameter                                 | Condition | Min | Typ | Max | Unit |
|---------------------|-------------------------------------------|-----------|-----|-----|-----|------|
| f <sub>osc_lo</sub> | Oscillator crystal or resonator frequency |           | 32  |     | 40  | KHz  |
| t <sub>cst</sub>    | Crystal Start-up Time <sup>1, 2</sup>     |           |     |     | 2   | s    |

1. This parameter is characterized before qualification rather than 100% tested.
2. Proper PC board layout procedures must be followed to achieve specifications.

## 6.2.3 16 MHz RC Oscillator electrical specifications

**Table 24. 16 MHz RC Oscillator electrical specifications**

| Symbol               | Parameter                              | Conditions | Value |     |     | Unit |
|----------------------|----------------------------------------|------------|-------|-----|-----|------|
|                      |                                        |            | Min   | Typ | Max |      |
| F <sub>Target</sub>  | IRC target frequency                   | —          | —     | 16  | —   | MHz  |
| PTA                  | IRC frequency variation after trimming | —          | -5    | —   | 5   | %    |
| T <sub>startup</sub> | Startup time                           | —          |       | —   | 1.5 | us   |
| T <sub>STJIT</sub>   | Cycle to cycle jitter                  |            | —     | —   | 1.5 | %    |
| T <sub>LTJIT</sub>   | Long term jitter                       |            | —     | —   | 0.2 | %    |

### NOTE

The above start up time of 1 us is equivalent to 16 cycles of 16 MHz.

## 6.2.4 128 KHz Internal RC oscillator Electrical specifications

Table 25. 128 KHz Internal RC oscillator electrical specifications

| Symbol     | Parameter              | Condition     | Min | Typ | Max   | Unit    |
|------------|------------------------|---------------|-----|-----|-------|---------|
| $F_{osc1}$ | Oscillator frequency   | Calibrated    | 119 | 128 | 136.5 | KHz     |
|            | Temperature dependence |               |     |     | 600   | ppm/C   |
|            | Supply dependence      |               |     |     | 18    | %/V     |
|            | Supply current         | Clock running |     |     | 2.75  | $\mu$ A |
|            |                        | Clock stopped |     |     | 200   | nA      |

1.  $V_{dd}=1.2$  V, 1.32V,  $T_a=-40$  C, 125 C

## 6.2.5 PLL electrical specifications

Table 26. PLL electrical specifications

| Parameter                        | Min       | Typ | Max          | Unit    | Comments                                                    |
|----------------------------------|-----------|-----|--------------|---------|-------------------------------------------------------------|
| Input Frequency                  | 8         |     | 40           | MHz     |                                                             |
| VCO Frequency Range              | 600       |     | 1280         | MHz     |                                                             |
| Duty Cycle at pllclkout          | 48%       |     | 52%          |         | This specification is guaranteed at PLL IP boundary         |
| Period Jitter                    |           |     | See Table 27 | ps      | NON SSCG mode                                               |
| TIE                              |           |     | See Table 27 |         | at 960 M Integrated over 1MHz offset not valid in SSCG mode |
| Modulation Depth (Center Spread) | +/- 0.25% |     | +/- 3.0%     |         |                                                             |
| Modulation Frequency             |           |     | 32           | KHz     |                                                             |
| Lock Time                        |           |     | 60           | $\mu$ s | Calibration mode                                            |

Table 27. Jitter calculation

| Type of jitter                     | Jitter due to Supply Noise (ps) $J_{SN}^1$ | Jitter due to Fractional Mode (ps) $J_{SDM}^2$ | Jitter due to Fractional Mode $J_{SSCG}$ (ps) $^3$ | 1 Sigma Random Jitter $J_{RJ}$ (ps) $^4$ | Total Period Jitter (ps)                             |
|------------------------------------|--------------------------------------------|------------------------------------------------|----------------------------------------------------|------------------------------------------|------------------------------------------------------|
| Period Jitter                      | 60 ps                                      | 3% of pllclkout1,2                             | Modulation depth                                   | 0.1% of pllclkout1,2                     | $\pm(J_{SN}+J_{SDM}+J_{SSCG}+N^{[4]} \times J_{RJ})$ |
| Long Term Jitter (Integer Mode)    |                                            |                                                |                                                    | 40                                       | $\pm(N \times J_{RJ})$                               |
| Long Term jitter (Fractional Mode) |                                            |                                                |                                                    | 100                                      | $\pm(N \times J_{RJ})$                               |

1. This jitter component is due to self noise generated due to bond wire inductances on different PLL supplies. The jitter value is valid for inductor value of 5nH or less each on VDD\_LV and VSS\_LV.

2. This jitter component is added when the PLL is working in the fractional mode.
3. This jitter component is added when the PLL is working in the Spread Spectrum Mode. Else it is 0.
4. The value of N is dependent on the accuracy requirement of the application. See [Percentage of sample exceeding specified value of jitter table](#)

**Table 28. Percentage of sample exceeding specified value of jitter**

| N | Percentage of samples exceeding specified value of jitter (%) |
|---|---------------------------------------------------------------|
| 1 | 31.73                                                         |
| 2 | 4.55                                                          |
| 3 | 0.27                                                          |
| 4 | $6.30 \times 10^{-3}$                                         |
| 5 | $5.63 \times 10^{-5}$                                         |
| 6 | $2.00 \times 10^{-7}$                                         |
| 7 | $2.82 \times 10^{-10}$                                        |

## 6.3 Memory interfaces

### 6.3.1 Flash memory program and erase specifications

#### NOTE

All timing, voltage, and current numbers specified in this section are defined for a single embedded flash memory within an SoC, and represent average currents for given supplies and operations.

[Table 29](#) shows the estimated Program/Erase times.

**Table 29. Flash memory program and erase specifications**

| Symbol              | Characteristic <sup>1</sup>        | Typ <sup>2</sup> | Factory Programming <sup>3, 4</sup> |                              | Field Update                     |                           |                  | Unit |
|---------------------|------------------------------------|------------------|-------------------------------------|------------------------------|----------------------------------|---------------------------|------------------|------|
|                     |                                    |                  | Initial Max                         | Initial Max, Full Temp       | Typical End of Life <sup>5</sup> | Lifetime Max <sup>6</sup> |                  |      |
|                     |                                    |                  | 20°C ≤T <sub>A</sub> ≤30°C          | -40°C ≤T <sub>J</sub> ≤150°C | -40°C ≤T <sub>J</sub> ≤150°C     | ≤ 1,000 cycles            | ≤ 250,000 cycles |      |
| t <sub>dwpgm</sub>  | Doubleword (64 bits) program time  | 43               | 100                                 | 150                          | 55                               | 500                       |                  | μs   |

| t <sub>64kers</sub>  | 64 KB Block erase time      | 315              | 490                                 | 590                    | 420                              | 1,600                      |                              | ms   |
| t <sub>64kpgm</sub>  | 64 KB Block program time    | 138              | 180                                 | 210                    | 170                              | 1,600                      |                              | ms   |
| t <sub>256kers</sub> | 256 KB Block erase time     | 884              | 1,520                               | 2,030                  | 1,080                            | 4,000                      | —                            | ms   |
| t <sub>256kpgm</sub> | 256 KB Block program time   | 552              | 720                                 | 880                    | 650                              | 4,000                      | —                            | ms   |

1. Program times are actual hardware programming times and do not include software overhead. Block program times assume quad-page programming.
2. Typical program and erase times represent the median performance and assume nominal supply values and operation at 25 °C. Typical program and erase times may be used for throughput calculations.
3. Conditions: ≤ 150 cycles, nominal voltage.
4. Plant Programming times provide guidance for timeout limits used in the factory.
5. Typical End of Life program and erase times represent the median performance and assume nominal supply values. Typical End of Life program and erase values may be used for throughput calculations.
6. Conditions: -40°C ≤ T<sub>J</sub> ≤ 150°C, full spec voltage.

## 6.3.2 Flash memory Array Integrity and Margin Read specifications

**Table 30. Flash memory Array Integrity and Margin Read specifications**

| Symbol                 | Characteristic                                                | Min    | Typical | Max                                            | Units |
|------------------------|---------------------------------------------------------------|--------|---------|------------------------------------------------|-------|
| t <sub>ai16kseq</sub>  | Array Integrity time for sequential sequence on 16 KB block.  | —      | —       | 512 x T <sub>period</sub> x N <sub>read</sub>  | —     |
| t <sub>ai32kseq</sub>  | Array Integrity time for sequential sequence on 32 KB block.  | —      | —       | 1024 x T <sub>period</sub> x N <sub>read</sub> | —     |
| t <sub>ai64kseq</sub>  | Array Integrity time for sequential sequence on 64 KB block.  | —      | —       | 2048 x T <sub>period</sub> x N <sub>read</sub> | —     |
| t <sub>ai256kseq</sub> | Array Integrity time for sequential sequence on 256 KB block. | —      | —       | 8192 x T <sub>period</sub> x N <sub>read</sub> | —     |
| t <sub>mr16kseq</sub>  | Margin Read time for sequential sequence on 16 KB block.      | 73.81  | —       | 110.7                                          | μs    |
| t <sub>mr32kseq</sub>  | Margin Read time for sequential sequence on 32 KB block.      | 128.43 | —       | 192.6                                          | μs    |
| t <sub>mr64kseq</sub>  | Margin Read time for sequential sequence on 64 KB block.      | 237.65 | —       | 356.5                                          | μs    |
| t <sub>mr256kseq</sub> | Margin Read time for sequential sequence on 256 KB block.     | 893.01 | —       | 1,339.5                                        | μs    |

### 6.3.3 Flash memory module life specifications

Table 31. Flash memory module life specifications

| Symbol           | Characteristic                                                              | Conditions                        | Min     | Typical | Units      |
|------------------|-----------------------------------------------------------------------------|-----------------------------------|---------|---------|------------|
| Array P/E cycles | Number of program/erase cycles per block for 16 KB, 32 KB and 64 KB blocks. | —                                 | 250,000 | —       | P/E cycles |
|                  | Number of program/erase cycles per block for 256 KB blocks.                 | —                                 | 1,000   | 250,000 | P/E cycles |
| Data retention   | Minimum data retention.                                                     | Blocks with 0 - 1,000 P/E cycles. | 50      | —       | Years      |
|                  |                                                                             | Blocks with 100,000 P/E cycles.   | 20      | —       | Years      |
|                  |                                                                             | Blocks with 250,000 P/E cycles.   | 10      | —       | Years      |

### 6.3.4 Data retention vs program/erase cycles

Graphically, Data Retention versus Program/Erase Cycles can be represented by the following figure. The spec window represents qualified limits. The extrapolated dotted line demonstrates technology capability, however is beyond the qualification limits.

### 6.3.5 Flash memory AC timing specifications

**Table 32. Flash memory AC timing specifications**

| Symbol        | Characteristic                                                                                                                                                                                                               | Min                                              | Typical                                        | Max                                              | Units   |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|------------------------------------------------|--------------------------------------------------|---------|
| $t_{psus}$    | Time from setting the MCR-PSUS bit until MCR-DONE bit is set to a 1.                                                                                                                                                         | —                                                | 9.4<br>plus four<br>system<br>clock<br>periods | 11.5<br>plus four<br>system<br>clock<br>periods  | $\mu s$ |
| $t_{esus}$    | Time from setting the MCR-ESUS bit until MCR-DONE bit is set to a 1.                                                                                                                                                         | —                                                | 16<br>plus four<br>system<br>clock<br>periods  | 20.8<br>plus four<br>system<br>clock<br>periods  | $\mu s$ |
| $t_{res}$     | Time from clearing the MCR-ESUS or PSUS bit with EHV = 1 until DONE goes low.                                                                                                                                                | —                                                | —                                              | 100                                              | ns      |
| $t_{done}$    | Time from 0 to 1 transition on the MCR-EHV bit initiating a program/erase until the MCR-DONE bit is cleared.                                                                                                                 | —                                                | —                                              | 5                                                | ns      |
| $t_{dones}$   | Time from 1 to 0 transition on the MCR-EHV bit aborting a program/erase until the MCR-DONE bit is set to a 1.                                                                                                                | —                                                | 16<br>plus four<br>system<br>clock<br>periods  | 20.8<br>plus four<br>system<br>clock<br>periods  | $\mu s$ |
| $t_{drcv}$    | Time to recover once exiting low power mode.                                                                                                                                                                                 | 16<br>plus seven<br>system<br>clock<br>periods.  | —                                              | 45<br>plus seven<br>system<br>clock<br>periods   | $\mu s$ |
| $t_{aistart}$ | Time from 0 to 1 transition of UT0-AIE initiating a Margin Read or Array Integrity until the UT0-AID bit is cleared. This time also applies to the resuming from a suspend or breakpoint by clearing AISUS or clearing NAIBP | —                                                | —                                              | 5                                                | ns      |
| $t_{aistop}$  | Time from 1 to 0 transition of UT0-AIE initiating an Array Integrity abort until the UT0-AID bit is set. This time also applies to the UT0-AISUS to UT0-AID setting in the event of a Array Integrity suspend request.       | —                                                | —                                              | 80<br>plus fifteen<br>system<br>clock<br>periods | ns      |
| $t_{mrstop}$  | Time from 1 to 0 transition of UT0-AIE initiating a Margin Read abort until the UT0-AID bit is set. This time also applies to the UT0-AISUS to UT0-AID setting in the event of a Margin Read suspend request.                | 10.36<br>plus four<br>system<br>clock<br>periods | —                                              | 20.42<br>plus four<br>system<br>clock<br>periods | $\mu s$ |

### 6.3.6 Flash read wait state and address pipeline control settings

The following table describes the recommended RWSC and APC settings at various operating frequencies based on specified intrinsic flash access times of the flash module controller array at 125 °C.

**Table 33. Flash Read Wait State and Address Pipeline Control Combinations**

| Flash frequency            | RWSC setting | APC setting |
|----------------------------|--------------|-------------|
| 0 MHz < fFlash ≤ 33 MHz    | 0            | 0           |
| 33 MHz < fFlash ≤ 100 MHz  | 2            | 1           |
| 100 MHz < fFlash ≤ 133 MHz | 3            | 1           |
| 133 MHz < fFlash ≤ 160 MHz | 4            | 1           |

## 6.4 Communication interfaces

### 6.4.1 DSPI timing

**Table 34. DSPI electrical specifications**

| No | Symbol            | Parameter                  | Conditions                                         | High Speed Mode <sup>1</sup> |                          | low Speed mode |     | Unit |
|----|-------------------|----------------------------|----------------------------------------------------|------------------------------|--------------------------|----------------|-----|------|
|    |                   |                            |                                                    | Min                          | Max                      | Min            | Max |      |
| 1  | t <sub>SCK</sub>  | DSPI cycle time            | Master                                             | 25                           | —                        | 50             | —   | ns   |
|    |                   |                            | Slave (MTFE = 0)                                   | 40                           | —                        | 60             | —   |      |
| 2  | t <sub>CSC</sub>  | PCS to SCK delay           | —                                                  | 16                           | —                        | —              | —   | ns   |
| 3  | t <sub>ASC</sub>  | After SCK delay            | —                                                  | 16                           | —                        | —              | —   | ns   |
| 4  | t <sub>SDC</sub>  | SCK duty cycle             | —                                                  | t <sub>SCK</sub> /2 - 10     | t <sub>SCK</sub> /2 + 10 | —              | —   | ns   |
| 5  | t <sub>A</sub>    | Slave access time          | $\overline{SS}$ active to SOUT valid               | —                            | 40                       | —              | —   | ns   |
| 6  | t <sub>DIS</sub>  | Slave SOUT disable time    | $\overline{SS}$ inactive to SOUT High-Z or invalid | —                            | 10                       | —              | —   | ns   |
| 7  | t <sub>PCSC</sub> | PCSx to PCSS time          | —                                                  | 13                           | —                        | —              | —   | ns   |
| 8  | t <sub>PASC</sub> | PCSS to PCSx time          | —                                                  | 13                           | —                        | —              | —   | ns   |
| 9  | t <sub>SUI</sub>  | Data setup time for inputs | Master (MTFE = 0)                                  | NA                           | —                        | 20             | —   | ns   |
|    |                   |                            | Slave                                              | 2                            | —                        | 2              | —   |      |
|    |                   |                            | Master (MTFE = 1, CPHA = 0)                        | 15                           | —                        | 8 <sup>2</sup> | —   |      |

|    |           |                             | Master (MTFE = 1, CPHA = 1) | —                            | 4   | —               | 4               |      |
| 12 | $t_{HO}$  | Data hold time for outputs  | Master (MTFE = 0)           | NA                           | —   | -2              | —               | ns   |
|    |           |                             | Slave                       | 4                            | —   | 6               | —               |      |
|    |           |                             | Master (MTFE = 1, CPHA = 0) | -2                           | —   | 10 <sup>2</sup> | —               |      |
|    |           |                             | Master (MTFE = 1, CPHA = 1) | -2                           | —   | -2              | —               |      |

1. Only one {SIN,SOUT and SCK} group per DSPI/SPI will support high frequency mode. See [Table 3](#).

2. SMPL\_PTR should be set to 1

## NOTE

### Restriction For High Speed modes

- DSPI2, DSPI3, SPI1 and SPI2 will support 40MHz Master mode SCK
- DSPI2, DSPI3, SPI1 and SPI2 will support 25MHz Slave SCK frequency
- Only one {SIN,SOUT and SCK} group per DSPI/SPI will support high frequency mode. See [Table 36](#).
- For Master mode MTFE will be 1 for high speed mode
- For high speed slaves, their master have to be in MTFE=1 mode or should be able to support 15ns tSUO delay

## NOTE

For numbers shown in the following figures, see [Table 34](#)

**Table 35. Continuous SCK timing**

| Spec | Characteristics     | Pad Drive/Load | Value  |       |
|------|---------------------|----------------|--------|-------|
|      |                     |                | Min    | Max   |
| tSCK | SCK cycle timing    | strong/50 pF   | 100 ns | -     |
| -    | PCS valid after SCK | strong/50 pF   | -      | 15 ns |
| -    | PCS valid after SCK | strong/50 pF   | -4 ns  | -     |

**Table 36. DSPI high speed mode I/Os**

| DSPI  | High speed SCK | High speed SIN | High speed SOUT |
|-------|----------------|----------------|-----------------|
| DSPI2 | GPIO[78]       | GPIO[76]       | GPIO[77]        |
| DSPI3 | GPIO[100]      | GPIO[101]      | GPIO[98]        |
| SPI1  | GPIO[173]      | GPIO[175]      | GPIO[176]       |
| SPI2  | GPIO[79]       | GPIO[110]      | GPIO[111]       |

## 6.4.2 FlexRay electrical specifications

### 6.4.2.1 FlexRay timing

This section provides the FlexRay Interface timing characteristics for the input and output signals. It should be noted that these are recommended numbers as per the FlexRay EPL v3.0 specification, and subject to change per the final timing analysis of the device.

6.4.2.2 TxEN

Figure 17. TxEN signal

Table 37. TxEN output characteristics<sup>1</sup>

| Name                      | Description                                                                            | Min | Max | Unit |
|---------------------------|----------------------------------------------------------------------------------------|-----|-----|------|
| dCCTxEN <sub>RISE25</sub> | Rise time of TxEN signal at CC                                                         | —   | 9   | ns   |
| dCCTxEN <sub>FALL25</sub> | Fall time of TxEN signal at CC                                                         | —   | 9   | ns   |
| dCCTxEN <sub>01</sub>     | Sum of delay between Clk to Q of the last FF and the final output buffer, rising edge  | —   | 25  | ns   |
| dCCTxEN <sub>10</sub>     | Sum of delay between Clk to Q of the last FF and the final output buffer, falling edge | —   | 25  | ns   |

1. All parameters specified for V<sub>DD\_HV\_IOx</sub> = 3.3 V -5%, +±10%, TJ = -40 °C / 150 °C, TxEN pin load maximum 25 pF

Figure 18. TxEN signal propagation delays

### 6.4.2.3 TxD

Figure 19. TxD Signal

Table 38. TxD output characteristics

| Name                                               | Description <sup>1</sup>                                   | Min   | Max            | Unit |
|----------------------------------------------------|------------------------------------------------------------|-------|----------------|------|
| dCCT <sub>xAsym</sub>                              | Asymmetry of sending CC @ 25 pF load (=dCCTxD50% - 100 ns) | -2.45 | 2.45           | ns   |
| dCCTxD <sub>RISE25</sub> +dCCTxD <sub>FALL25</sub> | Sum of Rise and Fall time of TxD signal at the output      | —     | 9 <sup>2</sup> | ns   |

Table continues on the next page...

**Table 38. TxD output characteristics (continued)**

| Name                 | Description <sup>1</sup>                                                               | Min | Max | Unit |
|----------------------|----------------------------------------------------------------------------------------|-----|-----|------|
| dCCTxD <sub>01</sub> | Sum of delay between Clk to Q of the last FF and the final output buffer, rising edge  | —   | 25  | ns   |
| dCCTxD <sub>10</sub> | Sum of delay between Clk to Q of the last FF and the final output buffer, falling edge | —   | 25  | ns   |

1. All parameters specified for  $V_{DD\_HV\_IOx} = 3.3\text{ V} \pm 5\%, \pm 10\%$ ,  $T_J = -40\text{ }^{\circ}\text{C} / 150\text{ }^{\circ}\text{C}$ , TxD pin load maximum 25 pF.
2. For  $3.3\text{ V} \pm 10\%$  operation, this specification is 10 ns.

\*FlexRay Protocol Engine Clock

**Figure 20. TxD Signal propagation delays**

#### 6.4.2.4 RxD

**Table 39. RxD input characteristic**

| Name                 | Description <sup>1</sup>                                                    | Min | Max | Unit |
|----------------------|-----------------------------------------------------------------------------|-----|-----|------|
| C_CCRxD              | Input capacitance on RxD pin                                                | —   | 7   | pF   |
| uCCLogic_1           | Threshold for detecting logic high                                          | 35  | 70  | %    |
| uCCLogic_0           | Threshold for detecting logic low                                           | 30  | 65  | %    |
| dCCRxD <sub>01</sub> | Sum of delay from actual input to the D input of the first FF, rising edge  | —   | 10  | ns   |
| dCCRxD <sub>10</sub> | Sum of delay from actual input to the D input of the first FF, falling edge | —   | 10  | ns   |

1. All parameters specified for  $VDD\_HV\_IOx = 3.3\text{ V} \pm 5\%$ ,  $\pm 10\%$ ,  $T_J = -40\text{ }^{\circ}\text{C} / 150\text{ }^{\circ}\text{C}$ .

### 6.4.3 uSDHC specifications

Table 40. uSDHC switching specifications

| Num                                                                         | Symbol           | Description                           | Min. | Max. | Unit |
|-----------------------------------------------------------------------------|------------------|---------------------------------------|------|------|------|
| <b>Card input clock</b>                                                     |                  |                                       |      |      |      |
| SD1                                                                         | fpp              | Clock frequency (Identification mode) | 0    | 400  | kHz  |
|                                                                             | fpp              | Clock frequency (SD\SDIO full speed)  | 0    | 25   | MHz  |
|                                                                             | fpp              | Clock frequency (SD\SDIO high speed)  | 0    | 40   | MHz  |
|                                                                             | fpp              | Clock frequency (MMC full speed)      | 0    | 20   | MHz  |
|                                                                             | f <sub>OD</sub>  | Clock frequency (MMC full speed)      | 0    | 40   | MHz  |
| SD2                                                                         | t <sub>WL</sub>  | Clock low time                        | 7    | —    | ns   |
| SD3                                                                         | t <sub>WH</sub>  | Clock high time                       | 7    | —    | ns   |
| SD4                                                                         | t <sub>TLH</sub> | Clock rise time                       | —    | 3    | ns   |
| SD5                                                                         | t <sub>THL</sub> | Clock fall time                       | —    | 3    | ns   |
| <b>SDHC output / card inputs SDHC_CMD, SDHC_DAT (reference to SDHC_CLK)</b> |                  |                                       |      |      |      |
| SD6                                                                         | t <sub>OD</sub>  | SDHC output delay (output valid)      | -5   | 6.5  | ns   |
| <b>SDHC input / card inputs SDHC_CMD, SDHC_DAT (reference to SDHC_CLK)</b>  |                  |                                       |      |      |      |
| SD7                                                                         | t <sub>ISU</sub> | SDHC input setup time                 | 5    | —    | ns   |
| SD8                                                                         | t <sub>IH</sub>  | SDHC input hold time                  | 0    | —    | ns   |

Figure 21. uSDHC timing

## 6.4.4 Ethernet switching specifications

The following timing specs are defined at the chip I/O pin and must be translated appropriately to arrive at timing specs/constraints for the physical interface.

### 6.4.4.1 MII signal switching specifications

The following timing specs meet the requirements for MII style interfaces for a range of transceiver devices.

#### NOTE

ENET0 supports the following xMII interfaces: MII, MII\_Lite and RMII. ENET1 supports the following xMII interfaces: MII\_Lite.

#### NOTE

It is only possible to use ENET0 and ENET1 simultaneously when both are configured for MII\_Lite.

#### NOTE

In certain pinout configurations ENET1 MII-Lite signals can be across multiple VDD\_HV\_A/B/C domains. If these configuration are used, VDD\_HV IO domains need to be at the same voltage (for example: 3.3V)

**Table 41. MII signal switching specifications**

| Symbol | Description                           | Min. | Max. | Unit         |
|--------|---------------------------------------|------|------|--------------|
| —      | RXCLK frequency                       | —    | 25   | MHz          |
| MII1   | RXCLK pulse width high                | 35%  | 65%  | RXCLK period |
| MII2   | RXCLK pulse width low                 | 35%  | 65%  | RXCLK period |
| MII3   | RXD[3:0], RXDV, RXER to RXCLK setup   | 5    | —    | ns           |
| MII4   | RXCLK to RXD[3:0], RXDV, RXER hold    | 5    | —    | ns           |
| —      | TXCLK frequency                       | —    | 25   | MHz          |
| MII5   | TXCLK pulse width high                | 35%  | 65%  | TXCLK period |
| MII6   | TXCLK pulse width low                 | 35%  | 65%  | TXCLK period |
| MII7   | TXCLK to TXD[3:0], TXEN, TXER invalid | 2    | —    | ns           |
| MII8   | TXCLK to TXD[3:0], TXEN, TXER valid   | —    | 25   | ns           |

Figure 22. RMII/MII transmit signal timing diagram

Figure 23. RMII/MII receive signal timing diagram

#### 6.4.4.2 RMII signal switching specifications

The following timing specs meet the requirements for RMII style interfaces for a range of transceiver devices.

Table 42. RMII signal switching specifications

| Num   | Description                                 | Min. | Max. | Unit            |
|-------|---------------------------------------------|------|------|-----------------|
| —     | EXTAL frequency (RMII input clock RMII_CLK) | —    | 50   | MHz             |
| RMII1 | RMII_CLK pulse width high                   | 35%  | 65%  | RMII_CLK period |
| RMII2 | RMII_CLK pulse width low                    | 35%  | 65%  | RMII_CLK period |
| RMII3 | RXD[1:0], CRS_DV, RXER to RMII_CLK setup    | 4    | —    | ns              |
| RMII4 | RMII_CLK to RXD[1:0], CRS_DV, RXER hold     | 2    | —    | ns              |
| RMII7 | RMII_CLK to TXD[1:0], TXEN invalid          | 4    | —    | ns              |
| RMII8 | RMII_CLK to TXD[1:0], TXEN valid            | —    | 15   | ns              |

## Connecting two MPC5748G MCUs via ENET without a PHY

To connect two MPC5748G MCUs for an application together through ENET without a PHY, the following steps should be followed:

1. MCU #1 ENET\_0 should be connected to MCU #2 ENET\_0
2. MCU #1 ENET\_1 should be connected to MCU #2 ENET\_1

This ensures conformity to ENET set-up and hold times. Note that the MPC5748G datasheet quotes worst case set-up and hold times when connecting MCU #1 ENET\_0 to MCU #2 ENET\_1.

## 6.4.5 MediaLB (MLB) electrical specifications

### 6.4.5.1 MLB 3-pin interface DC characteristics

The section lists the MLB 3-pin interface electrical characteristics.

**Table 43. MediaLB 3-Pin Interface Electrical DC Specifications**

| Parameter                   | Symbol   | Test Conditions          | Min | Max      | Unit          |
|-----------------------------|----------|--------------------------|-----|----------|---------------|
| Maximum input voltage       | —        | —                        | —   | 3.6      | V             |
| Low level input threshold   | $V_{IL}$ | —                        | —   | 0.7      | V             |
| High level input threshold  | $V_{IH}$ | See Note <sup>1</sup>    | 1.8 | —        | V             |
| Low level output threshold  | $V_{OL}$ | $I_{OL} = -6 \text{ mA}$ | —   | 0.4      | V             |
| High level output threshold | $V_{OH}$ | $I_{OH} = -6 \text{ mA}$ | 2.0 | —        | V             |
| Input leakage current       | $I_L$    | $0 < V_{in} < V_{DD}$    | —   | $\pm 10$ | $\mu\text{A}$ |

1. Higher  $V_{IH}$  thresholds can be used; however, the risks associated with less noise margin in the system must be evaluated and assumed by the customer.

### 6.4.5.2 MLB 3-pin interface electrical specifications

This section describes the timing electrical information of the MLB module.

### Figure 24. MediaLB 3-Pin Timing

Ground = 0.0 V; Load Capacitance = 60 pF, input transition= 1 ns ; MediaLB speed = 256/512 Fs; Fs = 48 kHz; all timing parameters specified from the valid voltage threshold as listed below; unless otherwise noted.

### Table 44. MLB 3-Pin 256/512 Fs Timing Parameters

| Parameter                                            | Symbol       | Min          | Max         | Unit | Comment                                   |
|------------------------------------------------------|--------------|--------------|-------------|------|-------------------------------------------|
| MLBCLK operating frequency                           | $f_{mck}$    | 11.264       | 25.6        | MHz  | 256xFs at 44.0 kHz,<br>512xFs at 50.0 kHz |
| MLBCLK rise time                                     | $t_{mck}^r$  |              | 3           | ns   | $V_{IL}$ to $V_{IH}$                      |
| MLBCLK fall time                                     | $t_{mck}^f$  |              | 3           | ns   | $V_{IH}$ to $V_{IL}$                      |
| MLBCLK low time <sup>1</sup>                         | $t_{mck}^l$  | 30<br>14     | —           | ns   | 256xFs<br>512xFs                          |
| MLBCLK high time                                     | $t_{mck}^h$  | 30<br>14     | —           | ns   | 256xFs<br>512xFs                          |
| MLBSIG/MLBDAT receiver input setup to MLBCLK falling | $t_{dsmcf}$  | 1            | —           | ns   | —                                         |
| MLBSIG/MLBDAT receiver input hold from MLBCLK low    | $t_{dhmcf}$  | $t_{mcf dz}$ | —           | ns   | —                                         |
| MLBSIG/MLBDAT output valid from MLBCLK low           | $t_{mcf dz}$ | 0            | $t_{mck}^l$ | ns   | 2                                         |
| Bus output hold from MLBCLK low                      | $t_{mdzh}$   | 4            | —           | ns   | 2                                         |

1. MLBCLK low/high time includes the pluse width variation.
2. The MediaLB driver can release the MLBDAT/MLBSIG line as soon as MLBCLK is low; however, the logic state of the final driven bit on the line must remain on the bus for trndzh. Therefore, coupling must be minimized while meeting the maximum load capacitance listed.

## USB electrical specifications

Ground = 0.0 V; Load Capacitance = 40 pF, input transition = 1 ns; MediaLB speed = 1024 Fs; Fs = 48 kHz; all timing parameters specified from the valid voltage threshold as listed below; unless otherwise noted.

**Table 45. MLB 3-Pin 1024 Fs Timing Parameters**

| Parameter                                            | Symbol      | Min         | Max        | Unit | Comment               |
|------------------------------------------------------|-------------|-------------|------------|------|-----------------------|
| MLBCLK Operating Frequency <sup>1</sup>              | $f_{mck}$   | 45.056      | -          | MHz  | 1024 x fs at 44.0 kHz |
|                                                      |             | -           | 51.2       | MHz  | 1024 x fs at 50.0 kHz |
| MLBCLK rise time                                     | $t_{mckr}$  |             | 1          | ns   | $V_{IL}$ to $V_{IH}$  |
| MLBCLK fall time                                     | $t_{mckf}$  |             | 1          | ns   | $V_{IH}$ to $V_{IL}$  |
| MLBCLK low time                                      | $t_{mckl}$  | 6.1         | —          | ns   | 2                     |
| MLBCLK high time                                     | $t_{mckh}$  | 9.3         | —          | ns   | 2                     |
| MLBSIG/MLBDAT receiver input setup to MLBCLK falling | $t_{dsmcf}$ | 1           | —          | ns   |                       |
| MLBSIG/MLBDAT receiver input hold from MLBCLK low    | $t_{dhmcf}$ | $t_{mcfdz}$ | —          | ns   |                       |
| MLBSIG/MLBDAT output valid from MLBCLK low           | $t_{mcfdz}$ | 0           | $t_{mckl}$ | ns   | 3                     |
| Bus Hold from MLBCLK low                             | $t_{mdzh}$  | 2           | —          | ns   | 3                     |

1. The controller can shut off MLBCLK to place MediaLB in a low-power state. Depending on the time the clock is shut off, a runt pulse can occur on MLBCLK.
2. MLBCLK low/high time includes the pluse width variation.
3. The MediaLB driver can release the MLBDAT/MLBSIG line as soon as MLBCLK is low; however, the logic state of the final driven bit on the line must remain on the bus for  $t_{mdzh}$ . Therefore, coupling must be minimized while meeting the maximum load capacitance listed.

## 6.4.6 USB electrical specifications

### 6.4.6.1 USB electrical specifications

The USB electricals for the USB On-the-Go module conform to the standards documented by the Universal Serial Bus Implementers Forum. For the most up-to-date standards, visit <http://www.usb.org>.

### 6.4.6.2 ULPI timing specifications

The ULPI interface is fully compliant with the industry standard UTMI+ Low Pin Interface. Control and data timing requirements for the ULPI pins are given in the following table. These timings apply to synchronous mode only. All timings are measured with respect to the clock as seen at the USB\_CLKIN pin.

**Table 46. ULPI timing specifications**

| Num | Description                     | Min. | Typ.  | Max. | Unit |
|-----|---------------------------------|------|-------|------|------|
|     | USB_CLKIN operating frequency   | —    | 60    | —    | MHz  |
|     | USB_CLKIN duty cycle            | —    | 50    | —    | %    |
| U1  | USB_CLKIN clock period          | —    | 16.67 | —    | ns   |
| U2  | Input setup (control and data)  | 5    | —     | —    | ns   |
| U3  | Input hold (control and data)   | 1    | —     | —    | ns   |
| U4  | Output valid (control and data) | —    | —     | 9.5  | ns   |
| U5  | Output hold (control and data)  | 1    | —     | —    | ns   |

**Figure 25. ULPI timing diagram**

## 6.4.7 SAI electrical specifications

All timing requirements are specified relative to the clock period or to the minimum allowed clock period of a device

**Table 47. Master mode SAI Timing**

| no  | Parameter                                  | Value |     | Unit        |
|-----|--------------------------------------------|-------|-----|-------------|
|     |                                            | Min   | Max |             |
|     | Operating Voltage                          | 2.7   | 3.6 | V           |
| S1  | SAI_MCLK cycle time                        | 40    | -   | ns          |
| S2  | SAI_MCLK pulse width high/low              | 45%   | 55% | MCLK period |
| S3  | SAI_BCLK cycle time                        | 80    | -   | BCLK period |
| S4  | SAI_BCLK pulse width high/low              | 45%   | 55% | ns          |
| S5  | SAI_BCLK to SAI_FS output valid            | -     | 15  | ns          |
| S6  | SAI_BCLK to SAI_FS output invalid          | 0     | -   | ns          |
| S7  | SAI_BCLK to SAI_TXD valid                  | -     | 15  | ns          |
| S8  | SAI_BCLK to SAI_TXD invalid                | 0     | -   | ns          |
| S9  | SAI_RXD/SAI_FS input setup before SAI_BCLK | 28    | -   | ns          |
| S10 | SAI_RXD/SAI_FS input hold after SAI_BCLK   | 0     | -   | ns          |

Figure 26. Master mode SAI Timing

Table 48. Slave mode SAI Timing

| No  | Parameter                                 | Value |     | Unit        |
|-----|-------------------------------------------|-------|-----|-------------|
|     |                                           | Min   | Max |             |
|     | Operating Voltage                         | 2.7   | 3.6 | V           |
| S11 | SAI_BCLK cycle time (input)               | 80    | -   | ns          |
| S12 | SAI_BCLK pulse width high/low (input)     | 45%   | 55% | BCLK period |
| S13 | SAI_FS input setup before SAI_BCLK        | 10    | -   | ns          |
| S14 | SAI_FS input hold after SAI_BCLK          | 2     | -   | ns          |
| S15 | SAI_BCLK to SAI_TXD/SAI_FS output valid   | -     | 28  | ns          |
| S16 | SAI_BCLK to SAI_TXD/SAI_FS output invalid | 0     | -   | ns          |
| S17 | SAI_RXD setup before SAI_BCLK             | 10    | -   | ns          |
| S18 | SAI_RXD hold after SAI_BCLK               | 2     | -   | ns          |

Figure 27. Slave mode SAI Timing

## 6.5 Debug specifications

### 6.5.1 JTAG interface timing

Table 49. JTAG pin AC electrical characteristics <sup>1</sup>

| #  | Symbol               | Characteristic                                         | Min  | Max              | Unit |
|----|----------------------|--------------------------------------------------------|------|------------------|------|
| 1  | $t_{JCYC}$           | TCK Cycle Time <sup>2</sup>                            | 62.5 | —                | ns   |
| 2  | $t_{JDC}$            | TCK Clock Pulse Width                                  | 40   | 60               | %    |
| 3  | $t_{TCKRISE}$        | TCK Rise and Fall Times (40% - 70%)                    | —    | 3                | ns   |
| 4  | $t_{TMSS}, t_{TDIS}$ | TMS, TDI Data Setup Time                               | 5    | —                | ns   |
| 5  | $t_{TMSH}, t_{TDIH}$ | TMS, TDI Data Hold Time                                | 5    | —                | ns   |
| 6  | $t_{TDOV}$           | TCK Low to TDO Data Valid                              | —    | 20 <sup>3</sup>  | ns   |
| 7  | $t_{TDOI}$           | TCK Low to TDO Data Invalid                            | 0    | —                | ns   |
| 8  | $t_{TDOHZ}$          | TCK Low to TDO High Impedance                          | —    | 15               | ns   |
| 11 | $t_{BSDV}$           | TCK Falling Edge to Output Valid                       | —    | 600 <sup>4</sup> | ns   |
| 12 | $t_{BSDVZ}$          | TCK Falling Edge to Output Valid out of High Impedance | —    | 600              | ns   |
| 13 | $t_{BSDHZ}$          | TCK Falling Edge to Output High Impedance              | —    | 600              | ns   |
| 14 | $t_{BSDST}$          | Boundary Scan Input Valid to TCK Rising Edge           | 15   | —                | ns   |
| 15 | $t_{BSDHT}$          | TCK Rising Edge to Boundary Scan Input Invalid         | 15   | —                | ns   |

- These specifications apply to JTAG boundary scan only.
- This timing applies to TDI, TDO, TMS pins, however, actual frequency is limited by pad type for EXTEST instructions. Refer to pad specification for allowed transition frequency
- Timing includes TCK pad delay, clock tree delay, logic delay and TDO output pad delay.
- Applies to all pins, limited by pad slew rate. Refer to IO delay and transition specification and add 20 ns for JTAG delay.

## 6.5.2 Nexus timing

Table 50. Nexus debug port timing <sup>1</sup>

| No. | Symbol                       | Parameter                                           | Conditions | Min  | Max  | Unit       |
|-----|------------------------------|-----------------------------------------------------|------------|------|------|------------|
| 1   | $t_{MCYC}$                   | MCKO Cycle Time                                     | —          | 15.6 | —    | ns         |
| 2   | $t_{MDC}$                    | MCKO Duty Cycle                                     | —          | 40   | 60   | %          |
| 3   | $t_{MDOV}$                   | MCKO Low to MDO, MSEO, EVTO Data Valid <sup>2</sup> | —          | -0.1 | 0.25 | $t_{MCYC}$ |
| 4   | $t_{EVTIPW}$                 | EVTI Pulse Width                                    | —          | 4    | —    | $t_{TCYC}$ |
| 5   | $t_{EVTOPW}$                 | EVTO Pulse Width                                    | —          | 1    | —    | $t_{MCYC}$ |
| 6   | $t_{TCYC}$                   | TCK Cycle Time <sup>3</sup>                         | —          | 62.5 | —    | ns         |
| 7   | $t_{TDC}$                    | TCK Duty Cycle                                      | —          | 40   | 60   | %          |
| 8   | $t_{NTDIS}$ ,<br>$t_{NTMSS}$ | TDI, TMS Data Setup Time                            | —          | 8    | —    | ns         |

Table continues on the next page...

**Table 50. Nexus debug port timing <sup>1</sup> (continued)**

| No. | Symbol                       | Parameter                     | Condition<br>s | Min | Max | Unit |
|-----|------------------------------|-------------------------------|----------------|-----|-----|------|
| 9   | $t_{NTDIH}$ ,<br>$t_{NTMSH}$ | TDI, TMS Data Hold Time       | —              | 5   | —   | ns   |
| 10  | $t_{JOV}$                    | TCK Low to TDO/RDY Data Valid | —              | 0   | 25  | ns   |

1. JTAG specifications in this table apply when used for debug functionality. All Nexus timing relative to MCKO is measured from 50% of MCKO and 50% of the respective signal.
2. For all Nexus modes except DDR mode, MDO,  $\overline{\text{MSEO}}$ , and  $\overline{\text{EVTO}}$  data is held valid until next MCKO low cycle.
3. The system clock frequency needs to be four times faster than the TCK frequency.

**Figure 31. Nexus output timing****Figure 32. Nexus EVTI Input Pulse Width**

Figure 33. Nexus TDI, TMS, TDO timing

6.5.3 WKPU/NMI timing

Table 51. WKPU/NMI glitch filter

| No. | Symbol       | Parameter                        | Min | Typ | Max | Unit |
|-----|--------------|----------------------------------|-----|-----|-----|------|
| 1   | $W_{FNMI}$   | NMI pulse width that is rejected | —   | —   | 20  | ns   |
| 2   | $W_{NFNMI}D$ | NMI pulse width that is passed   | 400 | —   | —   | ns   |

## 6.5.4 External interrupt timing (IRQ pin)

Table 52. External interrupt timing specifications

| No. | Symbol     | Parameter             | Conditions | Min | Max | Unit      |
|-----|------------|-----------------------|------------|-----|-----|-----------|
| 1   | $t_{IPWL}$ | IRQ pulse width low   | —          | 3   | —   | $t_{CYC}$ |
| 2   | $t_{IPWH}$ | IRQ pulse width high  | —          | 3   | —   | $t_{CYC}$ |
| 3   | $t_{ICYC}$ | IRQ edge to edge time | —          | 6   | —   | $t_{CYC}$ |

These values apply when IRQ pins are configured for rising edge or falling edge events, but not both.

Figure 34. External interrupt timing

## 7 Thermal attributes

### 7.1 Thermal attributes

| Board type        | Symbol                | Description                                                      | 176LQFP | Unit | Notes   |
|-------------------|-----------------------|------------------------------------------------------------------|---------|------|---------|
| Single-layer (1s) | $R_{\theta JA}$       | Thermal resistance, junction to ambient (natural convection)     | 45.5    | °C/W | 1, 2    |
| Four-layer (2s2p) | $R_{\theta JA}$       | Thermal resistance, junction to ambient (natural convection)     | 23.1    | °C/W | 1, 2, 3 |
| Single-layer (1s) | $R_{\theta JMA}$      | Thermal resistance, junction to ambient (200 ft./min. air speed) | 34.8    | °C/W | 1,3     |
| Four-layer (2s2p) | $R_{\theta JMA}$      | Thermal resistance, junction to ambient (200 ft./min. air speed) | 16      | °C/W | 1,3     |
| —                 | $R_{\theta JB}$       | Thermal resistance, junction to board                            | 9.4     | °C/W | 4       |
| —                 | $R_{\theta JCtop}$    | Thermal resistance, junction to case top                         | 9.5     | °C/W | 5       |
| —                 | $R_{\theta JCbottom}$ | Thermal resistance, junction to case bottom                      | 0.2     | °C/W | 6       |

Table continues on the next page...

## Thermal attributes

| Board type | Symbol      | Description                                                 | 176LQFP | Unit | Notes |
|------------|-------------|-------------------------------------------------------------|---------|------|-------|
| —          | $\Psi_{JT}$ | Thermal characterization parameter, junction to package top | 0.2     | °C/W | 7     |

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance
2. Per SEMI G38-87 and JEDEC JESD51-2 with the single layer board horizontal.
3. Per JEDEC JESD51-6 with the board horizontal.
4. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
6. Thermal resistance between the die and the solder pad on the bottom of the package based on simulation without any interface resistance.
7. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2.

| Board type        | Symbol           | Description                                                                     | 324 MAPBGA | Unit | Notes |
|-------------------|------------------|---------------------------------------------------------------------------------|------------|------|-------|
| Single-layer (1s) | $R_{\theta JA}$  | Thermal resistance, junction to ambient (natural convection)                    | 25.5       | °C/W | 1, 2  |
| Four-layer (2s2p) | $R_{\theta JA}$  | Thermal resistance, junction to ambient (natural convection)                    | 19.0       | °C/W | 1,23  |
| Single-layer (1s) | $R_{\theta JMA}$ | Thermal resistance, junction to ambient (200 ft./min. air speed)                | 18.1       | °C/W | 1, 3  |
| Four-layer (2s2p) | $R_{\theta JMA}$ | Thermal resistance, junction to ambient (200 ft./min. air speed)                | 14.8       | °C/W | 1,3   |
| —                 | $R_{\theta JB}$  | Thermal resistance, junction to board                                           | 10.4       | °C/W | 4     |
| —                 | $R_{\theta JC}$  | Thermal resistance, junction to case                                            | 8.4        | °C/W | 5     |
| —                 | $\Psi_{JT}$      | Thermal characterization parameter, junction to package top natural convection) | 0.45       | °C/W | 6     |
| —                 | $\Psi_{JB}$      | Thermal characterization parameter, junction to package top natural convection) | 2.65       | °C/W | 7     |

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.,
2. Per JEDEC JESD51-2 with the single layer board horizontal. Board meets JESD51-9 specification.
3. Per JEDEC JESD51-6 with the board horizontal
4. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2.
7. Thermal characterization parameter indicating the temperature difference between package bottom center and the junction temperature per JEDEC JESD51-12. When Greek letters are not available, the thermal characterization parameter is written as Psi-JB.

| Board type        | Symbol           | Description                                                                                        | 256 MAPBGA | Unit | Notes |
|-------------------|------------------|----------------------------------------------------------------------------------------------------|------------|------|-------|
| Single-layer (1s) | $R_{\theta JA}$  | Thermal resistance, junction to ambient (natural convection)                                       | 39.5       | °C/W | 1, 2  |
| Four-layer (2s2p) | $R_{\theta JA}$  | Thermal resistance, junction to ambient (natural convection)                                       | 22.9       | °C/W | 1,23  |
| Single-layer (1s) | $R_{\theta JMA}$ | Thermal resistance, junction to ambient (200 ft./min. air speed)                                   | 28.5       | °C/W | 1,3   |
| Four-layer (2s2p) | $R_{\theta JMA}$ | Thermal resistance, junction to ambient (200 ft./min. air speed)                                   | 18.3       | °C/W | 1,3   |
| —                 | $R_{\theta JB}$  | Thermal resistance, junction to board                                                              | 9.5        | °C/W | 4     |
| —                 | $R_{\theta JC}$  | Thermal resistance, junction to case                                                               | 5.8        | °C/W | 5     |
| —                 | $\Psi_{JT}$      | Thermal characterization parameter, junction to package top outside center (natural convection)    | 0.2        | °C/W | 6     |
| —                 | $\Psi_{JB}$      | Thermal characterization parameter, junction to package bottom outside center (natural convection) | 6.4        | °C/W | 7     |

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
2. Per JEDEC JESD51-2 with the single layer board horizontal. Board meets JESD51-9 specification.
3. Per JEDEC JESD51-6 with the board horizontal
4. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2.
7. Thermal characterization parameter indicating the temperature difference between package bottom center and the junction temperature per JEDEC JESD51-12. When Greek letters are not available, the thermal characterization parameter is written as Psi-JB.

## 8 Dimensions

### 8.1 Obtaining package dimensions

Package dimensions are provided in package drawing.

To find a package drawing, go to [www.nxp.com](http://www.nxp.com) and perform a keyword search for the drawing's document number:

| Package         | NXP Document Number |
|-----------------|---------------------|
| 176-pin LQFP-EP | 98ASA00673D         |
| 256 MAPBGA      | 98ASA00346D         |
| 324 MAPBGA      | 98ASA10582D         |

# 9 Pinouts

## 9.1 Package pinouts and signal descriptions

For package pinouts and signal descriptions, refer to the Reference Manual.

# 10 Reset sequence

This section describes different reset sequences and details the duration for which the device remains in reset condition in each of those conditions.

## 10.1 Reset sequence duration

[Table 53](#) specifies the minimum and the maximum reset sequence duration for the five different reset sequences described in [Reset sequence description](#).

**Table 53. RESET sequences**

| No. | Symbol            | Parameter                                      | T <sub>Reset</sub> |                  |     | Unit |
|-----|-------------------|------------------------------------------------|--------------------|------------------|-----|------|
|     |                   |                                                | Min                | Typ <sup>1</sup> | Max |      |
| 1   | T <sub>DRB</sub>  | Destructive Reset Sequence, BIST enabled       | 5.730              | 7.796            |     | ms   |
| 2   | T <sub>DR</sub>   | Destructive Reset Sequence, BIST disabled      | 0.111              | 0.182            |     | ms   |
| 3   | T <sub>ERLB</sub> | External Reset Sequence Long, Unsecure Boot    | 5.729              | 7.793            |     | ms   |
| 4   | T <sub>FRL</sub>  | Functional Reset Sequence Long, Unsecure Boot  | 0.110              | 0.179            |     | ms   |
| 5   | T <sub>FRS</sub>  | Functional Reset Sequence Short, Unsecure Boot | 0.007              | 0.009            |     | ms   |

1. The Typ value is applicable only if the reset sequence duration is not prolonged by an extended assertion of RESET\_B by an external reset generator.

## 10.2 BAF execution duration

Following table specifies the typical BAF execution time in case BAF boot header is present at first location (Typical) and last location (worst case). Total Boot time is the sum of reset sequence duration and BAF execution time.

**Table 54. BAF execution duration**

| BAF execution duration                             | Min | Typ | Max | Unit |
|----------------------------------------------------|-----|-----|-----|------|
| BAF execution time (boot header at first location) | -   | 200 | -   | μs   |
| BAF execution time (boot header at last location)  | -   | 320 | -   | μs   |

## 10.3 Reset sequence description

The figures in this section show the internal states of the device during the five different reset sequences. The dotted lines in the figures indicate the starting point and the end point for which the duration is specified in [Table 53](#).

With the beginning of DRUN mode, the first instruction is fetched and executed. At this point, application execution starts and the internal reset sequence is finished.

The following figures show the internal states of the device during the execution of the reset sequence and the possible states of the RESET\_B signal pin.

### NOTE

RESET\_B is a bidirectional pin. The voltage level on this pin can either be driven low by an external reset generator or by the device internal reset circuitry. A high level on this pin can only be generated by an external pullup resistor which is strong enough to overdrive the weak internal pulldown resistor. The rising edge on RESET\_B in the following figures indicates the time when the device stops driving it low. The reset sequence durations given in [Table 53](#) are applicable only if the internal reset sequence is not prolonged by an external reset generator keeping RESET\_B asserted low beyond the last Phase3.

## Reset sequence

**Figure 35. Destructive reset sequence, BIST enabled**

**Figure 36. Destructive reset sequence, BIST disabled**

**Figure 37. External reset sequence long, BIST enabled**

**Figure 38. Functional reset sequence long**

**Figure 39. Functional reset sequence short**

The reset sequences shown in [Figure 38](#) and [Figure 39](#) are triggered by functional reset events. RESET\_B is driven low during these two reset sequences only if the corresponding functional reset source (which triggered the reset sequence) was enabled to drive RESET\_B low for the duration of the internal reset sequence. See the RGM\_FBRE register in the device reference manual for more information.

## 11 Revision History

The following table provides a revision history for this document.

**Table 55. Revision History**

| Rev. No. | Date          | Substantial Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Information in this document is provided solely to enable system and software implementers to use NXP products. There are no express or implied copyright licenses granted hereunder to design or fabricate any integrated circuits based on the information in this document. NXP reserves the right to make changes without further notice to any products herein.

NXP makes no warranty, representation, or guarantee regarding the suitability of its products for any particular purpose, nor does NXP assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters that may be provided in NXP data sheets and/or specifications can and do vary in different applications, and actual performance may vary over time. All operating parameters, including "typicals," must be validated for each customer application by customer's technical experts. NXP does not convey any license under its patent rights nor the rights of others. NXP sells products pursuant to standard terms and conditions of sale, which can be found at the following address: [nxp.com/SalesTermsandConditions](http://nxp.com/SalesTermsandConditions).

While NXP has implemented advanced security features, all products may be subject to unidentified vulnerabilities. Customers are responsible for the design and operation of their applications and products to reduce the effect of these vulnerabilities on customer's applications and products, and NXP accepts no liability for any vulnerability that is discovered. Customers should implement appropriate design and operating safeguards to minimize the risks associated with their applications and products.
