### **Electrical Specifications** (Continued)

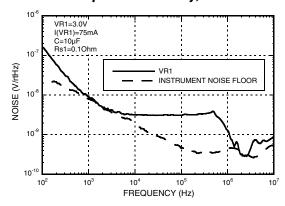

Parameter	Conditions	Min	Тур	Max	Units
Reference Voltage VREF	Vdd = 5.5V; REF cannot source/sink external current		1.21		V
Output Current VR1 [1]	$T_A = -40$ °C to $+85$ °C			80	mA
Output Current VR2, VR3 [1]	T <sub>A</sub> = -40°C to +85°C			20	mA
Output Current VR4 [1]	T <sub>A</sub> = -40°C to +85°C			120	mA
Total Output Current	T <sub>A</sub> = -40°C to +85°C			240	mA
Output Noise Spectral Density 10 Hz 100 Hz 1 kHz 10 kHz 10 kHz 100 kHz	Vdd = 5.5V; VRx = 3.05V; VR4 = 4.5V Measured on Application Schematic Maximum Load Current		2200 157 7 3 3		nV/√Hz
Integrated Output Noise 100 Hz to 100 kHz	Vdd = 5.5V; VRx = 3.05V		1.5		μVrms
Load Regulation, VR1	Vdd = 5.5V		0.01		% / mA
Load Regulation, VR2 & VR3	Vdd = 5.5V		0.02		% / mA
Load Regulation, VR4	Vdd = 5.5V		0.02		% / mA
PSRR  0 Hz (DC Line Regulation)  1 kHz  100 kHz  1 MHz  10 MHz  50 MHz	Vdd = 5.5V; Maximum load current		36 80 65 60 35 45		dB
Output Voltage Variation vs. Package Base Temperature 25°C to 85°C -40°C to 25°C	Vdd = 5.5V; Maximum load current		0.015 0.045		%/°C %/°C
Current Consumption (I <sub>GND</sub> )	Ven = Vdd = 5.5V; Maximum Load Current		1.9	2.3	mA
Power Down Current	Vdd = 5.5V; EN = Low; VRx outputs are floating (high - impedance) in Power-Down mode			1	μА
Start-Up Transient Time	0 to 90% of final voltage; Cref=1 µF; Cload=10 µF; Vdd = 5.5V		25		ms
EN Turn-On Delay	0 to 90% of final output voltage Cref = 1 μF; Cload = 10 μF; Vdd = 5.5V EN transition from 0 to Vdd		25		ms
Enable Input EN High Level		2		Vdd + 0.3	V
Enable Input EN Low Level		0		0.8	V
Output Load Capacitance	To guarantee stability, noise and PSRR performance	10			μF
Output Capacitor ESR	Required if no series resistor is used at the output. See "Stability" section.	0.2		2	Ohm
Output series resistance	Required if ESR is insufficient for one or more output capacitors. See "Stability" section.	0.1		1	Ohm

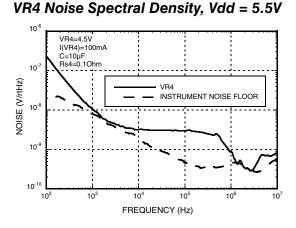

<sup>[1]</sup> The regulator does not include short-circuit or over-temperature protection circuitry. The outputs will withstand short-circuit conditions for a duration of less than 10s.

### **Absolute Maximum Ratings**

	,,,
Vdd to GND Voltage	+6.5V / -0.3V
EN to GND Voltage	Vdd + 0.5V / -0.3V
RDx / HVx to GND Voltage	Vdd + 0.5V / -0.3V
Thermal Resistance (Junction to ground paddle)	30 °C/W
Maximum Junction Temperature	+125 °C
Storage Temperature	-65 to +150 °C
Operating Temperature	-40 to +85 °C
ESD Sensitivity (HBM)	Class 1C

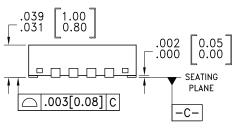

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. The absolute maximum ratings apply individually only and not in combination.

### **Pin Descriptions**

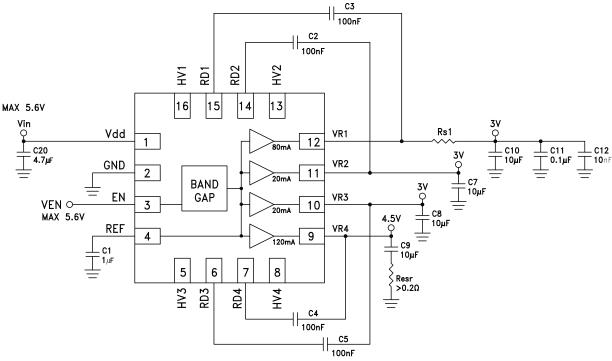

Pin Number	Function	Description	Interface Schematic
1	Vdd	Unregulated power supply input	
2	GND	Supply Ground	
3	EN	Enable Input, TTL Logic Level. The VRx outputs are floating (high impedance) when EN = Low.	EN O SOON =
4	REF	Reference voltage (bandgap) output. Cannot be used to source/sink current to/from external circuits	REFO
5	HV3	Sets VR3 to 5V output when connected to ground, otherwise no connection.	∘Vdd
8	HV4	Sets VR4 to 5V output when connected to ground, otherwise no connection.	HVx O RDx
13	HV2	Sets VR2 to 5V output when connected to ground, otherwise no connection.	
16	HV1	Sets VR1 to 5V output when connected to ground, otherwise no connection.	=
6	RD3	Resistive feedback for VR3, see "Output Voltage Adjust" section.	○ Vdd
7	RD4	Resistive feedback for VR4, see "Output Voltage Adjust" section.	BBu o
14	RD2	Resistive feedback for VR2, see "Output Voltage Adjust" section.	RDx O
15	RD1	Resistive feedback for VR1, see "Output Voltage Adjust" section.	\ \(\frac{\pm}{\pm}\\ \\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\
9	VR4	Regulator #4 Output	o Vdd
10	VR3	Regulator #3 Output	
11	VR2	Regulator #2 Output	VRx O
12	VR1	Regulator #1 Output	
Package Base	N/C	Should contact PCB metallic area for best thermal dissipation. Can be connected to Ground.	

# **QUAD LOW NOISE HIGH PSRR** LINEAR VOLTAGE REGULATOR

### **Application Schematic**

The specified noise performance requires the 1µF decoupling capacitor between pins REF and GND (C1) and the 100nF capacitors connected between output VRx (x=1,2,3,4) and the respective RDx pin (C2, C3, C4 and C5). If noise performance is not critical for a particular output, the 100nF capacitor can be omitted for the respective regulator. In this case, noise spectral density will typically increase by a factor of 20X at 10kHz. The 1µF REF capacitor causes a 25ms typical turn-on start-up time.

### Stability

Two approaches are recommended to manage the stability of the high-current regulators VR1 and VR4. If only one decoupling capacitor is used at the output, the capacitor series resistance Resr must be between 0.2 Ohm and 2 Ohm to insure stability across all loading conditions. This is shown at output VR4 in the application schematic. Note that ceramic capacitors typically have much lower Resr (as low as 0.02 Ohm at resonance) hence they will need a series resistor to insure stability.

In the case when several capacitors are connected at the output (which is often the case with noise and spurious sensitive circuits), an alternate approach is to insert a small resistor in series with the load but after the 100nF feedback capacitor. This is shown by Rs1 at the VR1 output in the application schematic. The minimum resistor value is 0.1 Ohm, while the maximum value is set by the acceptable output voltage drop.

Due to the lower current, regulators VR2 and VR3 do not have special stability requirements. Typical 10µF ceramic capacitor ESR of 0.02 Ohm is sufficient for their stability.

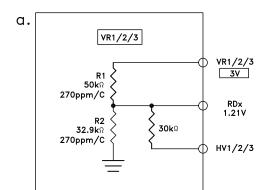

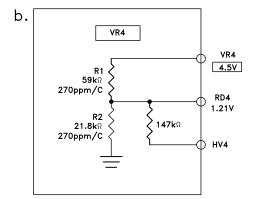

# **QUAD LOW NOISE HIGH PSRR** LINEAR VOLTAGE REGULATOR

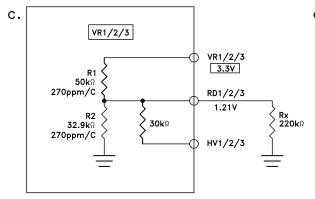

### **Output Voltage Adjust**

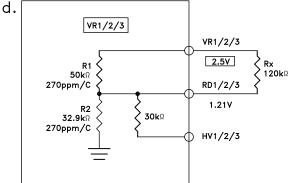

There are several ways to adjust the output voltage for each regulator. A 5V setting for any output can be achieved by grounding the respective HVx (x=1,2,3,4) pin. Any other value requires an external resistor, connected between RDx and GND for a voltage higher than the default, or between VRx and RDx for a voltage lower than the default. The figures below show the values of the internal resistive dividers that set the default output voltage a, for 3V and b, for 4.5V and two examples of two different voltage settings: c. shows a default 3V output changed to 3.3V by connecting a 220k Ohm resistor between RDx and GND, while d. shows the same output adjusted to 2.5V by connecting a 120k Ohm resistor between VRx and RDx.

The internal resistors have a temperature coefficient (TempCo) of +270ppm/°C. When the default output voltage is modified by using an external resistor with a different TempCo, the temperature behavior of the respective output will differ from this specification, although the difference will likely be very small.

$$VRX \approx VREF \times \left(1 + \frac{R1 \times (R2 + RX)}{(R2 \times RX)}\right)$$

For VRx > VRx\_default; X = 1, 2, 3, 4

VREF=1.21 Resistor values in  $K\Omega$ 

VRx\_default = 3V for VR1, VR2 & VR3

VRx\_default = 4.5V for VR4

$$VRX \approx VREF \times \left(1 + \frac{R1 \times RX}{R2 \times (R1 + RX)}\right)$$

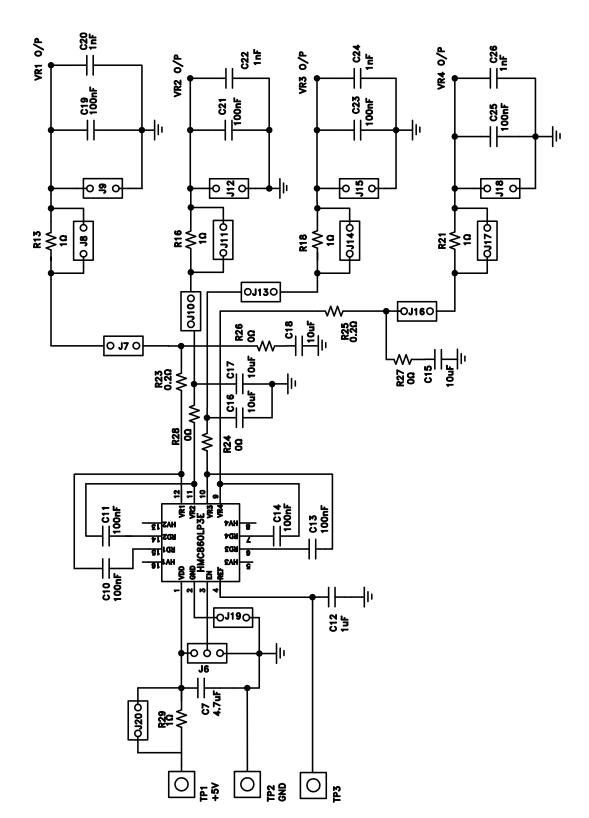

For VRx < VRx\_default;

X = 1, 2, 3, 4

VREF=1.21 Resistor values in KΩ
