Table 7. Diagnostic truth table

1. A cold lamp filament, or a capacitive load may activate the current limiting circuit of the IPS, when the IPS is initially turned on.

3.2 Input section

The input section is a high impedance differential stage with high common and differential mode range. Built-in offset of +1.4 V (typical value) and a hysteresis of 400 mV (maximum value) assure high noise immunity.

3.3 Diagnostic logic

The operating conditions of the device are permanently monitored and the following occurrences are indicated by DIAG1/DIAG2 open drain output pins:

- Short-circuit versus ground. A current limit circuit fixes I_{sc} = 3.2 A (typical value) the maximum current that can be sourced from the OUTPUT pin (for more details see Section 3.4: Short-circuit operation)
- Short-circuit versus V_s
- Undervoltage (UV)
- Overtemperature (OVT)
- Open load, if the output current is less than 3 mA (typical value)
- Output DMOS open according to Table 7

3.4 Short-circuit operation

In order to minimize the power dissipation when the output is shorted-to-ground, an innovative, non-dissipative short-circuit protection (patent pending) is implemented, avoiding the thermal protection.

Whenever the output is shorted-to-ground, or, an overcurrent is sinked by the load, the output devices are driven to linear mode, sourcing the I_{sc} current (3.2 A typ.) for a time interval (t_{ON}) defined by the external C_{ON} capacitor connected between the ON-DELAY pin and GND. If the short-circuit increases within the t_{ON} interval the DIAG2 output status is not affected, acting as a programmable diagnostic delay.

This function allows the device to drive a capacitive load or a filament lamp (that exhibits a very low resistance during the initial heading phase) without the diagnostic. If the short-circuit lasts for the whole t_{ON} interval, the output DMOS is switched off and the DIAG2 goes low, for a time interval t_{OFF} lasting t_{ON} 64 times.

At the end of the t_{OFF} interval if the short-circuit condition is still present, the output DMOS is turned on (and the DIAG2 goes high - see *Figure 7*) for another t_{ON} interval and the sequence starts again, otherwise, the normal condition operation is resumed.

The t_{ON} interval can be set to last between 64 ms and 2.56 ms for a C_{ON} capacitor value ranging between 50 pF and 2 nF:

Equation 1

If the ON-DELAY pin is grounded, the non-dissipative short-circuit protection is disabled and the I_{sc} current is delivered until the overtemperature protection shuts the device off. The behavior of the DIAG2 output is, in this situation, showed in *Table 7*.

3.5 **Overtemperature protection (OVT)**

If the chip temperature exceeds Θ_{lim} (measured in a central position in the chip) the chip deactivates itself.

The following actions are taken:

- the output stage is switched off
- the signal DIAG2 is activated (active low)

Normal operation is resumed as soon as (after some seconds) the chip temperature monitored goes back below $\Theta_{\text{lim}}\text{-}\Theta_{\text{th}}$.

The different thresholds with hysteretic behavior assure that any intermittent condition can be generated.

3.6 Undervoltage protection (UV)

The supply voltage is expected to range from 9.5 V to 35 V, even if its reference value is 24 V.

In this range, the device operates correctly. Below 9.5 V the overall system is not reliable.

Protection shuts off the output whenever the supply voltage falls below the mask fixed by V_{sth1} (9 V typ.) and V_{sth2} (8.5 V typ.).

The hysteresis (see *Figure 4*) assures a non-intermittent behavior at low supply voltage with a superimposed ripple. The undervoltage status is indicated by the DIAG1 and DIAG2 outputs (see *Table 7*).

3.7 Demagnetization of inductive loads

An internal Zener diode, limiting the voltage across the power MOSFET between 50 and 60 V (V_{cl}), provides safe and fast demagnetization of inductive loads without external clamping devices. The maximum energy that can be absorbed by an inductive load is specified in *Table 3*.

5 Revision history

Date	Revision	Changes
04-Oct-2011	1	Initial release.
24-Jan-2013	2	Changed the operating temperature range parameter in <i>Table 3</i> . Minor text changes.
06-Apr-2018	3	Updated <i>Table 3</i> (replaced E _i by E _{AS} symbol, updated parameter and value). Minor modifications throughout document.
