

LT1253/LT1254

ABSOLUTE MAXIMUM RATINGS

Total Supply Voltage (V^+ to V^-) 28V
 Input Current $\pm 15\text{mA}$
 Output Short-Circuit Duration (Note 1) Continuous
 Operating Temperature Range
 LT1253C, LT1254C 0°C to 70°C

Storage Temperature Range -65°C to 150°C
 Junction Temperature (Note 2) 150°C
 Lead Temperature (Soldering, 10 sec) 300°C

ELECTRICAL CHARACTERISTICS $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$, $V_S = \pm 5\text{V}$ to $\pm 12\text{V}$, unless otherwise noted.

Symbol	Parameter	CONDITIONS	MIN	TYP	MAX	UNITS
t_r	Small-Signal Rise Time	$V_S = \pm 12\text{V}$, $A_V = 2$		3.5		ns
	Rise and Fall Time	$V_S = \pm 5\text{V}$, $A_V = 2$, $V_{\text{OUT}} = 1\text{V}_{\text{P-P}}$		5.8		ns
t_p	Propagation Delay	$V_S = \pm 5\text{V}$, $A_V = 2$		3.5		ns

Note 1: A heat sink may be required to keep the junction temperature below absolute maximum when the output is shorted indefinitely.

Note 2: T_J is calculated from the ambient temperature T_A and power dissipation P_D according to the following formulas:

$$\text{LT1253CN8: } T_J = T_A + (P_D \times 100^{\circ}\text{C/W})$$

$$\text{LT1253CS8: } T_J = T_A + (P_D \times 150^{\circ}\text{C/W})$$

$$\text{LT1254CN: } T_J = T_A + (P_D \times 70^{\circ}\text{C/W})$$

$$\text{LT1254CS: } T_J = T_A + (P_D \times 100^{\circ}\text{C/W})$$

APPLICATIONS INFORMATION**Power Dissipation**

The LT1253/LT1254 amplifiers combine high speed and large output current drive into very small packages. Because these amplifiers work over a very wide supply range, it is possible to exceed the maximum junction temperature under certain conditions. To insure that the LT1253/LT1254 are used properly, we must calculate the worst case power dissipation, define the maximum ambient temperature, select the appropriate package and then calculate the maximum junction temperature.

The worst case amplifier power dissipation is the total of the quiescent current times the total power supply voltage plus the power in the IC due to the load. The quiescent supply current of the LT1253/LT1254 has a strong negative temperature coefficient. The supply current of each amplifier at 150°C is less than 7mA and typically is only 4.5mA. The power in the IC due to the load is a function of the output voltage, the supply voltage and load resistance. The worst case occurs when the output voltage is at half supply, if it can go that far, or its maximum value if it cannot reach half supply.

For example, let's calculate the worst case power dissipation in a video cable driver operating on a $\pm 12V$ supply that delivers a maximum of 2V into 150Ω .

$$P_{DMAX} = 2 \times V_S \times I_{SMAX} + (V_S - V_{OMAX}) \times V_{OMAX}/R_L$$

$$\begin{aligned} P_{DMAX} &= 2 \times 12V \times 7mA + (12V - 2V) \times 2V/150 \\ &= 0.168 + 0.133 = 0.301 \text{ Watt per Amp} \end{aligned}$$

Now if that is the dual LT1253, the total power in the package is twice that, or 0.602W. We now must calculate how much the die temperature will rise above the ambient. The total power dissipation times the thermal resistance of the package gives the amount of temperature rise. For the above example, if we use the S8 surface mount package, the thermal resistance is 150°C/W junction to ambient in still air.

$$\begin{aligned} \text{Temperature Rise} &= P_{DMAX} \times R_{\theta JA} = 0.602W \\ &\times 150^{\circ}\text{C}/\text{W} = 90.3^{\circ}\text{C} \end{aligned}$$

The maximum junction temperature allowed in the plastic package is 150°C. Therefore the maximum ambient allowed is the maximum junction temperature less the temperature rise.

$$\text{Maximum Ambient} = 150^{\circ}\text{C} - 90.3^{\circ}\text{C} = 59.7^{\circ}\text{C}$$

Note that this is less than the maximum of 70°C that is specified in the absolute maximum data listing. In order to use this package at the maximum ambient we must lower the supply voltage or reduce the output swing.

APPLICATIONS INFORMATION

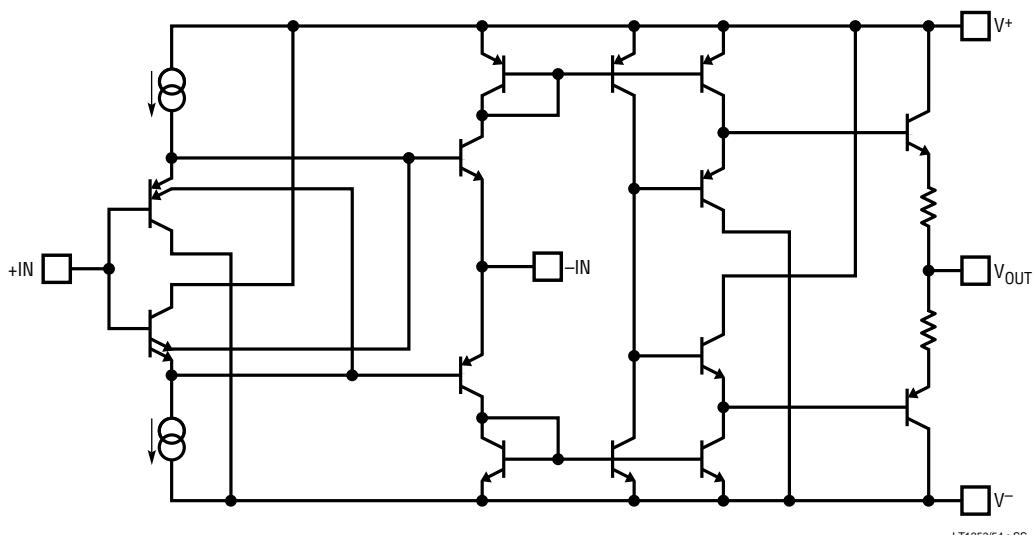

As a guideline to help in the selection of the LT1253/LT1254, the following table describes the maximum supply voltage that can be used with each part based on the following assumptions:

1. The maximum ambient is 70°C.
2. The load is a double-terminated video cable, 150Ω.
3. The maximum output voltage is 2V (peak or DC).

		MAX POWER at MAX TA
LT1253CN8	$V_S < \pm 14$ (Abs Max)	0.800W
LT1253CS8	$V_S < \pm 10.6$	0.533W
LT1254CN	$V_S < \pm 11.4$	1.143W
LT1254CS	$V_S < \pm 7.6$	0.727W
