T_{OUT}	$\pm 15\text{ V}$
R_{OUT}	$-0.3\text{ V to } (V_{CC} + 0.3\text{ V})$
Short-Circuit Duration	
T_{OUT}	Continuous
Package Information	
θ_{JA} , Thermal Impedance (LFCSP)	80°C/W
θ_{JA} , Thermal Impedance (QSOP)	149.97°C/W
Operating Temperature Range	
Industrial (A Version)	$-40^\circ\text{C to }+85^\circ\text{C}$
Storage Temperature Range	$-65^\circ\text{C to }+150^\circ\text{C}$
Pb-Free Temperature (Soldering, 10 sec)	260°C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

NOTES

1. EXPOSED PAD. THE EXPOSED PAD MUST BE CONNECTED TO GND. THIS CONNECTION IS NOT REQUIRED TO MEET ELECTRICAL PERFORMANCE.

Figure 2. LFCSP Pin Configuration

NC = NO CONNECT

Figure 3. QSOP Pin Configuration

Table 3. Pin Function Descriptions

Pin No. ¹		Mnemonic	Description
LFCSP	QSOP		
1, 12	2, 1	C1+, C1-	Positive and Negative Connections for Charge Pump Capacitor. External Capacitor C1 is connected between these pins; a 0.1 μ F capacitor is recommended, but larger capacitors up to 10 μ F can be used.
2	4	R _{OUT}	Receiver Output. This pin outputs CMOS output logic levels.
3	5	T _{IN}	Transmitter (Driver) Input. This input accepts TTL/CMOS levels.
4	7	V+	Internally Generated Positive Supply (+6 V Nominal).
5	8	V _{CC}	Power Supply Input, 3.0 V to 5.5 V.
6	9	GND	Ground. Must be connected to 0 V.
7	10	V-	Internally Generated Negative Supply (-6 V Nominal).
8	12	T _{OUT}	Transmitter (Driver) Output. This pin outputs RS-232 signal levels (typically ± 6 V).
9	13	R _{IN}	Receiver Input. This input accepts RS-232 signal levels. An internal 5 k Ω pull-down resistor to GND is connected on the input.
10, 11	15, 16	C2-, C2+	Positive and Negative Connections for Charge Pump Capacitor. External Capacitor C2 is connected between these pins; a 0.1 μ F capacitor is recommended, but larger capacitors up to 10 μ F can be used.
N/A	3, 6, 11, 14	NC	No Connect. These pins should always remain unconnected.
EPAD	N/A	EPAD	Exposed Pad. The exposed pad must be connected to GND. This connection is not required to meet electrical performance.

¹ N/A means not applicable.

THEORY OF OPERATION

The **ADM3101E** is a single-channel RS-232 line driver/receiver. Step-up voltage converters, coupled with level shifting transmitters and receivers, allow RS-232 levels to be developed while operating from a single 3.3 V supply.

CMOS technology is used to keep the power dissipation to an absolute minimum, allowing maximum battery life in portable applications.

CIRCUIT DESCRIPTION

The internal circuitry consists of the following main sections:

- A charge pump voltage converter
- A 3.3 V logic to an EIA/TIA-232E transmitter
- An EIA/TIA-232E to a 3.3 V logic receiver

Figure 12. Typical Operating Circuit

Charge Pump Voltage Converter

The charge pump voltage converter consists of a 200 kHz oscillator and a switching matrix. The converter generates a ± 6.6 V supply (when unloaded) from the 3.3 V input level. This is achieved in two stages by using a switched capacitor technique, as illustrated in Figure 13 and Figure 14. First, the 3.3 V input supply is doubled to +6.6 V by using C1 as the charge storage element. The +6.6 V level is then inverted to generate -6.6 V using C2 as the storage element. C3 is shown connected between V+ and VCC but is equally effective if connected between V+ and GND.

The C3 and C4 capacitors are used to reduce the output ripple. The values are not critical and can be increased, if desired. Larger capacitors (up to 10 μ F) can also be used in place of the C1, C2, C3, and C4 capacitors.

Figure 13. Charge Pump Voltage Doubler

Figure 14. Charge Pump Voltage Inverter

3.3 V Logic to EIA/TIA-232E Transmitter

The transmitter driver converts the 3.3 V logic input levels into RS-232 output levels. When driving an RS-232 load with $V_{CC} = 3.3$ V, the output voltage swing is typically ± 6 V. Internally, the T_{IN} pin has a weak pull-up that allows it to be driven by an open-drain output, but the maximum operating data rate is reduced when the T_{IN} pin is driven by an open-drain pin.

EIA/TIA-232E to 3.3 V Logic Receiver

The receiver is an inverting level shifter that accepts the RS-232 input level and translates it into a 3.3 V logic output level. The input has an internal 5 k Ω pull-down resistor to ground and is protected against overvoltages of up to ± 30 V. An unconnected input is pulled to 0 V by the internal 5 k Ω pull-down resistor, which, therefore, results in a Logic 1 output level for an unconnected input or for an input connected to GND.

The receiver has a Schmitt trigger input with a hysteresis level of 0.4 V, which ensures error-free reception for both a noisy input and for an input with slow transition times.

CMOS Input Voltage Thresholds

The CMOS input and output pins (T_{IN} and R_{OUT}) of the **ADM3101E** are designed to interface with 1.8 V logic thresholds when $V_{CC} = 3.3$ V.

The CMOS input and output pins (T_{IN} and R_{OUT}) of the **ADM3101E** are also designed to interface with TTL/CMOS logic thresholds when $V_{CC} = 5$ V.

ESD Protection on RS-232 and CMOS I/O Pins

All RS-232 (T_{OUT} and R_{IN}) and CMOS (T_{IN} and R_{OUT}) inputs and outputs are protected against electrostatic discharges (up to ± 15 kV).

HIGH BAUD RATE

The **ADM3101E** features high slew rates, permitting data transmission at rates well in excess of the EIA/RS-232 specifications. The RS-232 voltage levels are maintained at data rates of up to 460 kbps, even under worst-case loading conditions, when T_{IN} is driven by a push-pull output. The slew rate is internally controlled to less than 30 V/ μ s to minimize EMI interference.
