**Note 1:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

**Note 2:** The LT3460E/LT3460-1E is guaranteed to meet specifications from  $0^\circ\text{C}$  to  $70^\circ\text{C}$ . Specifications over the  $-40^\circ\text{C}$  to  $85^\circ\text{C}$  operating temperature range are assured by design, characterization and correlation with statistical process controls.

## PIN FUNCTIONS (ThinSOT/SC70/DFN Packages)

**SW (Pin 1/Pin 1/Pin 3):** Switch Pin. Connect inductor/diode here. Minimize trace at this pin to reduce EMI.

**GND (Pin 2/Pins 2 and 5/Exposed Pad Pin 7):** Ground Pin. Tie directly to local ground plane.

**FB (Pin 3/Pin 3/Pin 1):** Feedback Pin. Reference voltage is 1.255V. Connect resistor divider tap here. Minimize trace area at FB. Set  $V_{OUT}$  according to  $V_{OUT} = 1.255V (1 + R1/R2)$ .

**SHDN (Pin 4/Pin 4/Pin 6):** Shutdown Pin. Tie to 1.5V or higher to enable device; 0.4V or less to disable device. Also functions as soft-start. Use RC filter (47k, 47nF typ) as shown in Figure 1.

**V<sub>IN</sub> (Pin 5/Pin 6/Pin 4):** Input Supply Pin. Must be locally bypassed.

**NC (NA/NA/Pins 2, 5):** No-Connects. These pins are not connected to internal circuitry. They should be tied to ground to improve thermal and electrical performance.

## BLOCK DIAGRAM

3460 BD

Figure 1. Block Diagram, LT3460

## OPERATION

The LT3460/LT3460-1 uses a constant frequency, current mode control scheme to provide excellent line and load regulation. Operation can be best understood by referring to the block diagram in Figure 1. At the start of each oscillator cycle, the SR latch is set, which turns on the power switch Q1. A voltage proportional to the switch current is added to a stabilizing ramp and the resulting sum is fed into the positive terminal of the PWM comparator A2. When this voltage exceeds the level at the negative input of A2, the SR latch is reset turning off the power switch. The level at the negative input of A2 is set by the error amplifier A1, and is simply an amplified version of the difference between the feedback voltage and the reference voltage of 1.255V. In this manner, the error amplifier sets the correct peak current level to keep the output in regulation. If the error amplifier's output increases, more current is delivered to the output; if it decreases, less current is delivered.

### Feedback Loop Compensation

The LT3460/LT3460-1 has an internal feedback compensation network as shown in Figure 1 ( $R_C$  and  $C_C$ ). However, because the small signal characteristics of a boost converter change with operation conditions, the internal compensation network cannot satisfy all applications. A properly designed external feed forward capacitor from  $V_{OUT}$  to

FB ( $C_F$  in Figure 2) will correct the loop compensation for most applications.

The LT3460/LT3460-1 uses peak current mode control. The current feedback makes the inductor very similar to a current source in the medium frequency range. The power stage transfer function in the medium frequency range can be approximated as:

$$G_{P(s)} = \frac{K1}{s \cdot C2},$$

where  $C2$  is the output capacitance, and  $K1$  is a constant based on the operating point of the converter. In continuous current mode,  $K1$  increases as the duty cycle decreases.

The internal compensation network  $R_C$ ,  $C_C$  can be approximated as follows in medium frequency range:

$$G_{C(s)} = K2 \cdot \frac{s \cdot R_C \cdot C_C + 1}{s \cdot C_C}$$

The zero

$$f_z = \frac{1}{2 \cdot \pi \cdot R_C \cdot C_C}$$

is about 70kHz.

## OPERATION

**Figure 2. 5V to 12V Step-Up Converter**

The feedback loop gain  $T(s) = K3 \cdot G_P(s) \cdot G_C(s)$ . If it crosses over 0dB far before  $f_z$ , the phase margin will be small. Figure 3 is the Bode plot of the feedback loop gain measured from the converter shown in Figure 2 without the feedforward capacitor  $C_F$ . The result agrees with the previous discussion: Phase margin of about  $20^\circ$  is insufficient.

In order to improve the phase margin, a feed-forward capacitor  $C_F$  in Figure 2 can be used.

Without the feed-forward capacitor, the transfer function from  $V_{OUT}$  to FB is:

$$\frac{FB}{V_{OUT}} = \frac{R1}{R1+R2}$$

With the feed-forward capacitor  $C_F$ , the transfer function becomes:

$$\frac{FB}{V_{OUT}} = \frac{R1}{R1+R2} \cdot \frac{s \cdot R2 \cdot C_F + 1}{s \cdot \frac{R1 \cdot R2}{R1+R2} \cdot C_F + 1}$$

The feed-forward capacitor  $C_F$  generates a zero and a pole. The zero always appears before the pole. The frequency distance between the zero and the pole is determined only by the ratio between  $V_{OUT}$  and FB. To give maximum phase margin,  $C_F$  should be chosen so that the midpoint frequency between the zero and the pole is at the cross over frequency.

With  $C_F = 20pF$ , the feedback loop Bode plot is reshaped as shown in Figure 4. The phase margin is about  $60^\circ$ .

**Figure 3**

**Figure 4**

The feed-forward capacitor increases the gain at high frequency. The feedback loop therefore needs to have enough attenuation at the switching frequency to reject the switching noise. Additional internal compensation components have taken this into consideration.

For most of the applications of LT3460/LT3460-1, the output capacitor ESR zero is at very high frequency and can be ignored. If a low frequency ESR zero exists, for example, when a high-ESR Tantalum capacitor is used at the output, the phase margin may be enough even without a feed-forward capacitor. In these cases, the feed-forward capacitor should not be added because it may cause the feedback loop to not have enough attenuation at the switching frequency.

## OPERATION

### Layout Hints

The high speed operation of the LT3460/LT3460-1 demands careful attention to board layout. You will not get advertised performance with careless layout. Figure 5 shows the recommended component placement.

| LT3461/LT3461A   | 0.3A ( $I_{SW}$ ), 1.3MHz/3MHz, High Efficiency Step-Up DC/DC Converter with Integrated Schottky          | $V_{IN}$ : 2.5V to 16V, $V_{OUT(MAX)}$ = 38V, $I_Q$ = 2.8mA, $I_{SD}$ < 1μA, SC70, ThinSOT Packages |
| LT3464           | 0.08A ( $I_{SW}$ ), High Efficiency Step-Up DC/DC Converter with Integrated Schottky, Output Disconnect   | $V_{IN}$ : 2.3V to 10V, $V_{OUT(MAX)}$ = 34V, $I_Q$ = 25μA, $I_{SD}$ < 1μA, ThinSOT Package         |
| LT3465/LT3465A   | Constant Current, 1.2MHz/2.7MHz, High Efficiency White LED Boost Regulator with Integrated Schottky Diode | $V_{IN}$ : 2.7V to 16V, $V_{OUT(MAX)}$ = 30V, $I_Q$ = 1.9mA, $I_{SD}$ < 1μA, ThinSOT Package        |
