ABSOLUTE MAXIMUM RATINGS

(Note 1, 2 and 3)

Terminal Voltage

V_{CC} ..... –0.3V to 7.0V

$\overline{ST}$ and $\overline{RST}$ ..... –0.3V to 7.0V

All Other Inputs and Outputs ..... –0.3V to V_{CC} +0.3V

Power Dissipation 500mW

Operating Temperature Range

LTC1232C ..... 0°C to 70°C

LTC1232I ..... –40°C to 85°C

Storage Temperature Range ..... –65°C to 150°C

Lead Temperature (Soldering, 10 sec) ..... 300°C

C_{OUT}	Output Capacitance				5		pF

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: All voltage values are with respect to GND.

Note 3: The $\overline{PB\ RST}$ pin is internally pulled up to V_{CC} with an internal impedance of 10k typical. The TD pin has internal bias current.

Note 4: Measured with outputs open.

Note 5: The $\overline{RST}$ pin is an open drain output.

PIN FUNCTIONS

V_{CC}: 5V Supply Input. The V_{CC} pin should be bypassed with a 0.1µF capacitor.

GND: Ground Pin.

$\overline{\text{PB RST}}$: Logic Input to be Directly Connected to a Push-Button. The $\overline{\text{PB RST}}$ input requires an active low signal which is debounced and timed for a minimum of 40ms. When this condition is satisfied, the reset pulse generator forces the reset outputs to active states. The reset outputs remain in active states for a minimum of 250ms after $\overline{\text{PB RST}}$ is released from logic low level.

TOL: Input to Select 5% or 10% Variation on V_{CC}. When TOL is connected to GND, the reset pulse generator forces the reset outputs to active states as V_{CC} falls below 4.75V (4.62V typical). When TOL is connected to V_{CC}, the reset pulse generator forces the reset outputs to active states as V_{CC} falls below 4.5V (4.37V typical).

TD: Time-Out Delay. TD is a three-level input to select three different time-out periods. The time-out period is set by the TD input to be 150ms with TD connected to GND, 600ms with TD left floating, and 1.2 seconds with TD connected to V_{CC}.

PIN FUNCTIONS

$\overline{RST}$: Open Drain Logic Output for µP Reset Control. The LTC1232 provides three ways to generate µP reset. First, when V_{CC} falls below V_{CC} trip point (4.75V with TOL = GND and 4.5V with TOL = V_{CC}), $\overline{RST}$ goes active low. After V_{CC} returns to 5V, the reset pulse generator forces $\overline{RST}$ to remain active low for a minimum of 250ms. Second, when the watchdog timer is not serviced prior to a selected time-out period, the reset pulse generator also forces $\overline{RST}$ to active low for a minimum of 250ms and repeats for every time-out period. Third and the last, when the $\overline{PB\ RST}$ pin stays active low for a minimum of 40ms, $\overline{RST}$ becomes active low. The $\overline{RST}$ output will remain active low for a minimum of 250ms from the moment the push-button reset input is released from logic low level.

RST: RST is an Active High Logic Output. It is the inverse of $\overline{RST}$.

$\overline{ST}$: Logic Input to Reset the Watchdog Timer. Driving $\overline{ST}$ either high or low longer than the time-out period set by the TD input, forces the reset outputs to active states for a minimum of 250ms. The timer resets itself and begins to time-out again with each high to low transition on the $\overline{ST}$ input (see Figure 2).

APPLICATIONS INFORMATION

Power Monitoring

The LTC1232 uses a bandgap voltage reference and a precision voltage comparator, C1, to monitor the 5V supply input on V_{CC} (see Block Diagram). When V_{CC} falls below the V_{CC} trip point (4.62V typical with TOL = GND and 4.37V typical with TOL V_{CC}), the reset outputs are forced to active states. The V_{CC} trip point accounts for a 5% or 10% variation on V_{CC}, so the reset outputs become active when V_{CC} falls below the V_{CC} trip point. On power-up, the reset signals are held in active states for a minimum of 250ms after the V_{CC} trip point is reached to allow the power supply and microprocessor to stabilize. On power-down, the $\overline{RST}$ signal remains active low even with V_{CC} as low as 1V. This capability helps hold the microprocessor in stable shutdown condition. Figure 1 shows the timing diagram of the $\overline{RST}$ signal.

The precision voltage comparator, C1, typically has 40mV of hysteresis which ensures that glitches at V_{CC} pin do not activate the reset outputs. Response time is typically 10µs. To help prevent mitriggering due to transient loads, V_{CC} pin should be bypassed with a 0.1µF capacitor with the leads trimmed as short as possible.

Push-Button Reset

The LTC1232 provides a logic input pin, $\overline{PB\ RST}$, for direct connection to a push-button. This push-button reset input requires an active low signal. Internally, this input signal is debounced and timed for a minimum of 40ms. When this

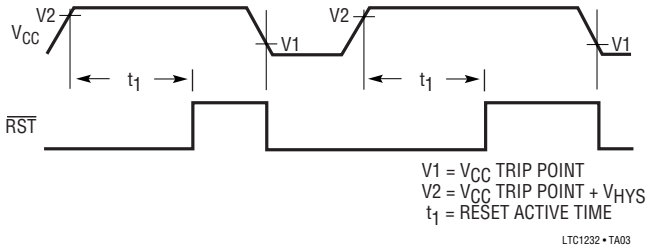

Figure 1. Reset Active Time

APPLICATIONS INFORMATION

condition is satisfied, the reset pulse generator forces the reset outputs to active states. The reset signals will remain active for a minimum of 250ms from the moment the push-button reset input is released from logic low level (see Timing Diagram).

Watchdog Timer

The LTC1232 provides a watchdog timer function to monitor the activity of the microprocessor. If the microprocessor does not stimulate the strobe input, $\overline{ST}$, within a selected time-out period, the reset outputs are forced to active states for a minimum of 250ms. The time-out period is selected by the Time-Out Delay input, TD, to be 150ms with TD connected to GND, 600ms with TD left floating, and 1.2 seconds with TD connected to V_{CC}. The 1.2 second time-out period is adequate for many systems to serve the watchdog timer immediately after a reset. Figure 2 shows the timing diagram of watchdog time-out period and reset active time. The watchdog time-out period is restarted as soon as the reset outputs are inactive. When a high-to-low transition occurs at the $\overline{ST}$ pin prior to time-out, the watchdog time is reset and begins to time-out again. To ensure the watchdog time does not time-out, a high-to low transition on the $\overline{ST}$ pin must occur at or less than the minimum time-out period. If the input to the $\overline{ST}$ pin remains either high or low, reset pulses will be issued for every time-out period selected by the TD pin. The watchdog timer is disabled when V_{CC} falls below the V_{CC} trip point.

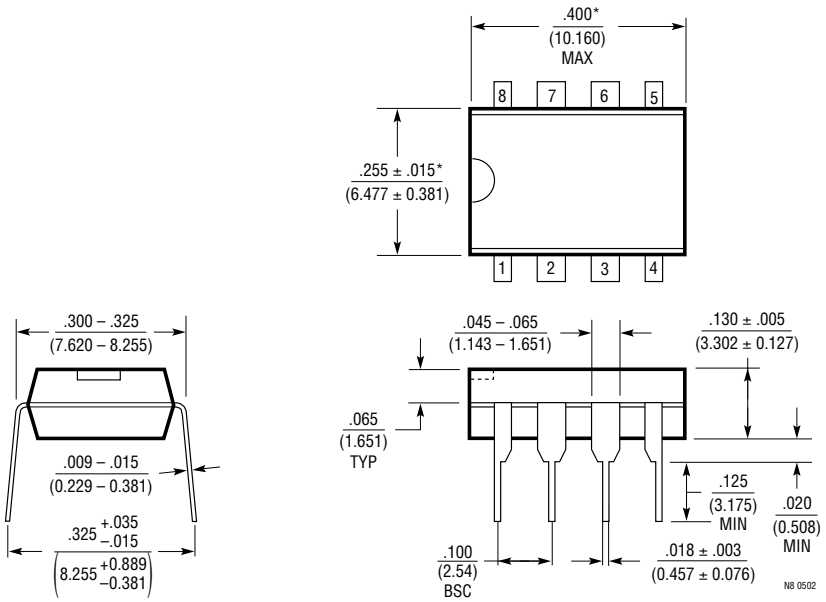
PACKAGE DESCRIPTION

N8 Package
8-Lead PDIP (Narrow .300 Inch)
(Reference LTC DWG # 05-08-1510)

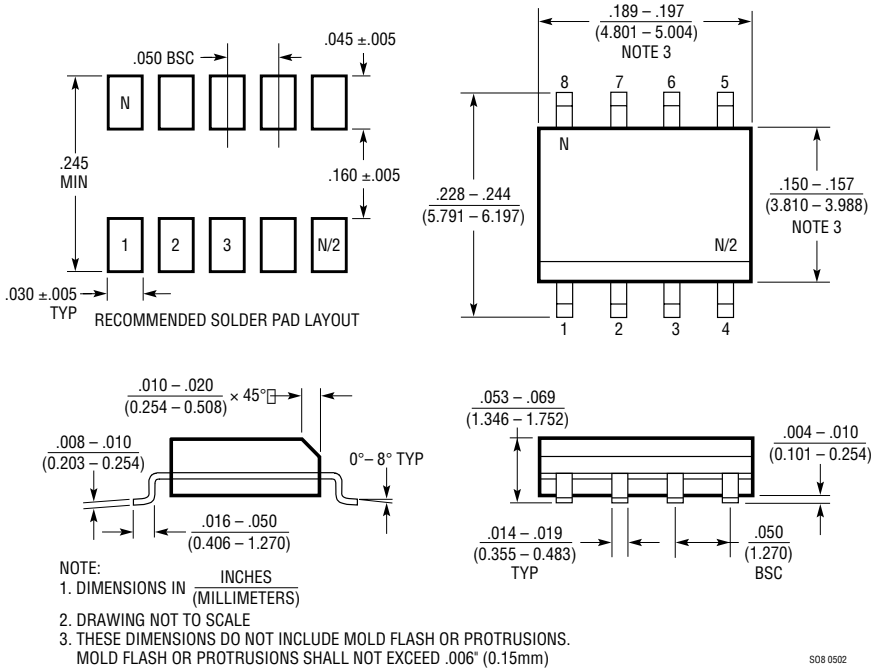


NOTE:
1. DIMENSIONS ARE $\frac{\text{INCHES}}{\text{MILLIMETERS}}$

*THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS.
MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .010 INCH (0.254mm)

PACKAGE DESCRIPTION

S8 Package
8-Lead Plastic Small Outline (Narrow .150 Inch)
(Reference LTC DWG # 05-08-1610)



NOTE:
1. DIMENSIONS IN INCHES (MILLIMETERS)
2. DRAWING NOT TO SCALE
3. THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS.
MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .006" (0.15mm)

S08 0502
