

# Low-Cost, Mono, 1.4W BTL Audio Power Amplifiers

## ABSOLUTE MAXIMUM RATINGS

Supply Voltage ( $V_{CC}$  to GND) .....-0.3V to +6V  
 Any Other Pin to GND .....-0.3V to ( $V_{CC} + 0.3V$ )  
 $I_{IN-}$ , BIAS,  $\overline{SHDN}$ ,  $\overline{BTL/SE}$  Continuous Current.....20mA  
 $I_{OUT-}$  Short-Circuit Duration to GND or  $V_{CC}$  (Note 1)...Continuous  
 Continuous Power Dissipation ( $T_A = +70^\circ\text{C}$ )  
     8-Pin TDFN (derate 24.4mW/ $^\circ\text{C}$  above  $+70^\circ\text{C}$ ) .....1951mW  
     8-Pin  $\mu\text{MAX}$  (derate 10.3mW/ $^\circ\text{C}$  above  $+70^\circ\text{C}$ ) .....825mW  
     9-Bump UCSP (derate 5.2mW/ $^\circ\text{C}$  above  $70^\circ\text{C}$ ).....412mW

Operating Temperature Range .....-40 $^\circ\text{C}$  to +85 $^\circ\text{C}$   
 Maximum Junction Temperature .....+150 $^\circ\text{C}$   
 Storage Temperature Range .....-65 $^\circ\text{C}$  to +150 $^\circ\text{C}$   
 Lead Temperature (soldering, 10s) .....+300 $^\circ\text{C}$   
 Soldering Temperature (reflow)  
     Lead(Pb)-Free Packages.....+260 $^\circ\text{C}$   
     Packages Containing Lead(Pb).....+240 $^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Input Resistance	$R_{IN}$	MAX9717B/C/D	12	20	28	$k\Omega$

**Note 1:** Continuous power dissipation must also be observed.

**Note 2:** All specifications are tested at  $T_A = +25^\circ C$ . Specifications over temperature ( $T_A = T_{MIN}$  to  $T_{MAX}$ ) are not production tested, and guaranteed by design.

**Note 3:** Quiescent power-supply current is specified and tested with no load. Quiescent power-supply current depends on the off-set voltage when a practical load is connected to the amplifier.

**Note 4:** Common-mode bias voltage is the voltage on  $BIAS$  and is nominally  $V_{CC}/2$ .

**Note 5:**  $V_{OS} = V_{OUT+} - V_{OUT-}$ .

**Note 6:** The amplifier input  $IN-$  is AC-coupled to  $GND$  through  $C_{IN}$ .

**Note 7:** Output power is specified by a combination of a functional output current test and characterization analysis.

**Note 8:** Measurement bandwidth for THD+N is 22Hz to 22kHz.

**Note 9:** Extended short-circuit conditions result in a pulsed output.

**Note 10:** Time for  $V_{OUT}$  to rise to 50% of final DC value.

MAX9716/MAX9717

## Detailed Description

The MAX9716/MAX9717 are 1.3W BTL speaker amplifiers. Both devices feature a low-power shutdown mode, and industry-leading click-and-pop suppression. The MAX9717 features a headphone sense input that disables the slave BTL amplifier to drive the headphone as a single-ended load. These devices consist of high output-current audio amps configured as BTL amplifiers (see *Functional Diagrams*). The closed-loop gain of the input op amp sets the single-ended gain of the device. Two external gain resistors set the gain of the MAX9716 and MAX9717A (see the *Gain-Setting Resistor* section). The MAX9717B/C/D feature internally set gains of 6dB, 9dB, and 12dB, respectively.

The output of the first amplifier serves as the input of the second amplifier, which is configured as an inverting unity-gain follower. This results in two outputs, identical in amplitude, but 180° out-of-phase.

### BIAS

The MAX9716/MAX9717 operate from a single 2.7V to 5.5V supply and feature an internally generated, common-mode bias voltage of V<sub>CC</sub>/2 referenced to ground. BIAS provides both click-and-pop suppression and sets the DC bias level for the audio outputs. The MAX9716 can be configured as a single-ended or differential input. For single-ended input, connect the noninverting input IN+ to BIAS externally. The MAX9717 BIAS is internally connected to the amplifier noninverting input IN+.

The MAX9717 can only be used with a

single-ended input. Always bypass BIAS to ground with a capacitor. Choose the value of the bypass capacitor as described in the *BIAS Capacitor* section. Do not connect external loads to BIAS. Any load lowers the BIAS voltage, affecting the overall performance of the device.

### $\overline{\text{BTL/SE}}$ Control Input

The MAX9717 features a headphone sense input,  $\overline{\text{BTL/SE}}$ , that enables headphone jack sensing to control the power amplifier output configuration. Driving  $\overline{\text{BTL/SE}}$  low enables the slave amplifier (OUT-). Driving  $\overline{\text{BTL/SE}}$  high disables the slave amplifier.

### Shutdown Mode

The MAX9716/MAX9717 feature a low-power shutdown mode that reduces quiescent current consumption to 10nA. Entering shutdown disables the bias circuitry, forces the amplifier outputs to GND through an internal 20kΩ resistor. Drive  $\overline{\text{SHDN}}$  low to enter shutdown mode; drive  $\overline{\text{SHDN}}$  high for normal operation.

### Click-and-Pop Suppression

The MAX9716/MAX9717 feature Maxim's industry-leading click-and-pop suppression circuitry. During startup, the amplifier common-mode bias voltage ramps to the DC bias. When entering shutdown, the amplifier outputs are pulled to GND through an internal 20kΩ resistor. This scheme minimizes the energy present in the audio band.

# Low-Cost, Mono, 1.4W BTL Audio Power Amplifiers

Figure 1. Bridge-Tied Load Configuration

## Applications Information

### BTL Amplifier

The MAX9716/MAX9717 are designed to drive a load differentially, a configuration referred to as bridge-tied load or BTL. The BTL configuration (Figure 1) offers advantages over the single-ended configuration, where one side of the load is connected to ground. Driving the load differentially doubles the output voltage compared to a single-ended amplifier under similar conditions. Thus, the differential gain of the device is twice the closed-loop gain of the input amplifier. The effective gain is given by:

$$A_V = 2 \times \frac{R_F}{R_{IN}}$$

Substituting  $2 \times V_{OUT(P-P)}$  for  $V_{OUT(P-P)}$  into the following equations yields four times the output power due to doubling of the output voltage:

$$V_{RMS} = \frac{V_{OUT(P-P)}}{2\sqrt{2}}$$

$$P_{OUT} = \frac{V_{RMS}^2}{R_L}$$

There is no net DC voltage across the load because the differential outputs are each biased at midsupply. This eliminates the need for DC-blocking capacitors required for single-ended amplifiers. These capacitors can be large and expensive, consume board space, and degrade low-frequency performance.

### Power Dissipation and Heat Sinking

Under normal operating conditions, the MAX9716/MAX9717 dissipate a significant amount of power. The maximum power dissipation for each package is given in the *Absolute Maximum Ratings* section under Continuous Power Dissipation or can be calculated by the following equation:

$$P_{DISSPKG(MAX)} = \frac{T_{J(MAX)} - T_A}{\theta_{JA}}$$

where  $T_{J(MAX)}$  is  $+150^{\circ}\text{C}$ ,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the reciprocal of the derating factor in  $^{\circ}\text{C/W}$  as specified in the *Absolute Maximum Ratings* section. For example,  $\theta_{JA}$  of the TDFN package is  $41^{\circ}\text{C/W}$ .

The increase in power delivered by the BTL configuration directly results in an increase in internal power dissipation over the single-ended configuration. The maximum power dissipation for a given  $V_{CC}$  and load is given by the following equation:

$$P_{DISS(MAX)} = \frac{2V_{CC}^2}{\pi^2 R_L}$$

If the power dissipation for a given application exceeds the maximum allowed for a given package, reduce power dissipation by increasing the ground plane heat-sinking capability and the size of the traces to the device (see the *Layout and Grounding* section). Other methods for reducing power dissipation are to reduce  $V_{CC}$ , increase load impedance, decrease ambient temperature, reduce gain, or reduce input signal.

Thermal-overload protection limits total power dissipation in the MAX9716/MAX9717. Thermal protection circuitry disables the amplifier output stage when the junction temperature exceeds  $+160^{\circ}\text{C}$ . The amplifiers are enabled once the junction temperature cools by  $15^{\circ}\text{C}$ . A pulsing output under continuous thermal-overload conditions results as the device heats and cools.

### Fixed Gain

The MAX9717B, MAX9717C, and MAX9717D feature internally fixed gains of 6dB, 9dB, and 12dB, respectively (see the *Selector Guide*). Fixed gain simplifies designs, reduces pin count, decreases required footprint size, and eliminates external gain-setting resistors. Resistors  $R_{IN}$  and  $R_F$  shown in the MAX9717B/C/D *Typical Operating Circuit* are used to achieve each fixed gain.

# Low-Cost, Mono, 1.4W BTL Audio Power Amplifiers

Figure 2. Setting the MAX9716/MAX9717A Gain

## Adjustable Gain Gain-Setting Resistors

External feedback resistors set the gain of the MAX9716 and MAX9717A. Resistors  $R_F$  and  $R_{IN}$  (see Figure 2) set the gain of the amplifier as follows:

$$A_V = 2 \left( \frac{R_F}{R_{IN}} \right)$$

Where  $A_V$  is the desired voltage gain. Hence, an  $R_{IN}$  of  $20k\Omega$  and an  $R_F$  of  $20k\Omega$  yields a gain of  $2V/V$ , or  $6dB$ .  $R_F$  can be either fixed or variable, allowing the use of a digitally controlled potentiometer to alter the gain under software control.

The gain of the MAX9717 in a single-ended output configuration is half the gain when configured as BTL output. Choose  $R_F$  between  $10k\Omega$  and  $50k\Omega$  for the MAX9716 and MAX9717A. Gains for the MAX9717B/C/D are set internally.

## Input Filter

$C_{IN}$  and  $R_{IN}$  form a highpass filter that removes the DC bias from an incoming signal. The AC-coupling capacitor allows the amplifier to bias the signal to an optimal DC level. Assuming zero-source impedance, the  $-3dB$  point of the highpass filter is:

$$f_{-3dB} = \frac{1}{2\pi R_{IN} C_{IN}}$$

Setting  $f_{-3dB}$  too high affects the low-frequency response of the amplifier. Use capacitors with dielectrics that have low-voltage coefficients, such as tantalum or aluminum electrolytic. Capacitors with high-voltage coefficients, such as ceramics, can increase distortion at low frequencies.

## Output-Coupling Capacitor

The MAX9717 require output-coupling capacitors to operate in single-ended (headphone) mode. The output-coupling capacitor blocks the DC component of the amplifier output, preventing DC current from flowing to the load. The output capacitor and the load impedance form a highpass filter with a  $-3dB$  point determined by:

$$f_{-3dB} = \frac{1}{2\pi R_L C_{OUT}}$$

As with the input capacitor, choose  $C_{OUT}$  such that  $f_{-3dB}$  is well below the lowest frequency of interest. Setting  $f_{-3dB}$  too high affects the amplifier's low-frequency response. Load impedance is a concern when choosing  $C_{OUT}$ . Load impedance can vary, changing the  $-3dB$  point of the output filter. A lower impedance increases the corner frequency, degrading low-frequency response. Select  $C_{OUT}$  such that the worst-case load/ $C_{OUT}$  combination yields an adequate response. Select capacitors with low ESR to minimize resistive losses and optimize power transfer to the load.

## Differential Input

The MAX9716 can be configured for a differential input. The advantage of differential inputs is that any common-mode noise is attenuated and not passed through the amplifier. This input improves noise rejection and provides common-mode rejection (Figure 3). External components should be closely matched for high CMRR. Figure 4 shows the MAX9716 configured for a differential input.

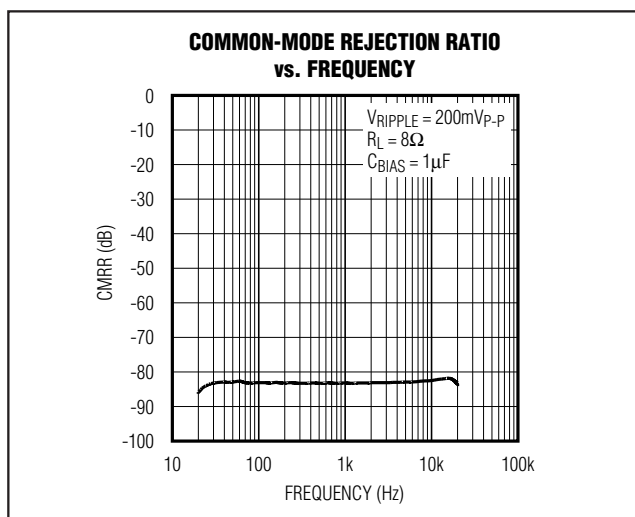

Figure 3. CMRR with Differential Input

# Low-Cost, Mono, 1.4W BTL Audio Power Amplifiers

Figure 4. MAX9716 Differential Input

## BIAS Capacitor

BIAS is the output of the internally-generated  $V_{CC}/2$  bias voltage. The BIAS bypass capacitor,  $C_{BIAS}$ , improves the power-supply rejection ratio by reducing power supply and other noise sources at the common-mode bias node.  $C_{BIAS}$  also generates the clickless/popless startup DC bias waveform for the speaker amplifiers. Bypass BIAS with a  $1\mu F$  capacitor to GND. Larger  $C_{BIAS}$  values improve PSRR but slow down  $t_{ON}$  time. Do not connect external loads to BIAS.

## Supply Bypassing

Proper power-supply bypassing ensures low-noise, low-distortion performance. Connect a  $1\mu F$  ceramic capacitor from  $V_{CC}$  to GND. Add additional bulk capacitance as required by the application. Connect the bypass capacitor as close to the device as possible.

## Layout and Grounding

Proper PC board layout and grounding is essential for optimizing performance. Use large traces for the power-supply inputs and amplifier outputs to minimize losses due to parasitic trace resistance. Large traces also aid in moving heat away from the package. Proper grounding improves audio performance and prevents digital switching noise from coupling into the audio signal.

The MAX9716/MAX9717 TDFN and  $\mu$ MAX packages feature exposed thermal pads on their undersides. This pad lowers the thermal resistance of the package by providing a direct-heat conduction path from the die to the printed circuit board. Connect the exposed pad to the ground plane using multiple vias, if required.

MAX9716/MAX9717

# Low-Cost, Mono, 1.4W BTL Audio Power Amplifiers

## Package Information (continued)

For the latest package outline information and land patterns (footprints), go to [www.maxim-ic.com/packages](http://www.maxim-ic.com/packages). Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

### NOTES:

1. ALL DIMENSIONS ARE IN mm. ANGLES IN DEGREES.
2. COPLANARITY SHALL NOT EXCEED 0.08 mm.
3. WARPAGE SHALL NOT EXCEED 0.10 mm.
4. PACKAGE LENGTH/PACKAGE WIDTH ARE CONSIDERED AS SPECIAL CHARACTERISTIC(S).
5. DRAWING CONFORMS TO JEDEC MO229, EXCEPT DIMENSIONS "D2" AND "E2", AND T1433-1 & T1433-2.
6. "N" IS THE TOTAL NUMBER OF LEADS.
7. NUMBER OF LEADS SHOWN ARE FOR REFERENCE ONLY.
8. MARKING IS FOR PACKAGE ORIENTATION REFERENCE ONLY.
9. ALL DIMENSIONS APPLY TO BOTH LEADED (-) AND PbFREE (+) PKG. CODES.

-DRAWING NOT TO SCALE-

		
TITLE: PACKAGE OUTLINE, 6,8,10 & 14L, TDFN, EXPOSED PAD, 3x3x0.80 mm		
APPROVAL	DOCUMENT CONTROL NO. 21-0137	REV. J 2/2
