# 74VHCT574A Octal D-Type Flip-Flop with 3-STATE Outputs

#### **General Description**

The VHCT574A is an advanced high speed CMOS octal flip-flop with 3-STATE output fabricated with silicon gate CMOS technology. It achieves the high speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation. This 8-bit D-type flip-flop is controlled by a clock input (CP) and an Output Enable input (OE). When the OE input is HIGH, the eight outputs are in a high impedance state.

Protection circuits ensure that 0V to 7V can be applied to the input and output (Note 1) pins without regard to the supply voltage. This device can be used to interface 3V to 5V systems and two supply systems such as battery back up. This circuit prevents device destruction due to mismatched supply and input voltages.

Note 1: Outputs in OFF-State.

#### Features

■ High speed: f<sub>MAX</sub> = 140 MHz (typ) at T<sub>A</sub> = 25°C

July 1997

Revised April 2005

- Power Down Protection is provided on all inputs and outputs.
- Low Noise: V<sub>OLP</sub> = 1.6V (max)
- Low Power Dissipation:
- I<sub>CC</sub> = 4 μA (max) @ T<sub>A</sub> = 25°C
- Pin and Function Compatible with 74HCT574

## **Functional Description**

The VHCT574A consists of eight edge-triggered flip-flops with individual D-type inputs and 3-STATE true outputs. The buffered clock and buffered Output Enable are common to all fip-flops. The eight flip-flops will store the state of their individual D inputs that meet the setup and hold time requirements on the LOW-to-HIGH Clock (CP) transition. With the Output Enable ( $\overline{\text{OE}}$ ) LOW, the contents of the eight flip-flops are available at the outputs. When the  $\overline{OE}$  is HIGH, the outputs go to the high impedance state. Operation of the OE input does not affect the state of the flipflops.

#### Absolute Maximum Ratings(Note 2)

Note 2: Absolute Maximum Ratings are values beyond which the device may be damaged or have its useful life impaired. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. Fairchild does not recommend operation outside databook specifications.

Note 3: HIGH or LOW state.  $\mathbf{I}_{\text{OUT}}$  absolute maximum rating must be observed.

Note 4: When outputs are in OFF-State or when  $V_{CC} = OV$ .

Note 5:  $V_{OUT} < GND, \, V_{OUT} > V_{CC}$  (Outputs Active).

Note 6: Unused inputs must be held HIGH or LOW. They may not float.

Note 8: Parameter guaranteed by design.  $t_{OSLH} = |t_{PLH max} - t_{PLH min}|; t_{OSHL} = |t_{PHL max} - t_{PHL min}|$ 

Note 9: CPD is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load. Average operating current can be obtained by the equation:  $I_{CC}$  (opr.) =  $C_{PD} * V_{CC} * f_{IN} + I_{CC}/8$  (per F/F). The total  $C_{PD}$  when n pcs. of the Octal D Flip-Flop operates can be calculated by the equation:  $C_{PD}$  (total) = 20 + 12n.
