2.2 32-lead VSOP (8 x 14 mm) or 32-lead TSOP, Type 1 (8 x 20 mm) – Top View

3. Block Diagram

4. Device Operation

4.1 Read

The AT49BV040A is accessed like an EPROM. When \overline{CE} and \overline{OE} are low and \overline{WE} is high, the data stored at the memory location determined by the address pins is asserted on the outputs. The outputs are put in the high impedance state whenever \overline{CE} or \overline{OE} is high. This dual-line control gives designers flexibility in preventing bus contention.

4.2 Command Sequences

When the device is first powered on it will be reset to the read or standby mode depending upon the state of the control line inputs. In order to perform other device functions, a series of command sequences are entered into the device. The command sequences are shown in the [“Command Definition Table” on page 6](#). The command sequences are written by applying a low pulse on the \overline{WE} or \overline{CE} input with \overline{CE} or \overline{WE} low (respectively) and \overline{OE} high. The address is latched on the falling edge of \overline{CE} or \overline{WE} (except for the sixth cycle of the Sector Erase command), whichever occurs last. The data is latched by the first rising edge of \overline{CE} or \overline{WE} . Standard microprocessor write timings are used. The address locations used in the command sequences are not affected by entering the command sequences.

4.3 Erasure

Before a byte can be reprogrammed, the main memory blocks or parameter blocks which contains the byte must be erased. The erased state of the memory bits is a logical “1”. The entire device can be erased at one time by using a 6-byte software code. The software chip erase code consists of 6-byte load commands to specific address locations with a specific data pattern (please refer to the Chip Erase Cycle Waveforms).

After the software chip erase has been initiated, the device will internally time the erase operation so that no external clocks are required. The maximum time needed to erase the whole chip is t_{EC} . If the boot block lockout feature has been enabled, the data in the boot sector will not be erased.

4.3.1 Chip Erase

If the boot block lockout has been enabled, the Chip Erase function will erase Parameter Block 1, Parameter Block 2, Main Memory Block 1 - 8, but not the boot block. If the Boot Block Lockout has not been enabled, the Chip Erase function will erase the entire chip. After the full chip erase the device will return back to read mode. Any command during chip erase will be ignored.

4.3.2 Sector Erase

As an alternative to a full chip erase, the device is organized into sectors that can be individually erased. There are two 8K-byte parameter block sections and eight main memory blocks. The 8K-byte parameter block sections and the eight main memory blocks can be independently erased and reprogrammed. The Sector Erase command is a six bus cycle operation. The sector address is latched on the rising \overline{WE} edge of the sixth cycle while the 30H data input command is also latched at the rising edge of \overline{WE} . The sector erase starts after the rising edge of \overline{WE} of the sixth cycle. The erase operation is internally controlled; it will automatically time to completion.

4.4 Byte Programming

Once the memory array is erased, the device is programmed (to a logical “0”) on a byte-by-byte basis. Please note that a data “0” cannot be programmed back to a “1”; only erase operations can convert “0”s to “1”s. Programming is accomplished via the internal device command register and is a 4 bus cycle operation (please refer to the [“Command Definition Table” on page 6](#)). The device will automatically generate the required internal program pulses.

The program cycle has addresses latched on the falling edge of \overline{WE} or \overline{CE} , whichever occurs last, and the data latched on the rising edge of \overline{WE} or \overline{CE} , whichever occurs first. Programming is completed after the specified t_{BP} cycle time. The \overline{DATA} polling feature may also be used to indicate the end of a program cycle.

4.5 Boot Block Programming Lockout

The device has one designated block that has a programming lockout feature. This feature prevents programming of data in the designated block once the feature has been enabled. The size of the block is 16K bytes. This block, referred to as the boot block, can contain secure code that is used to bring up the system. Enabling the lockout feature will allow the boot code to stay in the device while data in the rest of the device is updated. This feature does not have to be activated; the boot block's usage as a write protected region is optional to the user. The address range of the boot block is 00000 to 03FFF.

Once the feature is enabled, the data in the boot block can no longer be erased or programmed. Data in the main memory block can still be changed through the regular programming method. To activate the lockout feature, a series of six program commands to specific addresses with specific data must be performed. Please refer to the [“Command Definition Table” on page 6](#).

4.5.1 Boot Block Lockout Detection

A software method is available to determine if programming of the boot block section is locked out. When the device is in the software product identification mode (see [“Software Product Identification Entry and Exit”](#) sections) a read from address location 00002H will show if programming the boot block is locked out. If the data on I/O0 is low, the boot block can be programmed; if the data on I/O0 is high, the program lockout feature has been activated and the block cannot be programmed. The software product identification code should be used to return to standard operation.

4.6 Product Identification

The product identification mode identifies the device and manufacturer as Atmel. It may be accessed by hardware or software operation. The hardware operation mode can be used by an external programmer to identify the correct programming algorithm for the Atmel product.

For details, see Operating Modes (for hardware operation) or Software Product Identification. The manufacturer and device code is the same for both modes.

4.7 $\overline{\text{DATA}}$ Polling

The AT49BV040A features $\overline{\text{DATA}}$ polling to indicate the end of a program cycle. During a program cycle an attempted read of the last byte loaded will result in the complement of the loaded data on I/O7. Once the program cycle has been completed, true data is valid on all outputs and the next cycle may begin. $\overline{\text{DATA}}$ polling may begin at any time during the program cycle.

4.8 Toggle Bit

In addition to $\overline{\text{DATA}}$ polling the AT49BV040A provides another method for determining the end of a program or erase cycle. During a program or erase operation, successive attempts to read data from the device will result in I/O6 toggling between one and zero. Once the program cycle has completed, I/O6 will stop toggling and valid data will be read. Examining the toggle bit may begin at any time during a program cycle.

4.9 Hardware Data Protection

Hardware features protect against inadvertent programs to the AT49BV040A in the following ways: (a) V_{CC} sense: if V_{CC} is below 1.8V (typical), the program function is inhibited. (b) Program inhibit: holding any one of $\overline{\text{OE}}$ low, $\overline{\text{CE}}$ high or $\overline{\text{WE}}$ high inhibits program cycles. (c) Noise filter: pulses of less than 15 ns (typical) on the $\overline{\text{WE}}$ or $\overline{\text{CE}}$ inputs will not initiate a program cycle.

5. Command Definition Table

Command Sequence	Bus Cycles	1st Bus Cycle		2nd Bus Cycle		3rd Bus Cycle		4th Bus Cycle		5th Bus Cycle		6th Bus Cycle	
		Addr	Data	Addr	Data	Addr	Data	Addr	Data	Addr	Data	Addr	Data
Read	1	Addr	D _{OUT}										
Chip Erase	6	555	AA	AAA ⁽²⁾	55	555	80	555	AA	AAA	55	555	10
Sector Erase	6	555	AA	AAA	55	555	80	555	AA	AAA	55	SA ⁽⁵⁾	30
Byte Program	4	555	AA	AAA	55	555	A0	Addr	D _{IN}				
Boot Block Lockout ⁽³⁾	6	555	AA	AAA	55	555	80	555	AA	AAA	55	555	40
Product ID Entry	3	555	AA	AAA	55	555	90						
Product ID Exit ⁽⁴⁾	3	555	AA	AAA	55	555	F0						
Product ID Exit ⁽⁴⁾	1	XXX	F0										

- Notes:
- The DATA FORMAT in each bus cycle is as follows: I/O7 - I/O0 (Hex). The address format in each bus cycle is as follows: A11 - A0 (Hex); A11 - A18 (don't care).
 - Since A11 is don't care, AAA can be replaced with 2AA.
 - The 16K byte boot sector has the address range 00000H to 03FFFH.
 - Either one of the Product ID Exit commands can be used.
 - SA = sector addresses:
 SA = 00000 to 03FFF for BOOT BLOCK
 SA = 04000 to 05FFF for PARAMETER BLOCK 1
 SA = 06000 to 07FFF for PARAMETER BLOCK 2
 SA = 08000 to FFFF for MAIN MEMORY ARRAY BLOCK 1
 SA = 10000 to 1FFFF for MAIN MEMORY ARRAY BLOCK 2
 SA = 20000 to 2FFFF for MAIN MEMORY ARRAY BLOCK 3
 SA = 30000 to 3FFFF for MAIN MEMORY ARRAY BLOCK 4
 SA = 40000 to 4FFFF for MAIN MEMORY ARRAY BLOCK 5
 SA = 50000 to 5FFFF for MAIN MEMORY ARRAY BLOCK 6
 SA = 60000 to 6FFFF for MAIN MEMORY ARRAY BLOCK 7
 SA = 70000 to 7FFFF for MAIN MEMORY ARRAY BLOCK 8

6. Absolute Maximum Ratings

Temperature Under Bias.....	-55°C to +125°C
Storage Temperature	-65°C to +150°C
All Input Voltages (including NC Pins) with Respect to Ground	-0.6V to +6.25V
All Output Voltages with Respect to Ground	-0.6V to V _{CC} + 0.6V
Voltage on \overline{OE} with Respect to Ground	-0.6V to +13.5V

*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

7. DC and AC Operating Range

		AT49BV040A-70	AT49BV040A-90
Operating Temperature (Case)	Ind.	-40°C - 85°C	-40°C - 85°C
V _{CC} Power Supply		2.7V - 3.6V	2.7V - 3.6V

8. Operating Modes

Mode	\overline{CE}	\overline{OE}	\overline{WE}	Ai	I/O
Read	V _{IL}	V _{IL}	V _{IH}	Ai	D _{OUT}
Program/Erase ⁽²⁾	V _{IL}	V _{IH}	V _{IL}	Ai	D _{IN}
Standby/Write Inhibit	V _{IH}	X ⁽¹⁾	X	X	High Z
Program Inhibit	X	X	V _{IH}		
Program Inhibit	X	V _{IL}	X		
Output Disable	X	V _{IH}	X		High Z
Reset	X	X	X	X	High Z
Product Identification					
Hardware	V _{IL}	V _{IL}	V _{IH}	A1 - A18 = V _{IL} , A9 = V _H ⁽³⁾ , A0 = V _{IL}	Manufacturer Code ⁽⁴⁾
				A1 - A18 = V _{IL} , A9 = V _H ⁽³⁾ , A0 = V _{IH}	Device Code ⁽⁴⁾
Software ⁽⁵⁾				A0 = V _{IL} , A1 - A18 = V _{IL}	Manufacturer Code ⁽⁴⁾
				A0 = V _{IH} , A1 - A18 = V _{IL}	Device Code ⁽⁴⁾

- Notes:
1. X can be V_{IL} or V_{IH}.
 2. Refer to AC Programming Waveforms.
 3. V_H = 12.0V ± 0.5V.
 4. Manufacturer Code: 1FH, Device Code: 13H.
 5. See details under "Software Product Identification Entry/Exit".

9. DC Characteristics

Symbol	Parameter	Condition	Min	Max	Units
I _{LI}	Input Load Current	V _{IN} = 0V to V _{CC}		10	μA
I _{LO}	Output Leakage Current	V _{I/O} = 0V to V _{CC}		10	μA
I _{SB1}	V _{CC} Standby Current CMOS	\overline{CE} = V _{CC} - 0.3V to V _{CC}		50	μA
I _{SB2}	V _{CC} Standby Current TTL	\overline{CE} = 2.0V to V _{CC}		1	mA
I _{CC} ⁽¹⁾	V _{CC} Active Current	f = 5 MHz; I _{OUT} = 0 mA		15	mA
V _{IL}	Input Low Voltage			0.6	V
V _{IH}	Input High Voltage		2.0		V
V _{OL}	Output Low Voltage	I _{OL} = 2.1 mA		0.45	V
V _{OH}	Output High Voltage	I _{OH} = -400 μA	2.4		V

- Note:
1. In the erase mode, I_{CC} is 70 mA.

10. AC Read Characteristics

Symbol	Parameter	AT49BV040A-70		AT49BV040A-90		Units
		Min	Max	Min	Max	
t_{ACC}	Address to Output Delay		70		90	ns
$t_{CE}^{(1)}$	\overline{CE} to Output Delay		70		90	ns
$t_{OE}^{(2)}$	\overline{OE} to Output Delay	0	35	0	40	ns
$t_{DF}^{(3)(4)}$	\overline{CE} or \overline{OE} to Output Float	0	25	0	25	ns
t_{OH}	Output Hold from \overline{OE} , \overline{CE} or Address, whichever occurred first	0		0		ns

11. AC Read Waveforms ⁽¹⁾⁽²⁾⁽³⁾⁽⁴⁾

- Notes:
- \overline{CE} may be delayed up to $t_{ACC} - t_{CE}$ after the address transition without impact on t_{ACC} .
 - \overline{OE} may be delayed up to $t_{CE} - t_{OE}$ after the falling edge of \overline{CE} without impact on t_{CE} or by $t_{ACC} - t_{OE}$ after an address change without impact on t_{ACC} .
 - t_{DF} is specified from \overline{OE} or \overline{CE} whichever occurs first (CL = 5 pF).
 - This parameter is characterized and is not 100% tested.

12. Input Test Waveform and Measurement Level

13. Output Load Test

14. Pin Capacitance

$f = 1 \text{ MHz}$, $T = 25^\circ\text{C}^{(1)}$

Symbol	Typ	Max	Units	Conditions
C_{IN}	4	6	pF	$V_{IN} = 0V$
C_{OUT}	8	12	pF	$V_{OUT} = 0V$

Note: 1. This parameter is characterized and is not 100% tested.

15. AC Byte Load Characteristics

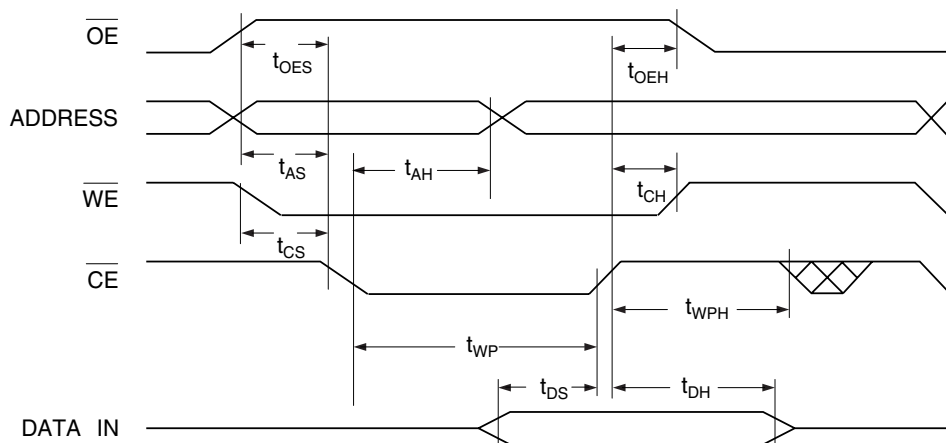

Symbol	Parameter	Min	Max	Units
t_{AS}, t_{OES}	Address, \overline{OE} Set-up Time	0		ns
t_{AH}	Address Hold Time	40		ns
t_{CS}	Chip Select Set-up Time	0		ns
t_{CH}	Chip Select Hold Time	0		ns
t_{WP}	Write Pulse Width (\overline{WE} or \overline{CE})	30		ns
t_{DS}	Data Set-up Time	40		ns
t_{DH}, t_{OEH}	Data, \overline{OE} Hold Time	0		ns
t_{WPH}	Write Pulse Width High	30		ns

16. AC Byte Load Waveforms

16.1 \overline{WE} Controlled

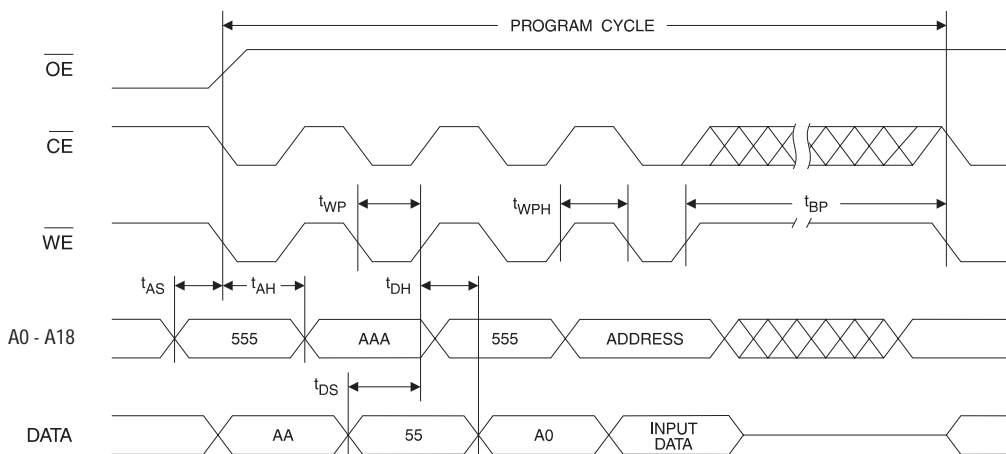

16.2 \overline{CE} Controlled

17. Program Cycle Characteristics

Symbol	Parameter	Min	Typ	Max	Units
t_{BP}	Byte Programming Time		30	50	μs
t_{AS}	Address Set-up Time	0			ns
t_{AH}	Address Hold Time	40			ns
t_{DS}	Data Set-up Time	40			ns
t_{DH}	Data Hold Time	0			ns
t_{WP}	Write Pulse Width	30			ns
t_{WPH}	Write Pulse Width High	30			ns
t_{EC}	Chip Erase Cycle Time			12	seconds

18. Program Cycle Waveforms

19. Sector or Chip Erase Cycle Waveforms

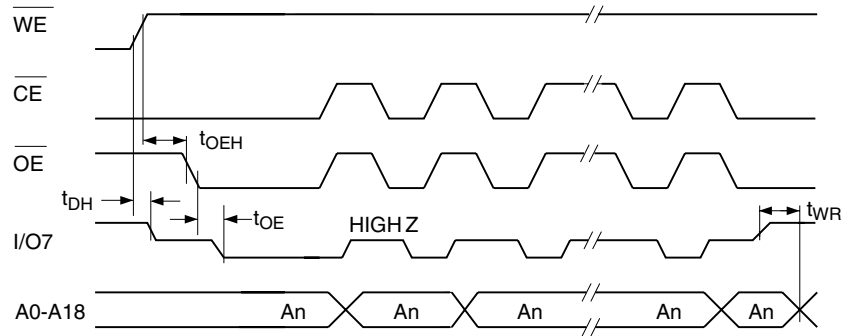

- Notes:
- \overline{OE} must be high only when \overline{WE} and \overline{CE} are both low.
 - For chip erase, the address should be 555. For sector erase, the address depends on what sector is to be erased. (See note 4 under "Command Definition Table" on page 6.)
 - For chip erase, the data should be 10H, and for sector erase, the data should be 30H.

20. Data Polling Characteristics

Symbol	Parameter	Min	Typ	Max	Units
t_{DH}	Data Hold Time	10			ns
$t_{OE\overline{H}}$	\overline{OE} Hold Time	10			ns
t_{OE}	\overline{OE} to Output Delay ⁽²⁾				ns
t_{WR}	Write Recovery Time	0			ns

Notes: 1. These parameters are characterized and not 100% tested.
2. See t_{OE} spec in "AC Read Characteristics" on page 8.

21. Data Polling Waveforms

22. Toggle Bit Characteristics

Symbol	Parameter	Min	Typ	Max	Units
t_{DH}	Data Hold Time	10			ns
$t_{OE\overline{H}}$	\overline{OE} Hold Time	10			ns
t_{OE}	\overline{OE} to Output Delay ⁽²⁾				ns
t_{OEHP}	\overline{OE} High Pulse	50			ns
t_{WR}	Write Recovery Time	0			ns

Notes: 1. These parameters are characterized and not 100% tested.
2. See t_{OE} spec in "AC Read Characteristics" on page 8.

23. Toggle Bit Waveforms⁽¹⁾⁽²⁾⁽³⁾

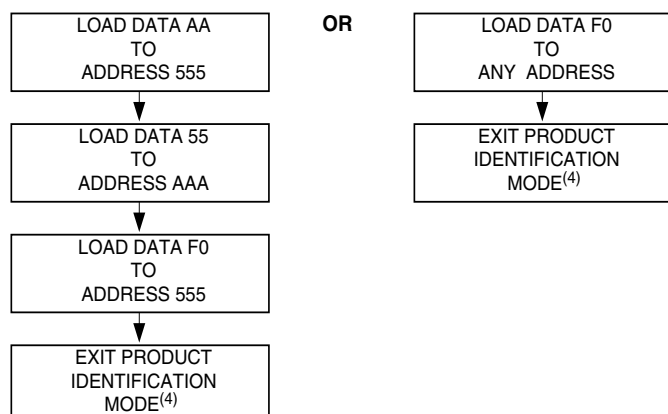

Notes: 1. Toggling either \overline{OE} or \overline{CE} or both \overline{OE} and \overline{CE} will operate toggle bit. The t_{OEHP} specification must be met by the toggling input(s).
2. Beginning and ending state of I/O6 will vary.
3. Any address location may be used but the address should not vary.

24. Software Product Identification Entry⁽¹⁾

25. Software Product Identification Exit⁽¹⁾

26. Boot Block Lockout Feature Enable Algorithm⁽¹⁾

- Notes:
1. Data Format: I/O7 - I/O0 (Hex); Address Format: A11 - A0 (Hex).
 2. Boot block lockout feature enabled.

- Notes:
1. Data Format: I/O7 - I/O0 (Hex); Address Format: A11 - A0 (Hex).
 2. A1 - A18 = V_{IL} .
Manufacture Code is read for A0 = V_{IL} ;
Device Code is read for A0 = V_{IH} .
Additional Device Code is read for address 0003H
 3. The device does not remain in identification mode if powered down.
 4. The device returns to standard operation mode.
 5. Manufacturer Code: 1FH
Device Code: 13H.
Additional Device Code: 0FH.

27. Ordering Information

27.1 Standard Package

t_{ACC} (ns)	I_{CC} (mA)		Ordering Code	Package	Operation Range
	Active	Standby			
70	15	0.05	AT49BV040A-70JI AT49BV040A-70TI AT49BV040A-70VI	32J 32T 32V	Industrial (-40° to 85°C)
