Left Port	Right Port	Description
$I/O_{0L-7L(8L)}$	$I/O_{0R-7R(8R)}$	Data bus input/output
A_{0L-12L}	A_{0R-12R}	Address lines
\overline{CE}_L	\overline{CE}_R	Chip enable
\overline{OE}_L	\overline{OE}_R	Output enable
R/\overline{W}_L	R/\overline{W}_R	Read/Write enable
\overline{SEM}_L	\overline{SEM}_R	Semaphore enable. When asserted LOW, allows access to eight semaphores. The three least significant bits of the address lines will determine which semaphore to write or read. The I/O_0 pin is used when writing to a semaphore. Semaphores are requested by writing a 0 into the respective location.
\overline{INT}_L	\overline{INT}_R	Interrupt Flag. \overline{INT}_L is set when right port writes location 1FFE and is cleared when left port reads location 1FFE. \overline{INT}_R is set when left port writes location 1FFF and is cleared when right port reads location 1FFF.
\overline{BUSY}_L	\overline{BUSY}_R	Busy flag
M/\overline{S}		Master or Slave select
V_{CC}		Power
GND		Ground

Architecture

The CY7C144/5 consists of an array of 8 K words of 8/9 bits each of dual-port RAM cells, I/O and address lines, and control signals (\overline{CE} , \overline{OE} , R/W). These control pins permit independent access for reads or writes to any location in memory. To handle simultaneous writes or reads to the same location, a \overline{BUSY} pin is provided on each port. Two interrupt (INT) pins can be used for port-to-port communication. Two semaphore (SEM) control pins are used for allocating shared resources. With the M/S pin, the CY7C144/5 can function as a Master (\overline{BUSY} pins are outputs) or as a slave (\overline{BUSY} pins are inputs). The CY7C144/5 has an automatic power down feature controlled by \overline{CE} . Each port is provided with its own output enable control (\overline{OE}), which allows data to be read from the device.

Functional Description

Write Operation

Data must be set up for a duration of t_{SD} before the rising edge of R/W to guarantee a valid write. A write operation is controlled by either the \overline{OE} pin (see Figure 8 on page 12) or the R/W pin (see Write Cycle No. 2 waveform). Data can be written to the device t_{HZOE} after the \overline{OE} is deasserted or t_{HZWE} after the falling edge of R/W. Required inputs for non-contention operations are summarized in Table 3.

If a location is being written to by one port and the opposite port attempts to read that location, a port-to-port flowthrough delay must be met before the data is read on the output; otherwise the data read is not deterministic. Data will be valid on the port t_{DD} after the data is presented on the other port.

Read Operation

When reading the device, the user must assert both the \overline{OE} and \overline{CE} pins. Data will be available t_{ACE} after \overline{CE} or t_{DOE} after \overline{OE} are asserted. If the user of the CY7C144/5 wishes to access a semaphore flag, then the SEM pin must be asserted instead of the \overline{CE} pin.

Interrupts

The interrupt flag (\overline{INT}) permits communications between ports. When the left port writes to location 1FFF, the right port's interrupt flag (\overline{INT}_R) is set. This flag is cleared when the right port reads that same location. Setting the left port's interrupt flag (\overline{INT}_L) is accomplished when the right port writes to location 1FFE. This flag is cleared when the left port reads location 1FFE. The message at 1FFF or 1FFE is user-defined. See Table 4 for input requirements for INT. \overline{INT}_R and \overline{INT}_L are push-pull outputs and do not require pull-up resistors to operate.

Busy

The CY7C144/5 provides on-chip arbitration to alleviate simultaneous memory location access (contention). If both ports' \overline{CE} s are asserted and an address match occurs within t_{PS} of each other the Busy logic determines which port has access. If t_{PS} is violated, one port will definitely gain permission to the location, but it is not guaranteed which one. \overline{BUSY} will be asserted t_{BLA} after an address match or t_{BLC} after \overline{CE} is taken LOW. \overline{BUSY}_L and \overline{BUSY}_R in master mode are push-pull outputs and do not require pull-up resistors to operate.

Master/Slave

An M/S pin is provided in order to expand the word width by configuring the device as either a master or a slave. The \overline{BUSY} output of the master is connected to the \overline{BUSY} input of the slave. This enables the device to interface to a master device with no external components. Writing of slave devices must be delayed until after the \overline{BUSY} input has settled. Otherwise, the slave chip may begin a write cycle during a contention situation. When presented a HIGH input, the M/S pin allows the device to be used as a master and therefore the \overline{BUSY} line is an output. \overline{BUSY} can then be used to send the arbitration outcome to a slave.

Semaphore Operation

The CY7C144/5 provides eight semaphore latches which are separate from the dual-port memory locations. Semaphores are used to reserve resources that are shared between the two ports. The state of the semaphore indicates that a resource is in use. For example, if the left port wants to request a given resource, it sets a latch by writing a 0 to a semaphore location. The left port then verifies its success in setting the latch by reading it. After writing to the semaphore, SEM or \overline{OE} must be deasserted for t_{SOP} before attempting to read the semaphore. The semaphore value is available $t_{SWRD} + t_{DOE}$ after the rising edge of the semaphore write. If the left port was successful (reads a 0), it assumes control over the shared resource, otherwise (reads a 1) it assumes the right port has control and continues to poll the semaphore. When the right side has relinquished control of the semaphore (by writing a 1), the left side will succeed in gaining control of the semaphore. If the left side no longer requires the semaphore, a 1 is written to cancel its request.

Semaphores are accessed by asserting SEM LOW. The SEM pin functions as a chip enable for the semaphore latches (\overline{CE} must remain HIGH during SEM LOW). A_{0-2} represents the semaphore address. \overline{OE} and R/W are used in the same manner as a normal memory access. When writing or reading a semaphore, the other address pins have no effect.

When writing to the semaphore, only I/O₀ is used. If a 0 is written to the left port of an unused semaphore, a 1 appears at the same semaphore address on the right port. That semaphore can now only be modified by the side showing 0 (the left port in this case). If the left port now relinquishes control by writing a 1 to the semaphore, the semaphore will be set to 1 for both sides. However, if the right port had requested the semaphore (written a 0) while the left port had control, the right port would immediately own the semaphore as soon as the left port released it. Table 5 shows sample semaphore operations.

When reading a semaphore, all eight/nine data lines output the semaphore value. The read value is latched in an output register to prevent the semaphore from changing state during a write from the other port. If both ports attempt to access the semaphore within t_{SPS} of each other, the semaphore is definitely obtained by one side or the other, but there is no guarantee which side controls the semaphore.

Initialization of the semaphore is not automatic and must be reset during initialization program at power-up. All Semaphores on both sides should have a one written into them at initialization from both sides to assure that they are free when needed.

Table 3. Non-Contending Read/Write

Inputs				Outputs	Operation
CE	R/W	OE	SEM	I/O _{0-7/8}	
H	X	X	H	High Z	Power-down
H	H	L	L	Data out	Read data in semaphore
X	X	H	X	High Z	I/O lines disabled
H		X	L	Data in	Write to semaphore
L	H	L	H	Data out	Read
L	L	X	H	Data in	Write
L	X	X	L		Illegal condition

Table 4. Interrupt Operation Example (assumes $\overline{\text{BUSY}}_L = \overline{\text{BUSY}}_R = \text{HIGH}$)

Function	Left Port					Right Port				
	R/W	CE	OE	A ₀₋₁₂	INT	R/W	CE	OE	A ₀₋₁₂	INT
Set left $\overline{\text{INT}}$	X	X	X	X	L	L	L	X	1FFE	X
Reset left $\overline{\text{INT}}$	X	L	L	1FFE	H	X	L	L	X	X
Set right $\overline{\text{INT}}$	L	L	X	1FFF	X	X	X	X	X	L
Reset right $\overline{\text{INT}}$	X	X	X	X	X	X	L	L	1FFF	H

Table 5. Semaphore Operation Example

Function	I/O _{0-7/8} Left	I/O _{0-7/8} Right	Status
No action	1	1	Semaphore free
Left port writes semaphore	0	1	Left port obtains semaphore
Right port writes 0 to semaphore	0	1	Right side is denied access
Left port writes 1 to semaphore	1	0	Right port is granted access to semaphore
Left port writes 0 to semaphore	1	0	No change. Left port is denied access
Right port writes 1 to semaphore	0	1	Left port obtains semaphore
Left port writes 1 to semaphore	1	1	No port accessing semaphore address
Right port writes 0 to semaphore	1	0	Right port obtains semaphore
Right port writes 1 to semaphore	1	1	No port accessing semaphore
Left port writes 0 to semaphore	0	1	Left port obtains semaphore
Left port writes 1 to semaphore	1	1	No port accessing semaphore

Maximum Ratings

Exceeding maximum ratings may impair the useful life of the device. These user guidelines are not tested.^[3]

Storage temperature -65 °C to +150 °C

Ambient temperature with power applied..... -55 °C to +125 °C

Supply voltage to ground potential -0.5 V to +7.0 V

DC voltage applied to outputs in High Z state..... -0.5 V to +7.0 V

DC input voltage^[4] -0.5 V to +7.0 V

Output current into outputs (LOW) 20 mA

Static discharge voltage..... >2001 V (per MIL-STD-883, Method 3015)

Latch-up current >200 mA

Operating Range

Range	Ambient Temperature	V _{CC}
Commercial	0 °C to +70 °C	5 V ± 10%
Industrial	-40 °C to +85 °C	5 V ± 10%

			Industrial	—	—	—	115	

Notes

3. The Voltage on any input or I/O pin cannot exceed the power pin during power-up.

4. Pulse width < 20 ns.

5. f_{MAX} = 1/t_{RC} = All inputs cycling at f = 1/t_{RC} (except output enable). f = 0 means no address or control lines change. This applies only to inputs at CMOS level standby I_{SB3}

Note

12. Test conditions used are Load 2.

Switching Waveforms

Figure 5. Read Cycle No. 1 (Either Port Address Access)^[13, 14]

Figure 6. Read Cycle No. 2 (Either Port $\overline{CE}/\overline{OE}$ Access)^[13, 15, 16]

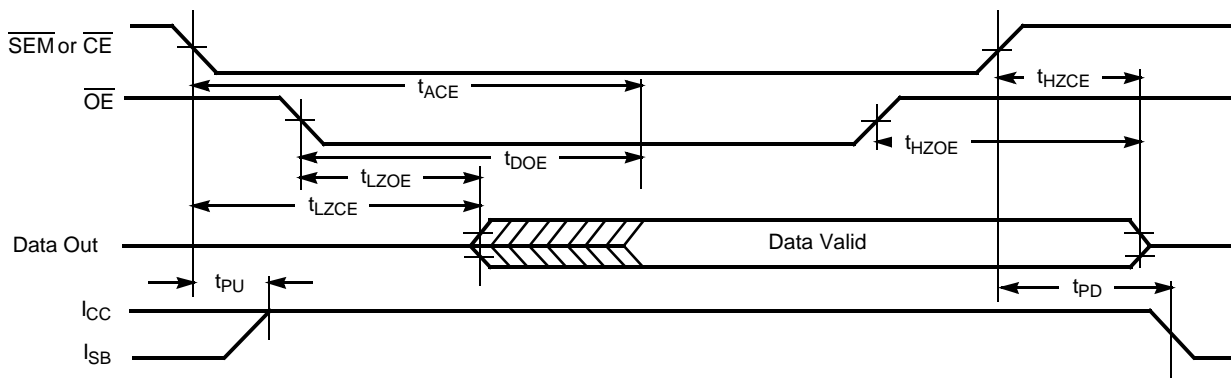

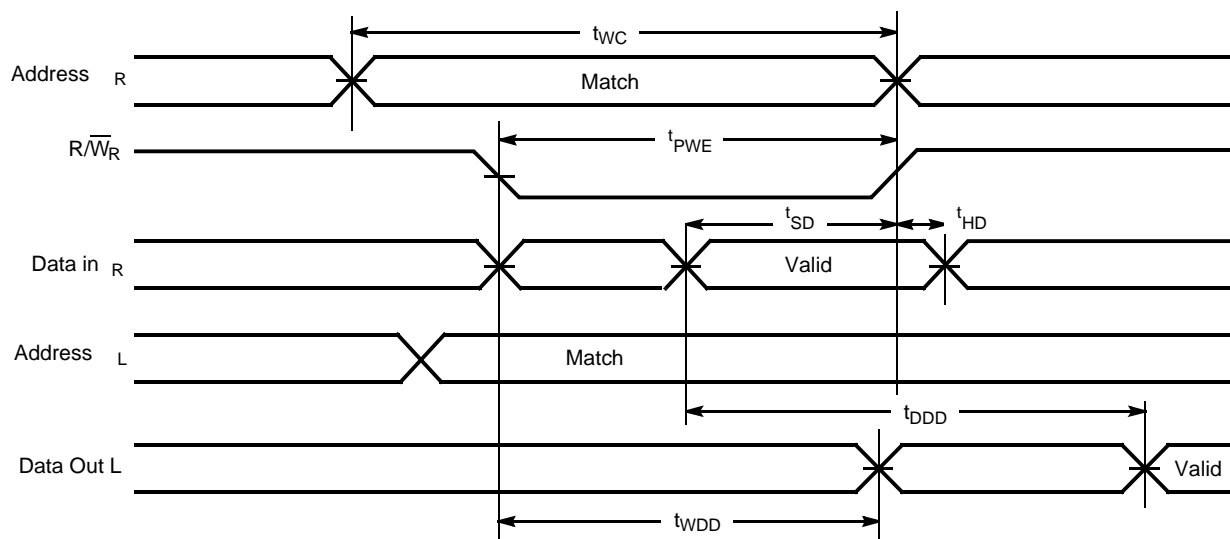

Figure 7. Read Timing with Port-to-Port Delay ($M/\overline{S}=L$)^[17, 18]

Notes

13. R/\overline{W} is HIGH for read cycle.
14. Device is continuously selected $\overline{CE} = \text{LOW}$ and $\overline{OE} = \text{LOW}$. This waveform cannot be used for semaphore reads.
15. Address valid prior to or coincident with \overline{CE} transition LOW.
16. $\overline{CE}_L = L$, $\overline{SEM} = H$ when accessing RAM. $\overline{CE} = H$, $\overline{SEM} = L$ when accessing semaphores.
17. $\overline{BUSY} = \text{HIGH}$ for the writing port.
18. $\overline{CE}_L = \overline{CE}_R = \text{LOW}$.

Switching Waveforms (continued)

Figure 8. Write Cycle No. 1: \overline{OE} Three-State Data I/Os (Either Port)^[19, 20, 21]

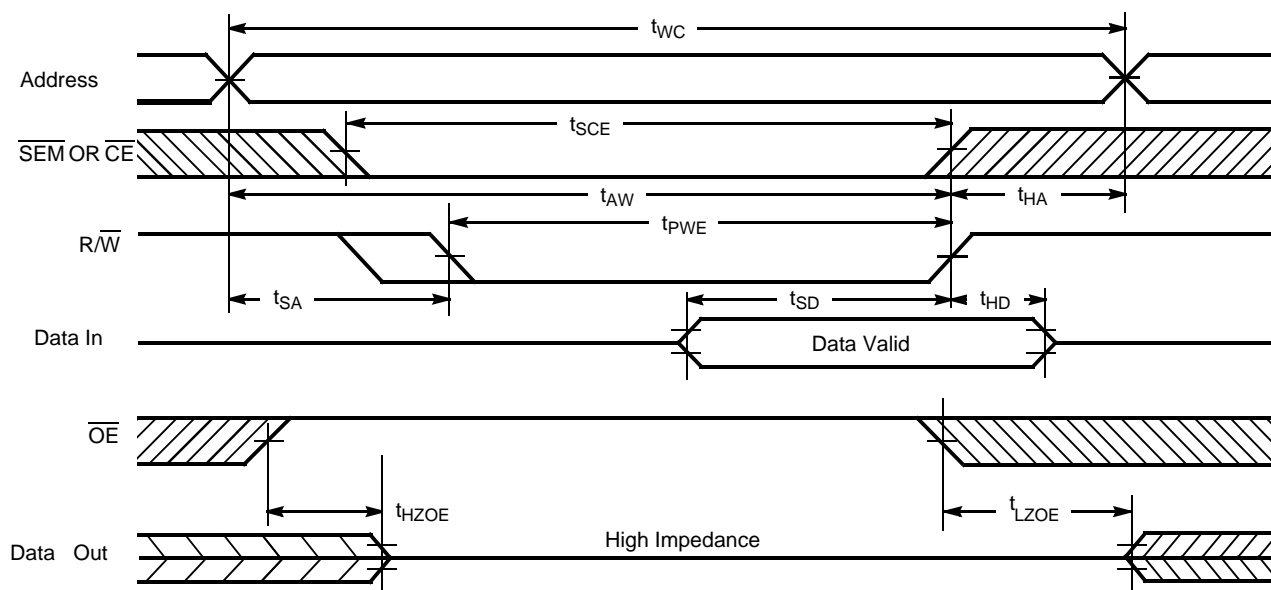

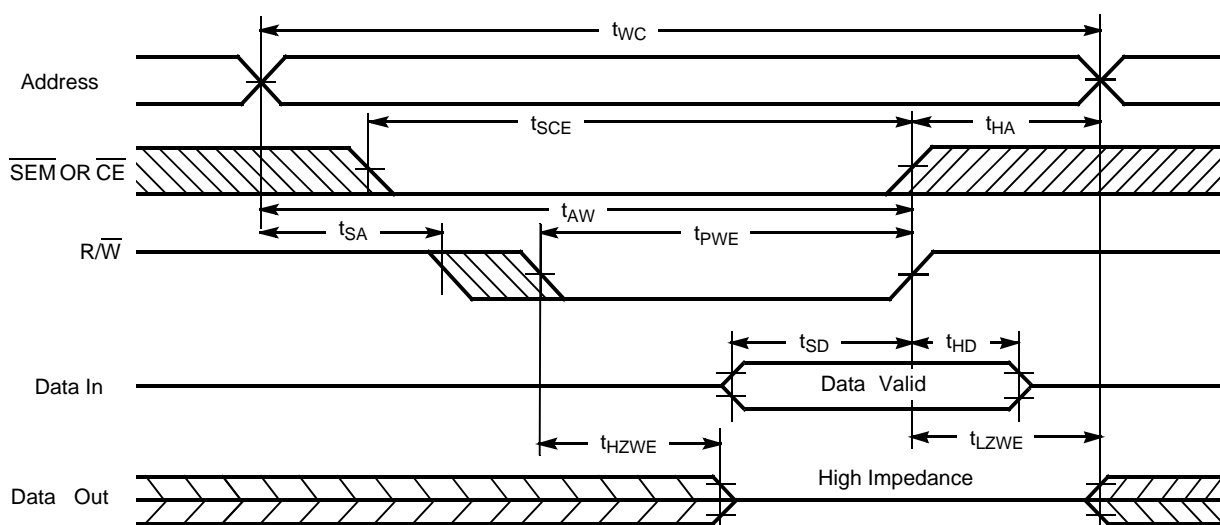

Figure 9. Write Cycle No. 2: $\overline{R/W}$ Three-State Data I/Os (Either Port)^[19, 21, 22]

Notes

19. The internal write time of the memory is defined by the overlap of \overline{CE} or \overline{SEM} LOW and $\overline{R/W}$ LOW. Both signals must be LOW to initiate a write, and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
20. If OE is LOW during a R/W controlled write cycle, the write pulse width must be the larger of t_{PWE} or ($t_{HZWE} + t_{SD}$) to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{SD} . If OE is HIGH during a R/W controlled write cycle (as in this example), this requirement does not apply and the write pulse can be as short as the specified t_{PWE} .
21. R/W must be HIGH during all address transitions.
22. Data I/O pins enter high impedance when OE is held LOW during write.

Switching Waveforms (continued)

Figure 10. Semaphore Read After Write Timing, Either Side^[23]

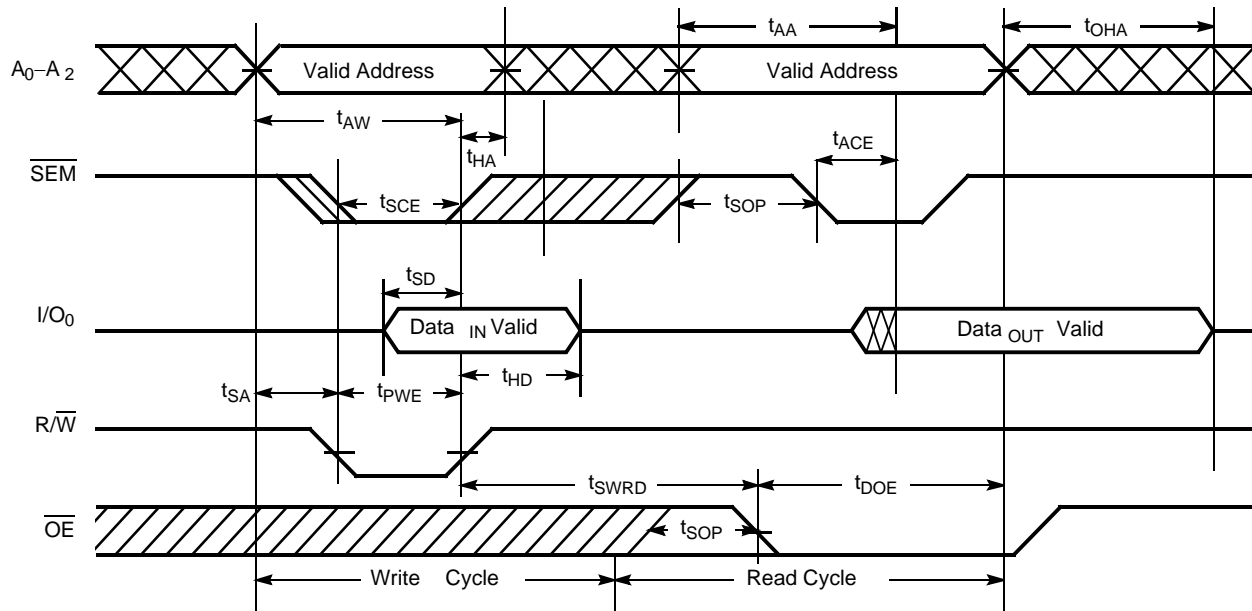

Figure 11. Semaphore Contention^[24, 25, 26]

Notes

23. \overline{CE} = HIGH for the duration of the above timing (both write and read cycle).

24. $I/O_{0R} = I/O_{0L} = \text{LOW}$ (request semaphore); $\overline{CE}_R = \overline{CE}_L = \text{HIGH}$

25. Semaphores are reset (available to both ports) at cycle start.

26. If t_{SPS} is violated, the semaphore will definitely be obtained by one side or the other, but there is no guarantee which side will control the semaphore.

Switching Waveforms (continued)

Figure 12. Read with $\overline{\text{BUSY}}$ (M/S=HIGH)^[27]

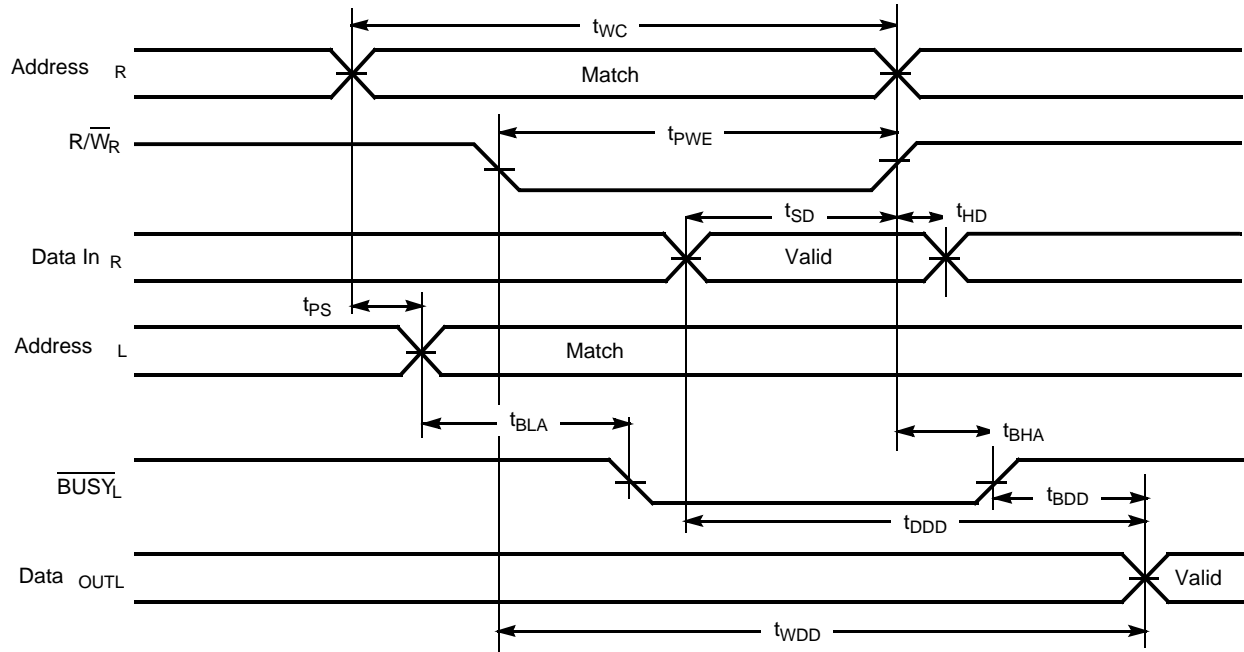

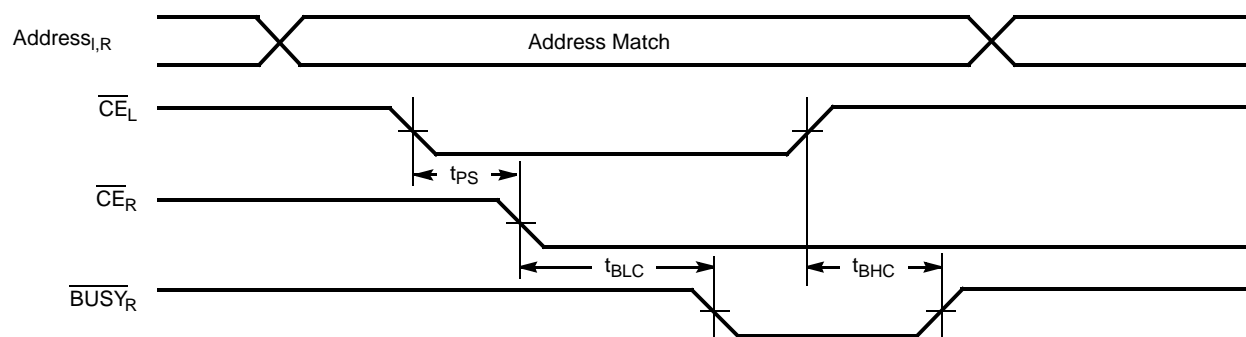

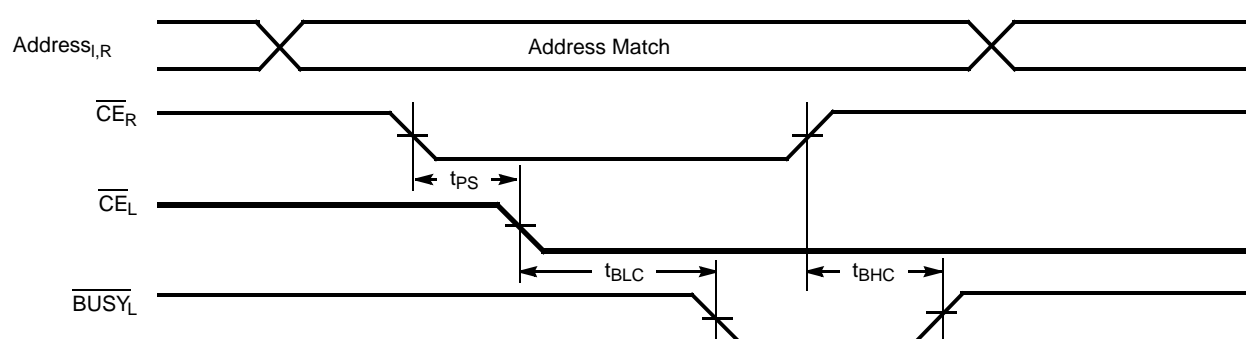

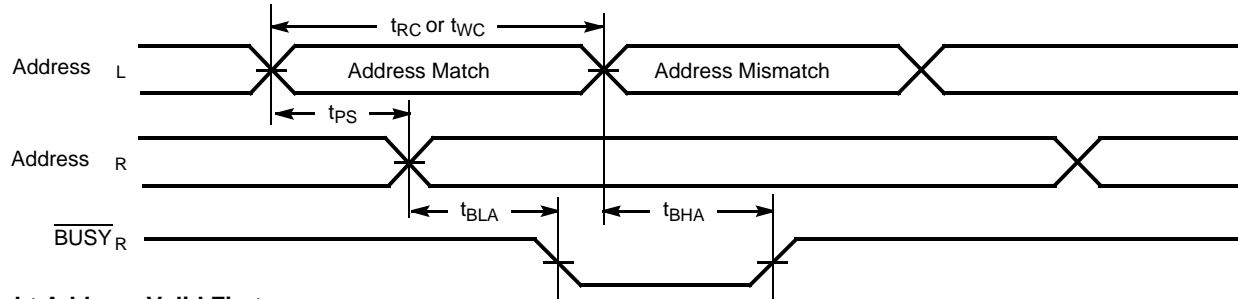

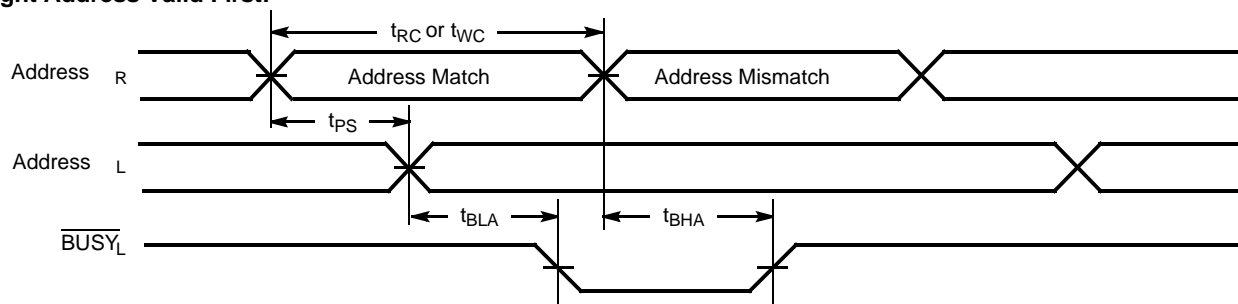

Figure 13. Write Timing with Busy Input (M/S=LOW)

Note
27. $\overline{\text{CE}}_L = \overline{\text{CE}}_R = \text{LOW}$.

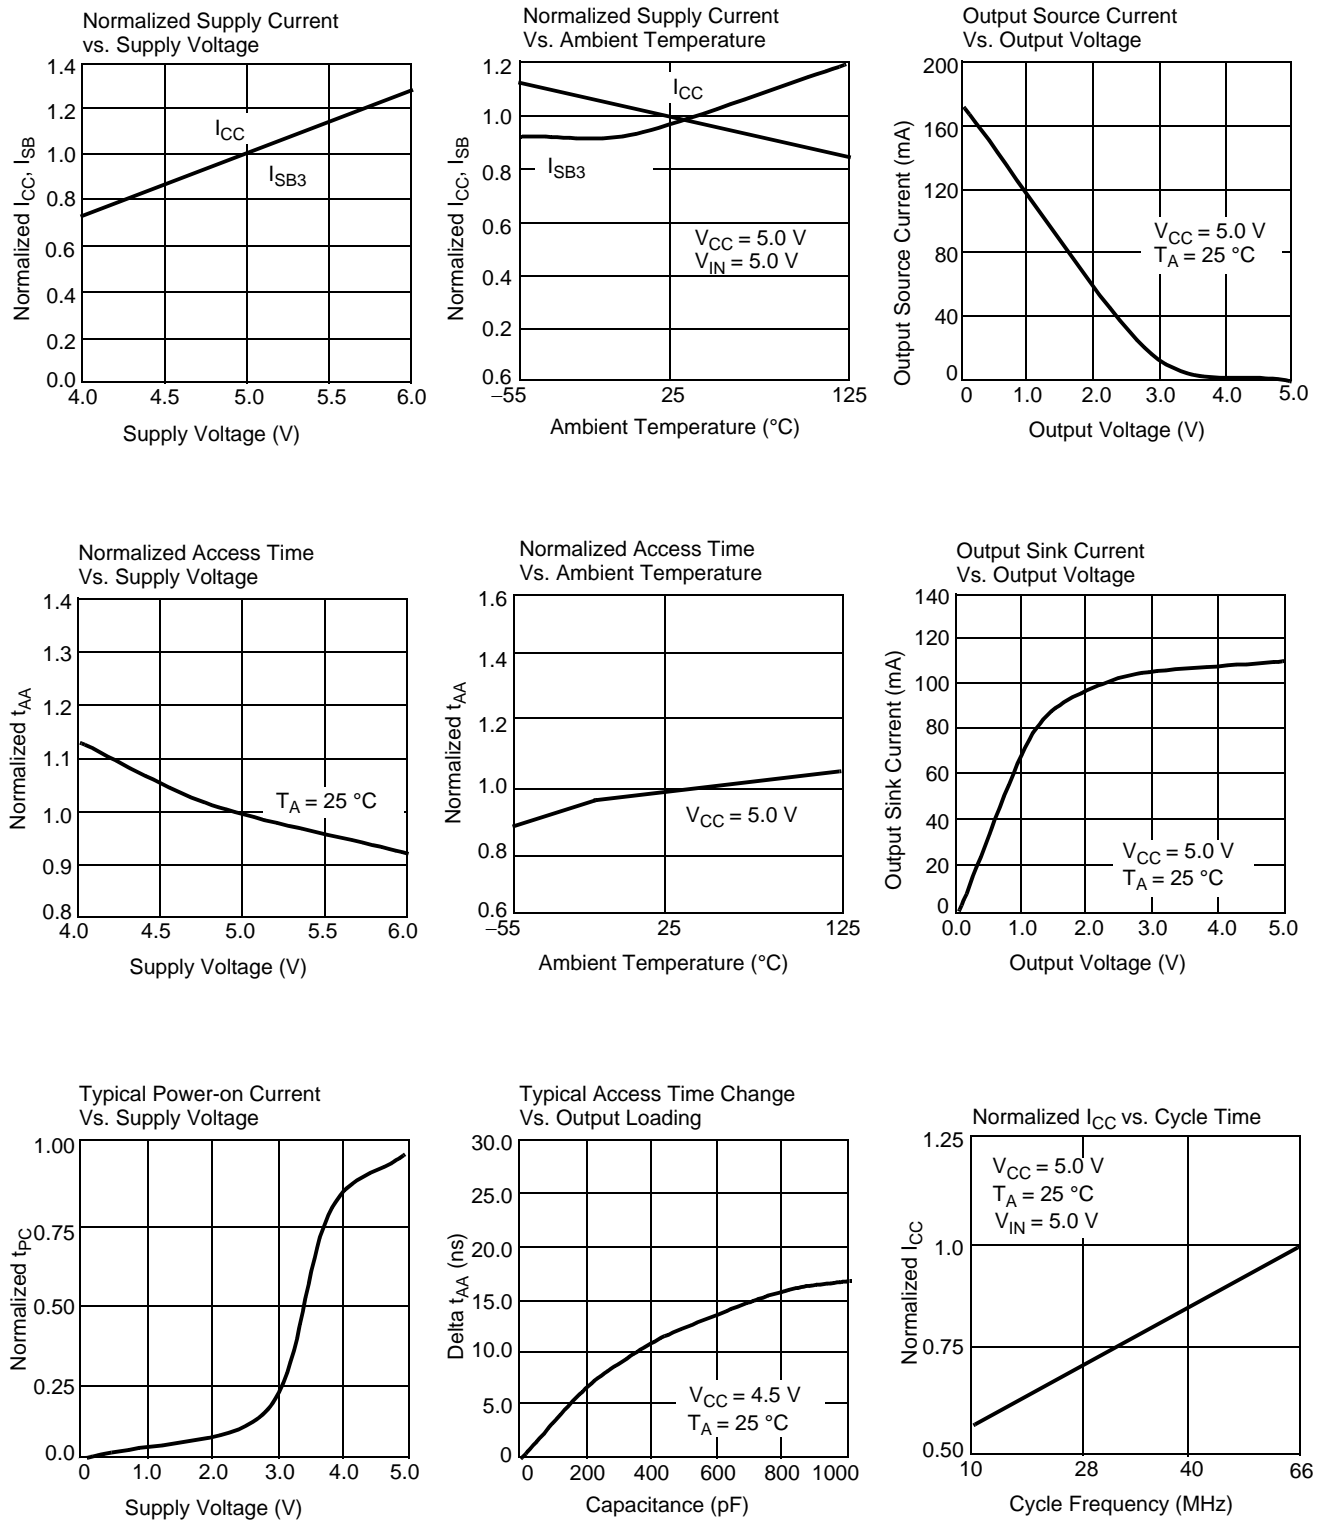

Switching Waveforms (continued)

*C	393320	YIM	See ECN	Added Pb-free Logo Added Pb-free parts to ordering information: CY7C144-15AXC, CY7C144-15JXC, CY7C144-15AXI, CY7C144-25AXC, CY7C144-55AXC, CY7C144-55JXC, CY7C145-15AXC, CY7C145-35JXC
*D	2623658	VKN/PYRS	12/17/2008	Added CY7C144-15JXI in the Ordering information table
*E	2699693	VKN/PYRS	04/29/2009	Corrected defective Logic Block diagram, Pinouts and Package diagrams
*F	2896210	RAME	03/22/2010	Updated Ordering Information Updated Package Diagrams
*G	3054633	ADMU	10/11/2010	Updated Ordering Information and added Ordering Code Definitions .
*H	3099184	ADMU	12/02/2010	Removed parts: CY7C144-55AC & CY7C144-55JC Removed speed bin -35 Updated as per new template Added Acronyms and Units of Measure table Added Ordering Code Definitions Updated all footnotes as per new template
*I	3402163	ADMU	10/12/2011	Removed pruned part CY7C145-15AXC from Ordering Information Updated Ordering Code Definitions , Package Diagrams .

Sales, Solutions and Legal Information

Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at [Cypress Locations](#).

Products

© Cypress Semiconductor Corporation, 2009-2011. The information contained herein is subject to change without notice. Cypress Semiconductor Corporation assumes no responsibility for the use of any circuitry other than circuitry embodied in a Cypress product. Nor does it convey or imply any license under patent or other rights. Cypress products are not warranted nor intended to be used for medical, life support, life saving, critical control or safety applications, unless pursuant to an express written agreement with Cypress. Furthermore, Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress products in life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Any Source Code (software and/or firmware) is owned by Cypress Semiconductor Corporation (Cypress) and is protected by and subject to worldwide patent protection (United States and foreign), United States copyright laws and international treaty provisions. Cypress hereby grants to licensee a personal, non-exclusive, non-transferable license to copy, use, modify, create derivative works of, and compile the Cypress Source Code and derivative works for the sole purpose of creating custom software and or firmware in support of licensee product to be used only in conjunction with a Cypress integrated circuit as specified in the applicable agreement. Any reproduction, modification, translation, compilation, or representation of this Source Code except as specified above is prohibited without the express written permission of Cypress.

Disclaimer: CYPRESS MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARD TO THIS MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. Cypress reserves the right to make changes without further notice to the materials described herein. Cypress does not assume any liability arising out of the application or use of any product or circuit described herein. Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress' product in a life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Use may be limited by and subject to the applicable Cypress software license agreement.
