Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

- Test voltage must be applied within dv/dt rating.
- This is static dv/dt. Commutating dv/dt is a function of the load-driving thyristor(s) only.
- All devices are guaranteed to trigger at an I<sub>F</sub> value less than or equal to max I<sub>FT</sub>. Therefore, recommended operating I<sub>F</sub> lies between max I<sub>FT</sub> (2 mA for FOD420 and FOD4208 and 1.3 mA for FOD4216 and FOD4218) and the absolute max I<sub>F</sub> (30 mA).
- Isolation voltage, V<sub>ISO</sub>, is an internal device dielectric breakdown rating. For this test, pins 1, 2 and 3 are common, and pins 4, 5 and 6 are common. 5,000 VAC<sub>RMS</sub> for 1 minute duration is equivalent to 6,000 VAC<sub>RMS</sub> for 1 second duration.

## TYPICAL APPLICATION

Figure 1 shows a typical circuit for when hot line switching is required. In this circuit the “hot” side of the line is switched and the load connected to the cold or neutral side. The load may be connected to either the neutral or hot line.

$R_{in}$  is calculated so that IF is equal to the rated IFT of the

part, 2 mA for FOD420 and FOD4208, 1.3 mA for FOD4216 and FOD4218. The 39  $\Omega$  resistor and 0.01  $\mu$ F capacitor are for snubbing of the triac and may or may not be necessary depending upon the particular triac and load use.

\*For highly inductive loads (power factor < 0.5), change this value to 360  $\Omega$ .

**Figure 1. Hot-Line Switching Application Circuit**

**Figure 2. Inverse-Parallel SCR Driver Circuit**

Suggested method of firing two, back-to-back SCR's with On Semiconductor triac driver. Diodes can be 1N4001; resistors, R1 and R2, are optional 330  $\Omega$ .

**NOTE:** This optoisolator should not be used to drive a load directly. It is intended to be a discrete triac driver device only.
