

# LTC2050/LTC2050HV

## ABSOLUTE MAXIMUM RATINGS

(Note 1)

Total Supply Voltage ( $V^+$  to  $V^-$ )

LTC2050 ..... 7V

LTC2050HV ..... 12V

Input Voltage ..... ( $V^+ + 0.3V$ ) to ( $V^- - 0.3V$ )

Output Short-Circuit Duration ..... Indefinite

Operating Temperature Range

LTC2050 .....  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$

LTC2050HVMP .....  $-55^{\circ}\text{C}$  to  $150^{\circ}\text{C}$

Specified Temperature Range

(Note 3) .....  $-55^{\circ}\text{C}$  to  $150^{\circ}\text{C}$

Storage Temperature Range .....  $-65^{\circ}\text{C}$  to  $150^{\circ}\text{C}$

Lead Temperature (Soldering, 10 sec) .....  $300^{\circ}\text{C}$

## PIN CONFIGURATION

**Note 1:** Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

**Note 2:** These parameters are guaranteed by design. Thermocouple effects preclude measurements of these voltage levels during automated testing.

**Note 3:** All versions of the LTC2050 are designed, characterized and expected to meet the extended temperature limits of  $-40^\circ\text{C}$  and  $125^\circ\text{C}$ .

The LTC2050C/LTC2050HVC are guaranteed to meet the temperature limits of  $0^\circ\text{C}$  and  $70^\circ\text{C}$ . The LTC2050I/LTC2050HVI are guaranteed to meet the temperature limits of  $-40^\circ\text{C}$  and  $85^\circ\text{C}$ . The LTC2050H/LTC2050HVH are guaranteed to meet the temperature limits of  $-40^\circ\text{C}$  and  $125^\circ\text{C}$ . The are guaranteed to meet the temperature limits of  $-55^\circ\text{C}$  and  $150^\circ\text{C}$ .

**Note 4:** The bias current measurement accuracy depends on the proximity of the supply bypass capacitor to the device under test, especially at  $\pm 5\text{V}$  supplies. Because of testing limitations on the placement of this bypass capacitor, the bias current at  $\pm 5\text{V}$  supplies is guaranteed by design to meet the data sheet limits, but tested to relaxed limits.

## APPLICATIONS INFORMATION

### Shutdown

The LTC2050 includes a shutdown pin in the 6-lead SOT-23 and the SO-8 version. When this active low pin is high or allowed to float, the device operates normally. When the shutdown pin is pulled low, the device enters shutdown mode; supply current drops to 3 $\mu$ A, all clocking stops, and both inputs and output assume a high impedance state.

### Clock Feedthrough, Input Bias Current

The LTC2050 uses auto-zeroing circuitry to achieve an almost zero DC offset over temperature, common mode voltage, and power supply voltage. The frequency of the clock used for auto-zeroing is typically 7.5kHz. The term clock feedthrough is broadly used to indicate visibility of this clock frequency in the op amp output spectrum. There are typically two types of clock feedthrough in auto zeroed op amps like the LTC2050.

The first form of clock feedthrough is caused by the settling of the internal sampling capacitor and is input referred; that is, it is multiplied by the closed loop gain of the op amp. This form of clock feedthrough is independent of the magnitude of the input source resistance or the magnitude of the gain setting resistors. The LTC2050 has a residue clock feedthrough of less than 1 $\mu$ V<sub>RMS</sub> input referred at 7.5kHz.

The second form of clock feedthrough is caused by the small amount of charge injection occurring during the sampling and holding of the op amp's input offset voltage. The current spikes are multiplied by the impedance seen at the input terminals of the op amp, appearing at the

output multiplied by the closed loop gain of the op amp. To reduce this form of clock feedthrough, use smaller valued gain setting resistors and minimize the source resistance at the input. If the resistance seen at the inputs is less than 10k, this form of clock feedthrough is less than 1 $\mu$ V<sub>RMS</sub> input referred at 7.5kHz, or less than the amount of residue clock feedthrough from the first form described above.

Placing a capacitor across the feedback resistor reduces either form of clock feedthrough by limiting the bandwidth of the closed loop gain.

Input bias current is defined as the DC current into the input pins of the op amp. The same current spikes that cause the second form of clock feedthrough described above, when averaged, dominate the DC input bias current of the op amp below 70°C.

At temperatures above 70°C, the leakage of the ESD protection diodes on the inputs increases the input bias currents of both inputs in the positive direction, while the current caused by the charge injection stays relatively constant. At elevated temperatures (above 85°C) the leakage current begins to dominate and both the negative and positive pin's input bias currents are in the positive direction (into the pins).

### Input Pins, ESD Sensitivity

ESD voltages above 700V on the input pins of the op amp will cause the input bias currents to increase (more DC current into the pins). At these voltages, it is possible to damage the device to a point where the input bias current exceeds the maximums specified in this data sheet.

## S6 Package 6-Lead Plastic TSOT-23 (Reference LTC DWG # 05-08-1636)

- NOTE:
1. DIMENSIONS ARE IN MILLIMETERS
  2. DRAWING NOT TO SCALE
  3. DIMENSIONS ARE INCLUSIVE OF PLATING
  4. DIMENSIONS ARE EXCLUSIVE OF MOLD FLASH AND METAL BURR
  5. MOLD FLASH SHALL NOT EXCEED 0.254mm
  6. JEDEC PACKAGE REFERENCE IS MO-193

S6 TSOT-23 0302

## PACKAGE DESCRIPTION

### S8 Package 8-Lead Plastic Small Outline (Narrow .150 Inch) (Reference LTC DWG # 05-08-1610 Rev G)

**REVISION HISTORY** (Revision history begins at Rev D)

| REV | DATE  | DESCRIPTION                                  | PAGE NUMBER    |
|-----|-------|----------------------------------------------|----------------|
| D   | 08/17 | Updated T <sub>JMAX</sub>                    | 2              |
| E   | 11/18 | Added MP option (higher temperature version) | 1, 2, 4-6, 7-8 |

TYPICAL APPLICATION

Ground Referred Precision Current Sources
