1 Description

The M48Z08/18 ZEROPOWER® RAM is an 8 K x 8 non-volatile static RAM which is pin and function compatible with the DS1225.

The monolithic chip provides a highly integrated battery-backed memory solution.

The M48Z08/18 is a non-volatile pin and function equivalent to any JEDEC standard 8 K x 8 SRAM. It also easily fits into many ROM, EPROM, and EEPROM sockets, providing the non-volatility of PROMs without any requirement for special write timing or limitations on the number of writes that can be performed.

The 28-pin, 600 mil DIP CAPHAT™ houses the M48Z08/18 silicon with a long-life lithium button cell in a single package.

Figure 1. Logic diagram

Table 1. Signal names

A0-A12	Address inputs
DQ0-DQ7	Data inputs / outputs
\overline{E}	Chip enable
\overline{G}	Output enable
\overline{W}	WRITE enable
V _{CC}	Supply voltage
V _{SS}	Ground
NC	Not connected internally

Figure 2. DIP connections

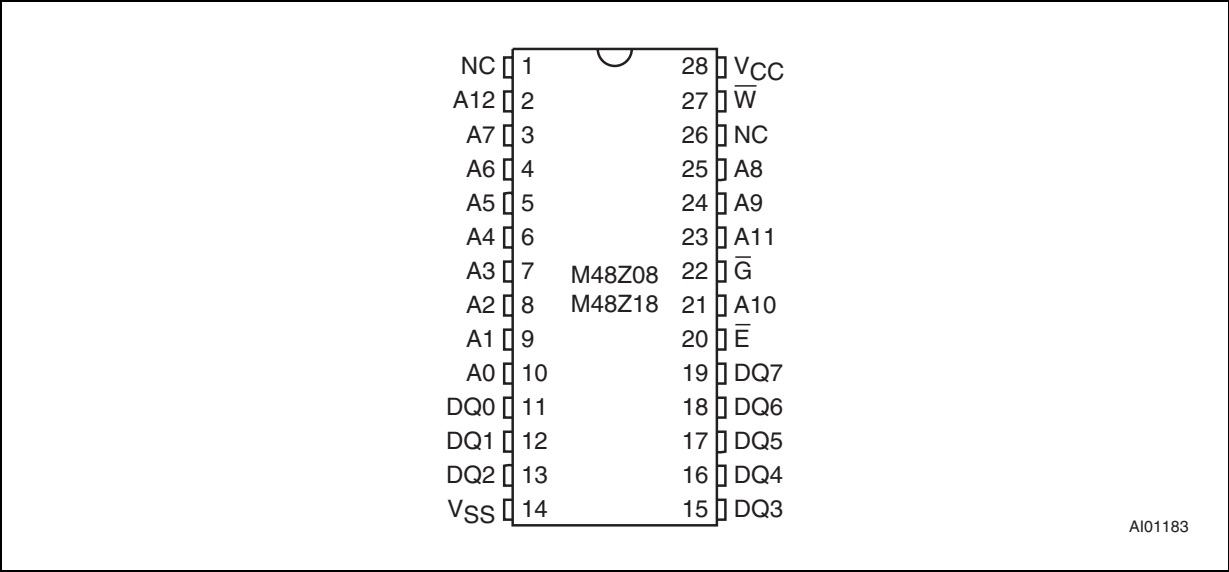

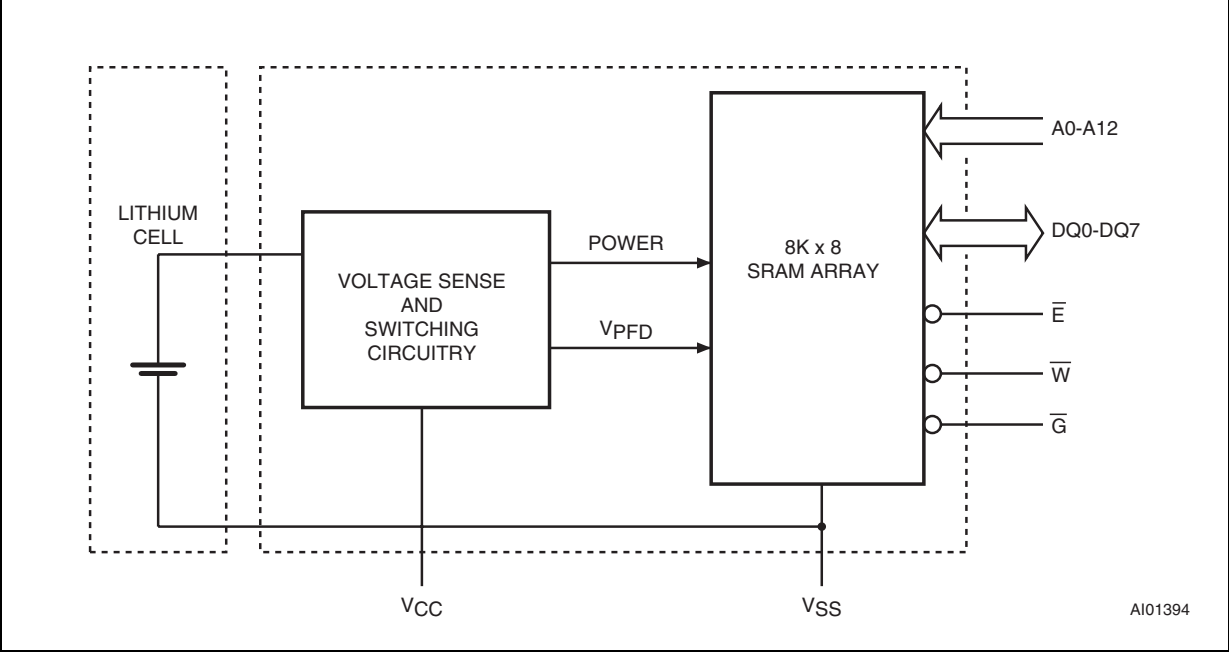

Figure 3. Block diagram

2 Operation modes

The M48Z08/18 also has its own power-fail detect circuit. The control circuitry constantly monitors the single 5 V supply for an out of tolerance condition. When V_{CC} is out of tolerance, the circuit write protects the SRAM, providing a high degree of data security in the midst of unpredictable system operation brought on by low V_{CC} . As V_{CC} falls below approximately 3 V, the control circuitry connects the battery which maintains data until valid power returns.

Table 2. Operating modes

Mode	V_{CC}	E	G	W	DQ0-DQ7	Power
Deselect	4.75 to 5.5 V or 4.5 to 5.5 V	V_{IH}	X	X	High Z	Standby
WRITE		V_{IL}	X	V_{IL}	D_{IN}	Active
READ		V_{IL}	V_{IL}	V_{IH}	D_{OUT}	Active
READ		V_{IL}	V_{IH}	V_{IH}	High Z	Active
Deselect	V_{SO} to $V_{PFD(min)}^{(1)}$	X	X	X	High Z	CMOS standby
Deselect	$\leq V_{SO}^{(1)}$	X	X	X	High Z	Battery backup mode

1. See [Table 10 on page 15](#) for details.

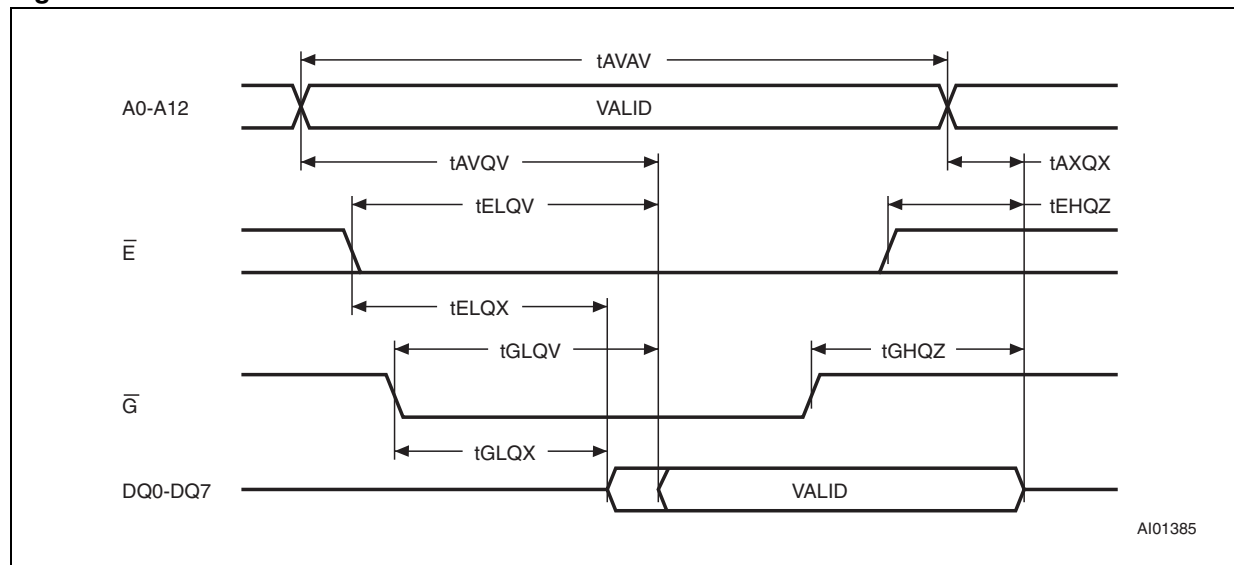

Note: $X = V_{IH}$ or V_{IL} ; V_{SO} = Battery backup switchover voltage.

2.1 READ mode

The M48Z08/18 is in the READ mode whenever \overline{W} (WRITE enable) is high and \overline{E} (chip enable) is low. The device architecture allows ripple-through access of data from eight of 65,536 locations in the static storage array. Thus, the unique address specified by the 13 address inputs defines which one of the 8,192 bytes of data is to be accessed. Valid data will be available at the data I/O pins within address access time (t_{AVQV}) after the last address input signal is stable, providing that the \overline{E} and \overline{G} access times are also satisfied. If the \overline{E} and \overline{G} access times are not met, valid data will be available after the latter of the chip enable access time (t_{ELQV}) or output enable access time (t_{GLQV}).

The state of the eight three-state data I/O signals is controlled by \overline{E} and \overline{G} . If the outputs are activated before t_{AVQV} , the data lines will be driven to an indeterminate state until t_{AVQV} . If the address inputs are changed while \overline{E} and \overline{G} remain active, output data will remain valid for output data hold time (t_{AXQX}) but will go indeterminate until the next address access.

Figure 4. READ mode AC waveforms

Note: WRITE enable (\overline{W}) = high.

Table 3. READ mode AC characteristics

Symbol	Parameter ⁽¹⁾	M48Z08/M48Z18		Unit
		Min	Max	
t_{AVAV}	READ cycle time	100		ns
t_{AVQV}	Address valid to output valid		100	ns
t_{ELQV}	Chip enable low to output valid		100	ns
t_{GLQV}	Output enable low to output valid		50	ns
$t_{ELQX}^{(2)}$	Chip enable low to output transition	10		ns
$t_{GLQX}^{(2)}$	Output enable low to output transition	5		ns
$t_{EHQZ}^{(2)}$	Chip enable high to output Hi-Z		50	ns
$t_{GHQZ}^{(2)}$	Output enable high to output Hi-Z		40	ns
t_{AXQX}	Address transition to output transition	5		ns

1. Valid for ambient operating temperature: $T_A = 0$ to 70°C ; $V_{CC} = 4.75$ to 5.5 V or 4.5 to 5.5 V (except where noted).

2. $C_L = 30$ pF.

2.2 WRITE mode

The M48Z08/18 is in the WRITE mode whenever \overline{W} and \overline{E} are active. The start of a WRITE is referenced from the latter occurring falling edge of \overline{W} or \overline{E} .

A WRITE is terminated by the earlier rising edge of \overline{W} or \overline{E} . The addresses must be held valid throughout the cycle. \overline{E} or \overline{W} must return high for a minimum of t_{EHAX} from chip enable or t_{WHAX} from WRITE Enable prior to the initiation of another READ or WRITE cycle. Data-in must be valid t_{DVWH} prior to the end of WRITE and remain valid for t_{WHDx} afterward. \overline{G} should be kept high during WRITE cycles to avoid bus contention; although, if the output bus has been activated by a low on \overline{E} and \overline{G} , a low on \overline{W} will disable the outputs t_{WLQZ} after \overline{W} falls.

Figure 5. WRITE enable controlled, WRITE mode AC waveform

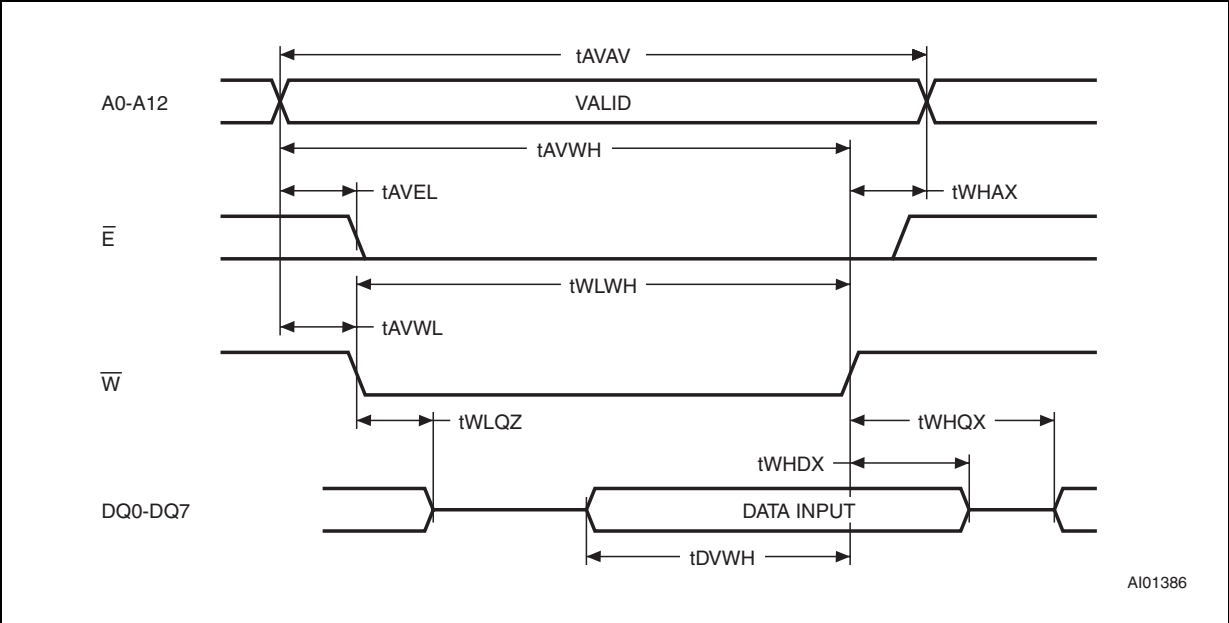

Figure 6. Chip enable controlled, WRITE mode AC waveforms

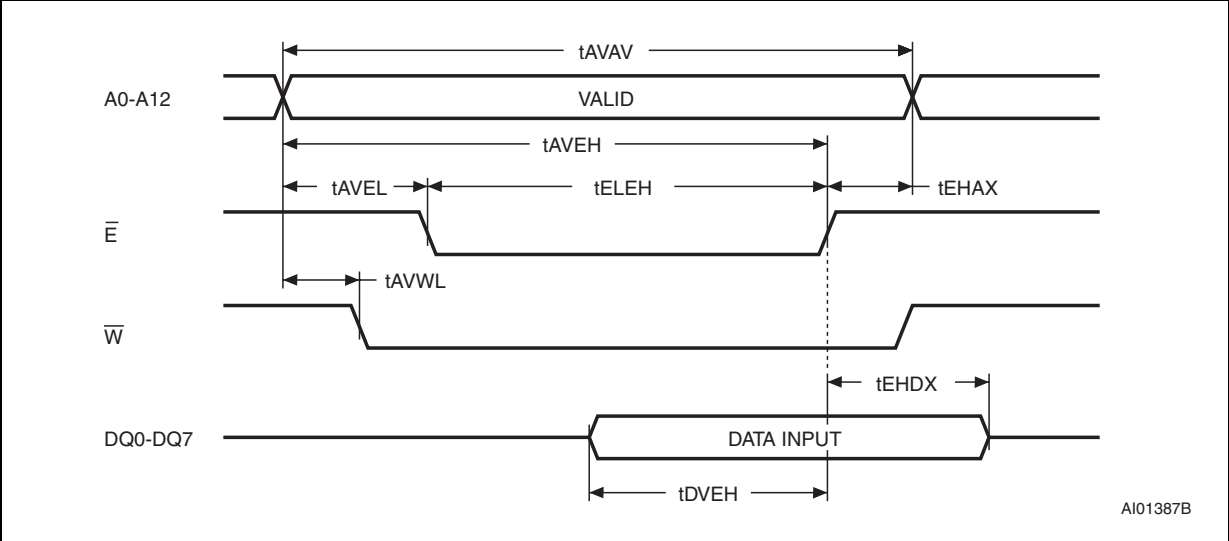

Table 4. WRITE mode AC characteristics

Symbol	Parameter ⁽¹⁾	M48Z08/M48Z18		Unit
		Min	Max	
t_{AVAV}	WRITE cycle time	100		ns
t_{AVWL}	Address valid to WRITE enable low	0		ns
t_{AVEL}	Address valid to chip enable 1 low	0		ns
t_{WLWH}	WRITE enable pulse width	80		ns
t_{ELEH}	Chip enable low to chip enable 1 high	80		ns
t_{WHAX}	WRITE enable high to address transition	10		ns
t_{EHAX}	Chip enable high to address transition	10		ns
t_{DVWH}	Input valid to WRITE enable high	50		ns
t_{DVEH}	Input valid to chip enable 1 high	30		ns
t_{WHDX}	WRITE enable high to input transition	5		ns
t_{EHDx}	Chip enable high to input transition	5		ns
$t_{WLQZ}^{(2)(3)}$	WRITE enable low to output Hi-Z		50	ns
t_{AVWH}	Address valid to WRITE enable high	80		ns
t_{AVEH}	Address valid to chip enable high	80		ns
$t_{WHQX}^{(2)(3)}$	WRITE enable high to output transition	10		ns

1. Valid for ambient operating temperature: $T_A = 0$ to 70°C ; $V_{CC} = 4.75$ to 5.5 V or 4.5 to 5.5 V (except where noted).

2. $C_L = 30\text{ pF}$.

3. If \overline{E} goes low simultaneously with \overline{W} going low, the outputs remain in the high impedance state.

2.3 Data retention mode

With valid V_{CC} applied, the M48Z08/18 operates as a conventional BYTEWIDE™ static RAM. Should the supply voltage decay, the RAM will automatically power-fail deselect, write protecting itself when V_{CC} falls within the $V_{PFD}(\text{max})$, $V_{PFD}(\text{min})$ window. All outputs become high impedance, and all inputs are treated as “Don't care.”

Note: A power failure during a WRITE cycle may corrupt data at the currently addressed location, but does not jeopardize the rest of the RAM's content. At voltages below $V_{PFD}(\text{min})$, the user can be assured the memory will be in a write protected state, provided the V_{CC} fall time is not less than t_F . The M48Z08/18 may respond to transient noise spikes on V_{CC} that reach into the deselect window during the time the device is sampling V_{CC} . Therefore, decoupling of the power supply lines is recommended.

When V_{CC} drops below V_{SO} , the control circuit switches power to the internal battery which preserves data. The internal button cell will maintain data in the M48Z08/18 for an accumulated period of at least 11 years when V_{CC} is less than V_{SO} .

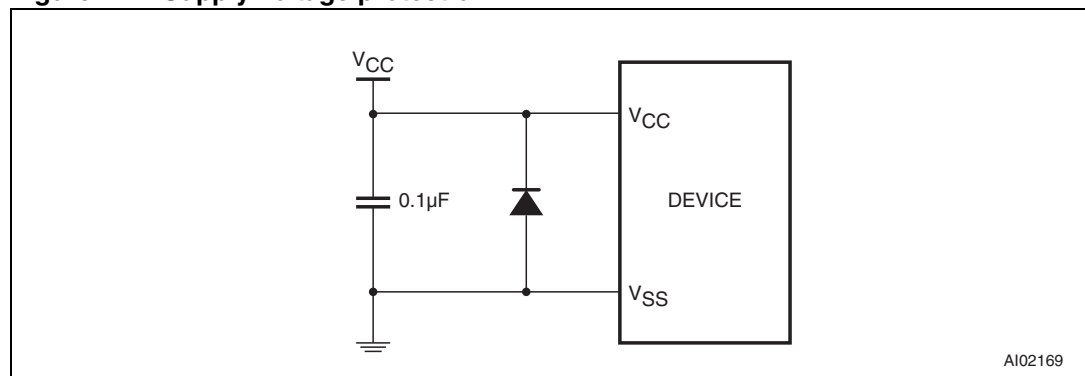

As system power returns and V_{CC} rises above V_{SO} , the battery is disconnected, and the power supply is switched to external V_{CC} . Write protection continues until V_{CC} reaches $V_{PFD}(\text{min})$ plus $t_{rec}(\text{min})$. \overline{E} should be kept high as V_{CC} rises past $V_{PFD}(\text{min})$ to prevent inadvertent write cycles prior to system stabilization. Normal RAM operation can resume t_{rec} after V_{CC} exceeds $V_{PFD}(\text{max})$. For more information on battery storage life refer to the application note AN1012.

2.4 V_{CC} noise and negative going transients

I_{CC} transients, including those produced by output switching, can produce voltage fluctuations, resulting in spikes on the V_{CC} bus. These transients can be reduced if capacitors are used to store energy which stabilizes the V_{CC} bus. The energy stored in the bypass capacitors will be released as low going spikes are generated or energy will be absorbed when overshoots occur. A ceramic bypass capacitor value of $0.1\ \mu\text{F}$ (as shown in [Figure 7](#)) is recommended in order to provide the needed filtering.

In addition to transients that are caused by normal SRAM operation, power cycling can generate negative voltage spikes on V_{CC} that drive it to values below V_{SS} by as much as one volt. These negative spikes can cause data corruption in the SRAM while in battery backup mode. To protect from these voltage spikes, STMicroelectronics recommends connecting a Schottky diode from V_{CC} to V_{SS} (cathode connected to V_{CC} , anode to V_{SS}). Schottky diode 1N5817 is recommended for through hole and MBRS120T3 is recommended for surface mount.

Figure 7. Supply voltage protection

3 Maximum ratings

Stressing the device above the rating listed in the absolute maximum ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 5. Absolute maximum ratings

Symbol	Parameter	Value	Unit
T_A	Ambient operating temperature	0 to 70	°C
T_{STG}	Storage temperature (V_{CC} off, oscillator off)	–40 to 85	°C
$T_{SLD}^{(1)}$	Lead solder temperature for 10 seconds	260	°C
V_{IO}	Input or output voltages	–0.3 to 7	V
V_{CC}	Supply voltage	–0.3 to 7	V
I_O	Output current	20	mA
P_D	Power dissipation	1	W

1. Soldering temperature of the IC leads is to not exceed 260 °C for 10 seconds. Furthermore, the devices shall not be exposed to IR reflow nor preheat cycles (as performed as part of wave soldering). ST recommends the devices be hand-soldered or placed in sockets to avoid heat damage to the batteries.

Caution: *Negative undershoots below –0.3 V are not allowed on any pin while in the battery backup mode.*

4 DC and AC parameters

This section summarizes the operating and measurement conditions, as well as the DC and AC characteristics of the device. The parameters in the following DC and AC characteristic tables are derived from tests performed under the measurement conditions listed in the relevant tables. Designers should check that the operating conditions in their projects match the measurement conditions when using the quoted parameters.

Table 6. Operating and AC measurement conditions

Parameter	M48Z08	M48Z18	Unit
Supply voltage (V_{CC})	4.75 to 5.5	4.5 to 5.5	V
Ambient operating temperature (T_A)	0 to 70	0 to 70	°C
Load capacitance (C_L)	100	100	pF
Input rise and fall times	≤ 5	≤ 5	ns
Input pulse voltages	0 to 3	0 to 3	V
Input and output timing ref. voltages	1.5	1.5	V

Note: Output Hi-Z is defined as the point where data is no longer driven.

Figure 8. AC testing load circuit

Table 7. Capacitance

Symbol	Parameter ⁽¹⁾⁽²⁾	Min	Max	Unit
C_{IN}	Input capacitance	-	10	pF
$C_{IO}^{(3)}$	Input / output capacitance	-	10	pF

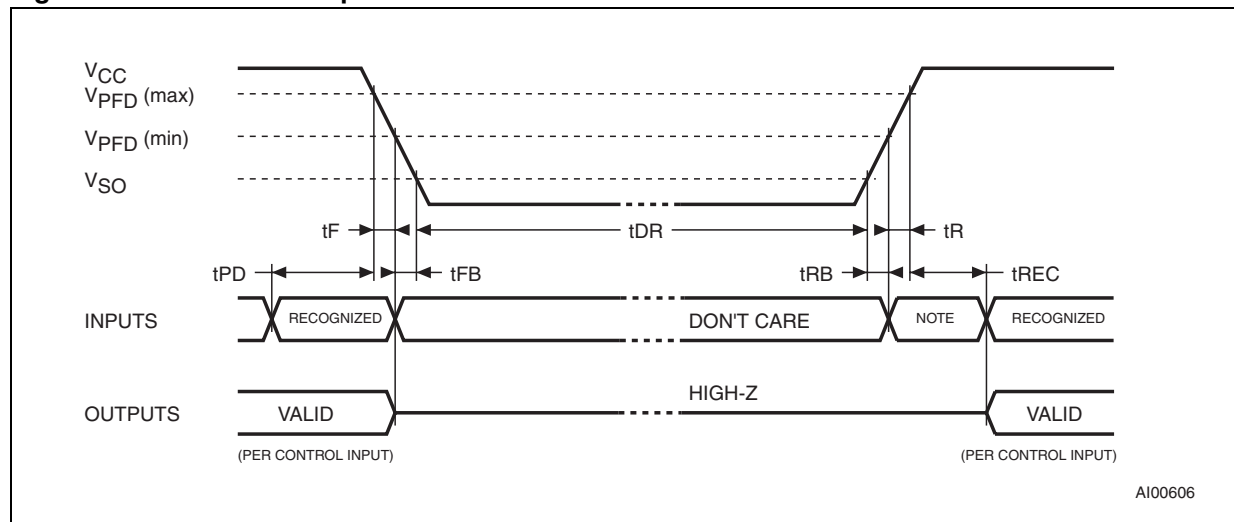

1. Effective capacitance measured with power supply at 5 V; sampled only, not 100% tested.
2. At 25 °C, $f = 1$ MHz.
3. Outputs deselected.

Table 8. DC characteristics

Symbol	Parameter	Test condition ⁽¹⁾	Min	Max	Unit
I_{LI}	Input leakage current	$0\text{ V} \leq V_{IN} \leq V_{CC}$		± 1	μA
$I_{LO}^{(2)}$	Output leakage current	$0\text{ V} \leq V_{OUT} \leq V_{CC}$		± 1	μA
I_{CC}	Supply current	Outputs open		80	mA
I_{CC1}	Supply current (standby) TTL	$\bar{E} = V_{IH}$		3	mA
I_{CC2}	Supply current (standby) CMOS	$\bar{E} = V_{CC} - 0.2\text{ V}$		3	mA
V_{IL}	Input low voltage		-0.3	0.8	V
V_{IH}	Input high voltage		2.2	$V_{CC} + 0.3$	V
V_{OL}	Output low voltage	$I_{OL} = 2.1\text{ mA}$		0.4	V
V_{OH}	Output high voltage	$I_{OH} = -1\text{ mA}$	2.4		V

1. Valid for ambient operating temperature: $T_A = 0$ to $70\text{ }^\circ\text{C}$; $V_{CC} = 4.75$ to 5.5 V or 4.5 to 5.5 V (except where noted)

2. Outputs deselected.

Figure 9. Power down/up mode AC waveforms

Note: Inputs may or may not be recognized at this time. Caution should be taken to keep \bar{E} high as V_{CC} rises past $V_{PPFD}(\text{min})$. Some systems may perform inadvertent WRITE cycles after V_{CC} rises above $V_{PPFD}(\text{min})$ but before normal system operations begin. Even though a power on reset is being applied to the processor, a reset condition may not occur until after the system is running.

Table 9. Power down/up AC characteristics

Symbol	Parameter ⁽¹⁾	Min	Max	Unit
t_{PD}	\overline{E} or \overline{W} at V_{IH} before power down	0	-	μs
$t_F^{(2)}$	V_{PFD} (max) to V_{PFD} (min) V_{CC} fall time	300	-	μs
$t_{FB}^{(3)}$	V_{PFD} (min) to V_{SS} V_{CC} fall time	10	-	μs
t_R	V_{PFD} (min) to V_{PFD} (max) V_{CC} rise time	0	-	μs
t_{RB}	V_{SS} to V_{PFD} (min) V_{CC} rise time	1	-	μs
t_{rec}	\overline{E} or \overline{W} at V_{IH} before power-up	2	-	ms

- Valid for ambient operating temperature: $T_A = 0$ to $70^\circ C$; $V_{CC} = 4.75$ to 5.5 V or 4.5 to 5.5 V (except where noted).
- V_{PFD} (max) to V_{PFD} (min) fall time of less than t_F may result in deselection/write protection not occurring until $200 \mu s$ after V_{CC} passes V_{PFD} (min).
- V_{PFD} (min) to V_{SS} fall time of less than t_{FB} may cause corruption of RAM data.

Table 10. Power down/up trip points DC characteristics

Symbol	Parameter ⁽¹⁾⁽²⁾		Min	Typ	Max	Unit
V_{PFD}	Power-fail deselect voltage	M48Z08	4.5	4.6	4.75	V
		M48Z18	4.2	4.3	4.5	V
V_{SO}	Battery backup switchover voltage			3.0		V
$t_{DR}^{(3)}$	Expected data retention time		11			Years

- All voltages referenced to V_{SS} .
- Valid for ambient operating temperature: $T_A = 0$ to $70^\circ C$; $V_{CC} = 4.75$ to 5.5 V or 4.5 to 5.5 V (except where noted).
- At $25^\circ C$, $V_{CC} = 0$ V.

5 Package mechanical data

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com. ECOPACK® is an ST trademark

7 Environmental information

Figure 11. Recycling symbols

This product contains a non-rechargeable lithium (lithium carbon monofluoride chemistry) button cell battery fully encapsulated in the final product.

Recycle or dispose of batteries in accordance with the battery manufacturer's instructions and local/national disposal and recycling regulations.

8 Revision history

Table 13. Document revision history

Date	Revision	Changes
Mar-1999	1	First issue
19-Jul-2001	2	2-socket SOH and 2-pin SH packages removed; reformatted; temperature information added to tables (Table 7 , 8 , 3 , 4 , 9 , 10)
19-Dec-2001	2.1	Remove all references to “clock”
21-Dec-2001	2.2	Changes to text to reflect addition of M48Z08Y option
20-May-2002	2.3	Modify reflow time and temperature footnotes (Table 5)
10-Sep-2002	2.4	Remove all references to “SNAPHAT” and M48Z08Y part (Figure 1 ; Table 5 , 6 , 3 , 4 , 10 , 12)
01-Apr-2003	3	v2.2 template applied; updated test condition (Table 10)
28-Aug-2004	4	Reformatted; removed references to ‘crystal’ (Figure 1)
14-Dec-2005	5	Updated template, Lead-free text, removed footnote (Table 8 , 12)
24-Mar-2009	6	Reformatted document; added text to Section 5: Package mechanical data ; added Section 7: Environmental information .
27-May-2010	7	Updated Section 3: Maximum ratings , Table 11 ; reformatted document; minor textual changes.
07-Jun-2011	8	Updated footnote of Table 5: Absolute maximum ratings ; updated Section 7: Environmental information .
