It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include -literature number) you are using.

5.0 PIN DESCRIPTIONS

This section provides a detailed description of each signal. The signals are arranged in functional groups according to their associated interface. The pin descriptions are applied when using the internal default firmware and can be referenced in [Section 7.0, "Configuration Options," on page 21](#). Please reference [Section 1.1, "Acronyms," on page 5](#) for a list of the acronyms used.

The "n" symbol in the signal name indicates that the active, or asserted, state occurs when the signal is at a low voltage level. When "n" is not present in the signal name, the signal is asserted at the high voltage level.

The terms assertion and negation are used exclusively. This is done to avoid confusion when working with a mixture of "active low" and "active high" signals. The term assert, or assertion, indicates that a signal is active, independent of whether that level is represented by a high or low voltage. The term negate, or negation, indicates that a signal is inactive.

 - CF UDMA Modes 0-4
 - CF PIO Modes 0-6
- Secure Digital 2.0
 - HS-SD and HC-SD
 - TransFlash™ and reduced form factor media
- MultiMediaCard 4.2

 - Memory Stick, MS Duo, HS-MS, MS Pro-HG, MS Pro
- Memory Stick Duo 1.10
- Smart Media 1.3
- xD-Picture Card 1.2

7.1.1 VBUS DETECT

According to Section 7.2.1 of the USB 2.0 Specification, a device cannot provide power to its D+ or D- pull-up resistors unless the upstream port's VBUS is in the asserted (powered) state. The VBUS_DET pin on the device monitors the state of the upstream VBUS signal and will not pull-up the D+ resistor if VBUS is not active. If VBUS goes from an active to an inactive state (not powered), the device will remove power from the D+ pull-up resistor within 10 seconds.

7.2 System Configurations

7.2.1 EEPROM

The USB2250/50i/51/51i can be configured via a 2-wire (I²C) EEPROM (512x8) flash device containing the options for the USB2250/50i/51/51i. If an external configuration device does not exist the internal default values will be used. If one of the external devices is used for configuration, the OEM can update the values through the USB interface. The device will then "attach" to the upstream USB host.

The USBDM tool set is available in the USB225x Card Reader software release package. To download the software package from Microchip's website, please visit:

<http://www.microchip.com/SWLibraryWeb/producttc.aspx?product=OBJ%20files%20for%20USB2250>

to go to the OBJ Card Reader Software Download Agreement. Review the license, and if you agree, check the "I agree" box and then select "Confirm". You will then be able to download the USB225x Card reader combo release package zip files containing the USBDM tool set. Please note that the following applies to the system values and descriptions when used:

- N/A = Not applicable to this part
- Reserved = For internal use

7.2.4 A0H-A7H: DEVICE POWER CONFIGURATION

The USB2250/50i/51/51i has four internal FETs which can be utilized for card power. This section describes the default internal configuration. The settings are stored in NVSTORE and provide the following features:

1. A card can be powered by an external FET or by an internal FET.
2. The power limit can be set to 100 mA or 200 mA (Default) for the internal FET.

Each media uses two bytes to store its device power configuration. Bit 3 selects between internal or external card power FET options. For internal FET card power control, bits 0 through 2 are used to set the power limit. The "Device Power Configuration" bits are ignored unless the "Enable Device Power Configuration" bit is set. See [Section 7.2.3.19, "9Ch-9Fh: Attribute Byte Descriptions," on page 26](#).

7.2.4.5 A8h: LED Blink Interval

Byte	Name	Description
0	LED_BLK_INT	The blink rate is programmable in 50 ms intervals. The high bit (7) indicates an idle state: '0' - Off '1' - On The remaining bits (6:0) are used to determine the blink interval up to a max of 63 x 50 ms.

7.2.4.6 A9h: LED Blink Duration

Byte	Name	Description
1	LED_BLK_DUR	LED Blink After Access. This byte is used to designate the number of seconds that the LED will continue to blink after a drive access. Setting this byte to "05" will cause the LED to blink for 5 seconds after a drive access.

7.2.5 DEVICE ID STRINGS

These bytes are used to specify the LUN descriptor returned by the device. These bytes are used in combination with the device to LUN mapping bytes in applications where the OEM wishes to reorder and rename the LUNs. If multiple devices are mapped to the same LUN (a COMBO LUN), then the CLUN#_ID_STR will be used to name the COMBO LUN instead of the individual device strings. When applicable, the "SM" value will be overridden with xD once an xD-Picture Card has been identified.

7.2.5.1 AAh-B0h: Device 0 Identifier String

Byte	Name	Description
6:0	DEV0_ID_STR	Not applicable.

7.2.5.2 B1h-B7h: Device 1 Identifier String

Byte	Name	Description
6:0	DEV1_ID_STR	This ID string is associated with the Memory Stick device.

7.2.5.3 B8h-BEh: Device 2 Identifier String

Byte	Name	Description
6:0	DEV2_ID_STR	This ID string is associated with the Smart Media device.

7.2.5.4 BFh-C5h: Device 3 Identifier String

Byte	Name	Description
6:0	DEV3_ID_STR	This ID string is associated with the Secure Digital / MultiMediaCard device.

7.2.5.5 C6h-CDh: Inquiry Vendor String

Byte	Name	Description
7:0	INQ_VEN_STR	If bit 4 of the 1st attribute byte is set, the device will use these strings in response to a USB inquiry command, instead of the USB descriptor manufacturer and product ID strings.

7.2.5.6 CEh-D2h: Inquiry Product String

Byte	Name	Description
4:0	INQ_PRD_STR	If bit 4 of the 1st attribute byte is set, the device will use these strings in response to a USB inquiry command, instead of the USB descriptor manufacturer and product ID strings.

7.2.5.7 D3h: Dynamic Number of LUNs

Byte	Name	Description
7:0	DYN_NUM_LUN	<p>These bytes are used to specify the number of LUNs the device exposes to the host. These bytes are also used for icon sharing by assigning more than one LUN to a single icon. This is used in applications where the device utilizes a combo socket and the OEM wishes to have only a single icon displayed for one or more interfaces.</p> <p>If this field is set to "FF", the program assumes that you are using the default value and icons will be configured per the default configuration.</p>

7.2.5.8 D4h-D7h: Device to LUN Mapping

Byte	Name	Description
3:0	DEV_LUN_MAP	<p>These registers map a device controller (SD/MMC, SM, and MS) to a Logical Unit Number (LUN). The device reports the mapped LUNs to the USB host in the USB descriptor during enumeration. The icon installer associates custom icons with the LUNs specified in these fields.</p> <p>Setting a register to "FF" indicates that the device is not mapped. Setting all of the DEV_LUN_MAP registers for all devices to "FF" forces the use of the default mapping configuration. Not all configurations are valid. Valid configurations depend on the hardware, packaging, and OEM board layout. The number of unique LUNs mapped must match the value in the Section 7.2.5.7, "D3h: Dynamic Number of LUNs," on page 29.</p>

7.2.5.9 D8h-FBh: Not Applicable

Byte	Name	Description
35:0	Not Applicable	Not Applicable.

7.2.5.10 FCh-FFh: Non-Volatile Storage Signature

Byte	Name	Description
3:0	NVSTORE_SIG	This signature is used to verify the validity of the data in the first 256 bytes of the configuration area. The signature must be set to 'ATA2' for USB2250/50i/51/51i.

USB2250/50i/51/51i

7.3 Default Configuration Option

The Microchip device can be configured via its internal default configuration. Please see [Section 7.2.2, "EEPROM Data Descriptor"](#) for specific details on how to enable default configuration. Please refer to [Table 7-1](#) for the internal default values that are loaded when this option is selected.

7.3.1 EXTERNAL HARDWARE NRESET

A valid hardware reset is defined as assertion of nRESET for a minimum of 1 μ s after all power supplies are within operating range. While reset is asserted, the device (and its associated external circuitry) consumes less than 500 μ A of current.

Assertion of nRESET (external pin) causes the following:

- 1. The PHY is disabled and the differential pair will be in a high-impedance state.
- 2. All transactions immediately terminate; no states are saved.
- 3. All internal registers return to the default state.
- 4. The external crystal oscillator is halted.
- 5. The PLL is halted.
- 6. The processor is reset.
- 7. All media interfaces are reset.

7.3.1.1 nRESET for EEPROM Configuration

FIGURE 7-1: NRESET TIMING FOR EEPROM MODE

TABLE 7-2: NRESET TIMING FOR EEPROM MODE

Name	Description	MIN	TYP	MAX	Units
t1	nRESET asserted	1			μ sec
t2	Device recovery/stabilization			500	μ sec
t3	8051 programs device configuration		20	50	msec
t4	USB attach			100	msec
t5	Host acknowledges attach and signals USB reset	100			msec
t6	USB idle		Undefined		msec
t7	Ready to handle requests (with or without data)			5	msec

Note: All power supplies must have reached the operating levels mandated in [Section 9.0, "DC Parameters"](#), prior to (or coincident with) the assertion of nRESET.

7.3.2 USB BUS RESET

In response to the upstream port signaling a reset to the device, the device does the following:

1. Sets default address to '0'.
2. Sets configuration to: Unconfigured.
3. All transactions are stopped.
4. Processor reinitializes and restarts.
5. All media interfaces are disabled.

C_S	Stray capacitance	Microchip IC and OEM board design
C_{XTAL}	XTAL pin input capacitance	Microchip IC
C_1 C_2	Load capacitors installed on OEM board	Calculated values based on Figure 8-2, "Capacitance Formulas" (See Note 8-2)

FIGURE 8-2: CAPACITANCE FORMULAS

$$C_1 = 2 \times (C_L - C_0) - C_{S1}$$

$$C_2 = 2 \times (C_L - C_0) - C_{S2}$$

Note 8-1 C_0 is usually included (subtracted by the crystal manufacturer) in the specification for C_L and should be set to '0' for use in the calculation of the capacitance formulas in [Figure 8-2, "Capacitance Formulas"](#). However, the OEM PCB itself may present a parasitic capacitance between XTAL1 and XTAL2. For an accurate calculation of C_1 and C_2 , take the parasitic capacitance between traces XTAL1 and XTAL2 into account.

Note 8-2 Each of these capacitance values is typically approximately 18 pF.

Voltage on USB+ and USB- pins		-0.5	$(3.3 \text{ V supply voltage} + 2) \leq 6$	V	
Voltage on CRD_PWR0, CRD_PWR1, CRD_PWR2 and CRD_PWR3		-0.5	$V_{DD33} + 0.3$	V	When internal power FET operation of these pins are enabled, these pins may be simultaneously shorted to ground or any voltage up to 3.63 V indefinitely, without damage to the device as long as V_{DD33} is less than 3.63 V and T_A is less than 70°C.
Voltage on any signal pin		-0.5	$V_{DD33} + 0.3$	V	
Voltage on XTAL1		-0.5	3.6	V	
Voltage on XTAL2		-0.5	$V_{DD18} + 0.3$	V	

Note 9-1 Stresses above the specified parameters may cause permanent damage to the device. This is a stress rating only and functional operation of the device at any condition above those indicated in the operation sections of this specification is not implied.

Note 9-2 When powering this device from laboratory or system power supplies, it is important that the absolute maximum ratings not be exceeded or device failure can result. Some power supplies exhibit voltage spikes on their outputs when the AC power is switched on or off. In addition, voltage transients on the AC power line may appear on the DC output. When this possibility exists, it is suggested that a clamp circuit be used.

FIGURE 9-1: SUPPLY RISE TIME MODEL

USB2250/50i/51/51i

Note 9-3 When powering the device, the maximum power supply ramp time should be set at a rate faster than 400 μ s. This speed is important to ensure that the device resets properly. Measure rise time at 10% and 90%.

9.2 Operating Conditions

3.3 V supply voltage	V_{DD33}	3.0	3.6	V	(Note 9-4)
3.3 V supply rise time	t_{RT}	0	400	μs	(See Figure 9-1 and Note 9-3)
Voltage on USB+ and USB- pins		-0.3	5.5	V	If any 3.3 V supply voltage drops below 3.0 V, then the MAX becomes: (3.3 V supply voltage) + 0.5 \leq 5.5
Voltage on any signal pin		-0.3	V_{DD33}	V	
Voltage on XTAL1		-0.3	V_{DD33}	V	
Voltage on XTAL2		-0.3	V_{DD18}	V	

Note 9-4 A 3.3 V regulator with an output tolerance of 1% must be used if the output of the internal power FET's must support a 5% tolerance.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
