Hex D-Type Flip-Flop with Master Reset

November 1988

Revised October 2000

Features

- I_{CC} reduced by 50%
- Outputs source/sink 24 mA
- ACT174 has TTL-compatible inputs

Ordering Code:

flops.

FAIRCHILD

SEMICONDUCTOR

General Description

74AC174 • 74ACT174

The AC/ACT174 is a high-speed hex D-type flip-flop. The

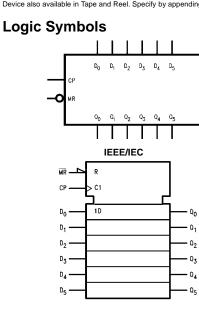

device is used primarily as a 6-bit edge-triggered storage

register. The information on the D inputs is transferred to

storage during the LOW-to-HIGH clock transition. The device has a Master Reset to simultaneously clear all flip-

Functional Description

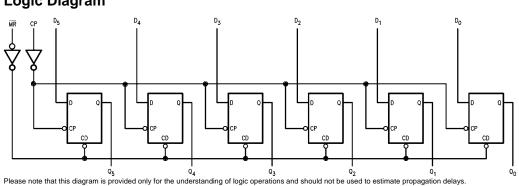

The AC/ACT174 consists of six edge-triggered D-type flipflops with individual D inputs and Q outputs. The Clock (CP) and Master Reset (\overline{MR}) are common to all flip-flops. Each D input's state is transferred to the corresponding flipflop's output following the LOW-to-HIGH Clock (CP) transition. A LOW input to the Master Reset (\overline{MR}) will force all outputs LOW independent of Clock or Data inputs. The AC/ ACT174 is useful for applications where the true output only is required and the Clock and Master Reset are common to all storage elements.
