

## 1. Pin Configurations

Figure 1-1. MLF/ Pinout ATmega329P

Note: The large center pad underneath the QFN/MLF packages is made of metal and internally connected to GND. It should be soldered or glued to the board to ensure good mechanical stability. If the center pad is left unconnected, the package might loosen from the board.

**Figure 1-2.** TQFP / Pinout ATmega3290P

## 2. Overview

The ATmega329P/3290P is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega329P/3290P achieves throughputs approaching 1MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

### 2.1 Block Diagram

Figure 2-1. Block Diagram

The Atmel® AVR® core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The

resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmel®AVR® ATmega329P/3290P provides the following features: 32K bytes of In-System Programmable Flash with Read-While-Write capabilities, 1Kbytes EEPROM, 2Kbyte SRAM, 54/69 general purpose I/O lines, 32 general purpose working registers, a JTAG interface for Boundary-scan, On-chip Debugging support and programming, a complete On-chip LCD controller with internal contrast control, three flexible Timer/Counters with compare modes, internal and external interrupts, a serial programmable USART, Universal Serial Interface with Start Condition Detector, an 8-channel, 10-bit ADC, a programmable Watchdog Timer with internal Oscillator, an SPI serial port, and five software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or hardware reset. In Power-save mode, the asynchronous timer and the LCD controller continues to run, allowing the user to maintain a timer base and operate the LCD display while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except asynchronous timer, LCD controller and ADC, to minimize switching noise during ADC conversions. In Standby mode, the crystal/resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low-power consumption.

The device is manufactured using Atmel's high density non-volatile memory technology. The On-chip In-System re-Programmable (ISP) Flash allows the program memory to be reprogrammed In-System through an SPI serial interface, by a conventional non-volatile memory programmer, or by an On-chip Boot program running on the AVR core. The Boot program can use any interface to download the application program in the Application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATmega329P/3290P is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATmega329P/3290P AVR is supported with a full suite of program and system development tools including: C Compilers, Macro Assemblers, Program Debugger/Simulators, In-Circuit Emulators, and Evaluation kits.

## 2.2 Comparison between ATmega329P, and ATmega3290P.

The ATmega329P, and ATmega3290P differ only in pin count and pinout. [Table 2-1 on page 5](#) summarizes the different configurations for the four devices.

**Table 2-1.** Configuration Summary

| Device      | Flash    | EEPROM  | RAM     | LCD Segments | General Purpose I/O Pins |
|-------------|----------|---------|---------|--------------|--------------------------|
| ATmega329P  | 32Kbytes | 1Kbytes | 2Kbytes | 4 x 25       | 54                       |
| ATmega3290P | 32Kbytes | 1Kbytes | 2Kbytes | 4 x 40       | 69                       |

## **2.3 Pin Descriptions**

The following section describes the I/O-pin special functions.

### **2.3.1 $V_{CC}$**

Digital supply voltage.

### **2.3.2 GND**

Ground.

### **2.3.3 Port A (PA7...PA0)**

Port A is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port A also serves the functions of various special features of the ATmega329P/3290P as listed on [page 71](#).

### **2.3.4 Port B (PB7...PB0)**

Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B has better driving capabilities than the other ports.

Port B also serves the functions of various special features of the ATmega329P/3290P as listed on [page 72](#).

### **2.3.5 Port C (PC7...PC0)**

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port C also serves the functions of special features of the ATmega329P/3290P as listed on [page 75](#).

### **2.3.6 Port D (PD7...PD0)**

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the ATmega329P/3290P as listed on [page 76](#).

### **2.3.7 Port E (PE7...PE0)**

Port E is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port E also serves the functions of various special features of the ATmega329P/3290P as listed on [page 78](#).

### **2.3.8 Port F (PF7...PF0)**

Port F serves as the analog inputs to the A/D Converter.

Port F also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port F output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port F pins that are externally pulled low will source current if the pull-up resistors are activated. The Port F pins are tri-stated when a reset condition becomes active, even if the clock is not running. If the JTAG interface is enabled, the pull-up resistors on pins PF7(TDI), PF5(TMS), and PF4(TCK) will be activated even if a reset occurs.

Port F also serves the functions of the JTAG interface.

### **2.3.9 Port G (PG5...PG0)**

Port G is a 6-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port G output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port G pins that are externally pulled low will source current if the pull-up resistors are activated. The Port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port G also serves the functions of various special features of the ATmega329P/3290P as listed on [page 82](#).

### **2.3.10 Port H (PH7...PH0)**

Port H is a 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port H output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port H pins that are externally pulled low will source current if the pull-up resistors are activated. The Port H pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port H also serves the functions of various special features of the ATmega3290P as listed on [page 84](#).

### **2.3.11 Port J (PJ6...PJ0)**

Port J is a 7-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port J output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port J pins that are externally pulled low will source current if the pull-up resistors are activated. The Port J pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port J also serves the functions of various special features of the ATmega3290P as listed on [page 87](#).

**2.3.12    RESET**

Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in "[System and Reset Characteristics](#)" on page 336. Shorter pulses are not guaranteed to generate a reset.

**2.3.13    XTAL1**

Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.

**2.3.14    XTAL2**

Output from the inverting Oscillator amplifier.

**2.3.15    AVCC**

AVCC is the supply voltage pin for Port F and the A/D Converter. It should be externally connected to  $V_{CC}$ , even if the ADC is not used. If the ADC is used, it should be connected to  $V_{CC}$  through a low-pass filter.

**2.3.16    AREF**

This is the analog reference pin for the A/D Converter.

**2.3.17    LCDCAP**

An external capacitor (typical  $> 470\text{nF}$ ) must be connected to the LCDCAP pin as shown in [Figure 23-2](#), if the LCD module is enabled and configured to use internal power. This capacitor acts as a reservoir for LCD power ( $V_{LCD}$ ). A large capacitance reduces ripple on  $V_{LCD}$  but increases the time until  $V_{LCD}$  reaches its target value.

### **3. Resources**

A comprehensive set of development tools, application notes and datasheets are available for download on <http://www.atmel.com/avr>.

### **4. Data Retention**

Reliability Qualification results show that the projected data retention failure rate is much less than 1 PPM over 20 years at 85°C or 100 years at 25°C.

### **5. About Code Examples**

This documentation contains simple code examples that briefly show how to use various parts of the device. These code examples assume that the part specific header file is included before compilation. Be aware that not all C compiler vendors include bit definitions in the header files and interrupt handling in C is compiler dependent. Please confirm with the C compiler documentation for more details.

For I/O Registers located in extended I/O map, “IN”, “OUT”, “SBIS”, “SBIC”, “CBI”, and “SBI” instructions must be replaced with instructions that allow access to extended I/O. Typically “LDS” and “STS” combined with “SBR”, “SBRC”, “SBR”, and “CBR”.

## 6. Register Summary

Note: Registers with bold type only available in ATmega3290P.

| Address | Name           | Bit 7                          | Bit 6         | Bit 5         | Bit 4         | Bit 3          | Bit 2         | Bit 1         | Bit 0         | Page |

- Notes:
- For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
  - I/O Registers within the address range 0x00 - 0x1F are directly bit-accessible using the SBI and CBI instructions. In these registers, the value of single bits can be checked by using the SBIS and SBIC instructions.
  - Some of the Status Flags are cleared by writing a logical one to them. Note that, unlike most other AVRs, the CBI and SBI instructions will only operate on the specified bit, and can therefore be used on registers containing such Status Flags. The CBI and SBI instructions work with registers 0x00 to 0x1F only.
  - When using the I/O specific commands IN and OUT, the I/O addresses 0x00 - 0x3F must be used. When addressing I/O Registers as data space using LD and ST instructions, 0x20 must be added to these addresses. The ATmega329P/3290P is a complex microcontroller with more peripheral units than can be supported within the 64 location reserved in Opcode for the IN and OUT instructions. For the Extended I/O space from 0x60 - 0xFF in SRAM, only the ST/STS/STD and LD/LDS/LDD instructions can be used.

## 7. Instruction Set Summary

| Mnemonics                                | Operands | Description                              | Operation                                             | Flags         | #Clocks |
|------------------------------------------|----------|------------------------------------------|-------------------------------------------------------|---------------|---------|
| <b>ARITHMETIC AND LOGIC INSTRUCTIONS</b> |          |                                          |                                                       |               |         |
| ADD                                      | Rd, Rr   | Add two Registers                        | $Rd \leftarrow Rd + Rr$                               | Z,C,N,V,H     | 1       |
| ADC                                      | Rd, Rr   | Add with Carry two Registers             | $Rd \leftarrow Rd + Rr + C$                           | Z,C,N,V,H     | 1       |
| ADIW                                     | Rdl, K   | Add Immediate to Word                    | $Rdh:Rdl \leftarrow Rdh:Rdl + K$                      | Z,C,N,V,S     | 2       |
| SUB                                      | Rd, Rr   | Subtract two Registers                   | $Rd \leftarrow Rd - Rr$                               | Z,C,N,V,H     | 1       |
| SUBI                                     | Rd, K    | Subtract Constant from Register          | $Rd \leftarrow Rd - K$                                | Z,C,N,V,H     | 1       |
| SBC                                      | Rd, Rr   | Subtract with Carry two Registers        | $Rd \leftarrow Rd - Rr - C$                           | Z,C,N,V,H     | 1       |
| SBCI                                     | Rd, K    | Subtract with Carry Constant from Reg.   | $Rd \leftarrow Rd - K - C$                            | Z,C,N,V,H     | 1       |
| SBIW                                     | Rdl, K   | Subtract Immediate from Word             | $Rdh:Rdl \leftarrow Rdh:Rdl - K$                      | Z,C,N,V,S     | 2       |
| AND                                      | Rd, Rr   | Logical AND Registers                    | $Rd \leftarrow Rd \bullet Rr$                         | Z,N,V         | 1       |
| ANDI                                     | Rd, K    | Logical AND Register and Constant        | $Rd \leftarrow Rd \bullet K$                          | Z,N,V         | 1       |
| OR                                       | Rd, Rr   | Logical OR Registers                     | $Rd \leftarrow Rd \vee Rr$                            | Z,N,V         | 1       |
| ORI                                      | Rd, K    | Logical OR Register and Constant         | $Rd \leftarrow Rd \vee K$                             | Z,N,V         | 1       |
| EOR                                      | Rd, Rr   | Exclusive OR Registers                   | $Rd \leftarrow Rd \oplus Rr$                          | Z,N,V         | 1       |
| COM                                      | Rd       | One's Complement                         | $Rd \leftarrow 0xFF - Rd$                             | Z,C,N,V       | 1       |
| NEG                                      | Rd       | Two's Complement                         | $Rd \leftarrow 0x00 - Rd$                             | Z,C,N,V,H     | 1       |
| SBR                                      | Rd, K    | Set Bit(s) in Register                   | $Rd \leftarrow Rd \vee K$                             | Z,N,V         | 1       |
| CBR                                      | Rd, K    | Clear Bit(s) in Register                 | $Rd \leftarrow Rd \bullet (0xFF - K)$                 | Z,N,V         | 1       |

|--------|----------|-------|-------|--------|
| A      | –        | –     | 1.20  |        |
| A1     | 0.05     | –     | 0.15  |        |
| A2     | 0.95     | 1.00  | 1.05  |        |
| D      | 15.75    | 16.00 | 16.25 |        |
| D1     | 13.90    | 14.00 | 14.10 | Note 2 |
| E      | 15.75    | 16.00 | 16.25 |        |
| E1     | 13.90    | 14.00 | 14.10 | Note 2 |
| B      | 0.30–    | 0.45  |       |        |
| C      | 0.09     | –     | 0.20  |        |
| L      | 0.45     | –     | 0.75  |        |
| e      | 0.80 TYP |       |       |        |

Notes:

1. This package conforms to JEDEC reference MS-026, Variation AEB.
2. Dimensions D1 and E1 do not include mold protrusion. Allowable protrusion is 0.25mm per side. Dimensions D1 and E1 are maximum plastic body size dimensions including mold mismatch.
3. Lead coplanarity is 0.10mm maximum.

## 10. Errata

### 10.1 ATmega329P rev. A

- Interrupts may be lost when writing the timer registers in the asynchronous timer
- Using BOD disable will make the chip reset

#### 1. Interrupts may be lost when writing the timer registers in the asynchronous timer

The interrupt will be lost if a timer register that is synchronous timer clock is written when the asynchronous Timer/Counter register (TCNTx) is 0x00.

##### Problem Fix/ Workaround

Always check that the asynchronous Timer/Counter register neither have the value 0xFF nor 0x00 before writing to the asynchronous Timer Control Register (TCCRx), asynchronous Timer Counter Register (TCNTx), or asynchronous Output Compare Register (OCRx).

#### 2. Using BOD disable will make the chip reset

If the part enters sleep with the BOD turned off with the BOD disable option enabled, a BOD reset will be generated at wakeup and the chip will reset.

##### Problem Fix/Workaround

Do not use BOD disable

### 10.2 ATmega329P rev. B

- Interrupts may be lost when writing the timer registers in the asynchronous timer

#### 1. Interrupts may be lost when writing the timer registers in the asynchronous timer

The interrupt will be lost if a timer register that is synchronous timer clock is written when the asynchronous Timer/Counter register (TCNTx) is 0x00.

##### Problem Fix/ Workaround

Always check that the asynchronous Timer/Counter register neither have the value 0xFF nor 0x00 before writing to the asynchronous Timer Control Register (TCCRx), asynchronous Timer Counter Register (TCNTx), or asynchronous Output Compare Register (OCRx).

### 10.3 ATmega329P rev. C

- Interrupts may be lost when writing the timer registers in the asynchronous timer

#### 1. Interrupts may be lost when writing the timer registers in the asynchronous timer

The interrupt will be lost if a timer register that is synchronous timer clock is written when the asynchronous Timer/Counter register (TCNTx) is 0x00.

##### Problem Fix/ Workaround

Always check that the asynchronous Timer/Counter register neither have the value 0xFF nor 0x00 before writing to the asynchronous Timer Control Register (TCCRx), asynchronous Timer Counter Register (TCNTx), or asynchronous Output Compare Register (OCRx).

## 10.4 ATmega3290P rev. A

- Interrupts may be lost when writing the timer registers in the asynchronous timer
- Using BOD disable will make the chip reset

### 1. Interrupts may be lost when writing the timer registers in the asynchronous timer

The interrupt will be lost if a timer register that is synchronous timer clock is written when the asynchronous Timer/Counter register (TCNTx) is 0x00.

#### **Problem Fix/ Workaround**

Always check that the asynchronous Timer/Counter register neither have the value 0xFF nor 0x00 before writing to the asynchronous Timer Control Register (TCCRx), asynchronous Timer Counter Register (TCNTx), or asynchronous Output Compare Register (OCRx).

### 2. Using BOD disable will make the chip reset

If the part enters sleep with the BOD turned off with the BOD disable option enabled, a BOD reset will be generated at wakeup and the chip will reset.

#### **Problem Fix/Workaround**

Do not use BOD disable

## 10.5 ATmega3290P rev. B

- Interrupts may be lost when writing the timer registers in the asynchronous timer

### 1. Interrupts may be lost when writing the timer registers in the asynchronous timer

The interrupt will be lost if a timer register that is synchronous timer clock is written when the asynchronous Timer/Counter register (TCNTx) is 0x00.

#### **Problem Fix/ Workaround**

Always check that the asynchronous Timer/Counter register neither have the value 0xFF nor 0x00 before writing to the asynchronous Timer Control Register (TCCRx), asynchronous Timer Counter Register (TCNTx), or asynchronous Output Compare Register (OCRx).

## 10.6 ATmega3290P rev. C

- Interrupts may be lost when writing the timer registers in the asynchronous timer

### 1. Interrupts may be lost when writing the timer registers in the asynchronous timer

The interrupt will be lost if a timer register that is synchronous timer clock is written when the asynchronous Timer/Counter register (TCNTx) is 0x00.

#### **Problem Fix/ Workaround**

Always check that the asynchronous Timer/Counter register neither have the value 0xFF nor 0x00 before writing to the asynchronous Timer Control Register (TCCRx), asynchronous Timer Counter Register (TCNTx), or asynchronous Output Compare Register (OCRx).
