### 3.0 Functional Description

The ZL40201 is an LVPECL clock fan out buffer with two identical output clock drivers capable of operating at frequencies up to 750MHz.

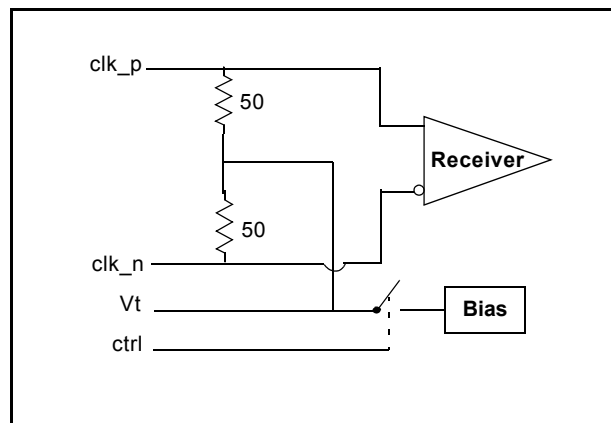

The ZL40201 provides an internal input termination network for DC and AC coupled inputs; optional input biasing for AC coupled inputs is also provided. The ZL40201 can accept DC or AC coupled LVPECL and LVDS input signals, AC coupled CML or HCSL input signals, and single ended signals. A pin compatible device with external termination is also available.

The ZL40201 is designed to fan out low-jitter reference clocks for wired or optical communications applications while adding minimal jitter to the clock signal. An internal linear power supply regulator and bulk capacitors minimize additive jitter due to power supply noise. The device operates from 2.5V+/-5% or 3.3V+/-5% supply. Its operation is guaranteed over the industrial temperature range -40°C to +85°C.

The device block diagram is shown in Figure 1; its operation is described in the following sections.

#### 3.1 Clock Inputs

The device has a differential input equipped with two on-chip 50 Ohm termination resistors arranged in series with a center tap. The input can accept many differential and single-ended signals with AC or DC coupling as appropriate. A control pin is available to enable internal biasing for AC coupled inputs. A block diagram of the input stage is in Figure 3.

**Figure 3 - Simplified Diagram of Input Stage**

The following figures give the components values and configuration for the various circuits compatible with the input stage and the use of the *Vt* and *ctrl* pins in each case.

In the following diagrams where the *ctrl* pin is "1" and the *Vt* pin is not connected, the *Vt* pin can be instead connected to  $V_{DD}$  with a capacitor. The same capacitor can also help in Figure 4 between *Vt* and  $V_{DD}$ . This capacitor will minimize the noise at the point between the two internal termination resistors and improve the overall performance of the device.

### 3.2 Clock Outputs

LVPECL has a very low output impedance and a differential signal swing between 1V and 1.6 V. A simplified diagram for the output stage is shown in Figure 12. The LVPECL to LVDS output termination is not shown since there is a different device with the same inputs and LVDS outputs.

**Figure 12 - Simplified Output Driver**

The methods to terminate the ZL40201 LVPECL drivers are shown in the following figures.

### 3.3 Device Additive Jitter

The ZL40201 clock fanout buffer is not intended to filter clock jitter. The jitter performance of this type of device is characterized by its additive jitter. Additive jitter is the jitter the device would add to a hypothetical jitter-free clock as it passes through the device. The additive jitter of the ZL40201 is random and as such it is not correlated to the jitter of the input clock signal.

The square of the resultant random RMS jitter at the output of the ZL40201 is equal to the sum of the squares of the various random RMS jitter sources including: input clock jitter; additive jitter of the buffer; and additive random jitter due to power supply noise. There may be additional deterministic jitter sources, but they are not shown in Figure 18.

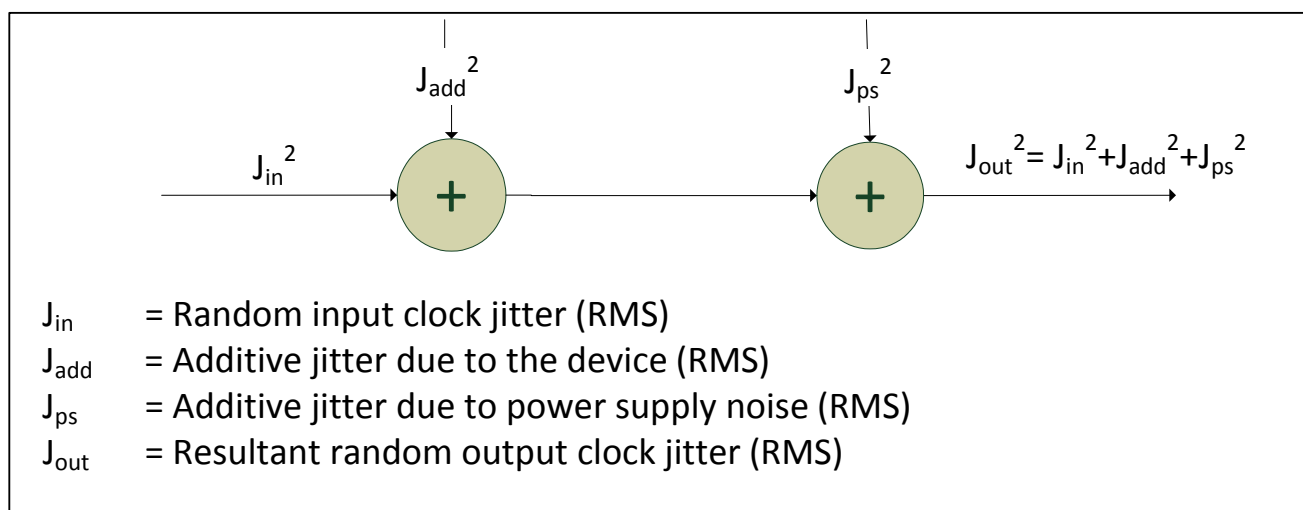

Figure 18 - Additive Jitter

### 3.4 Power Supply

This device operates with either a 2.5V supply or 3.3V supply.

#### 3.4.1 Sensitivity to power supply noise

Power supply noise from sources such as switching power supplies and high-power digital components such as FPGAs can induce additive jitter on clock buffer outputs. The ZL40201 is equipped with a low drop out (LDO) power regulator and on-chip bulk capacitors to minimize additive jitter due to power supply noise. The LDO regulator on the ZL40201 allows this device to have superior performance even in the presence of external noise sources. The on-chip regulation, recommended power supply filtering, and good PCB layout all work together to minimize the additive jitter from power supply noise.

The performance of these clock buffers in the presence of power supply noise is detailed in ZLAN-403, "Power Supply Rejection in Clock Buffers" which is available from Applications Engineering.

#### 3.4.2 Power supply filtering

For optimal jitter performance, the device should be isolated from the power planes connected to its power supply pins as shown in Figure 19.

- 10  $\mu$ F capacitors should be size 0603 or size 0805 X5R or X7R ceramic, 6.3 V minimum rating
- 0.1  $\mu$ F capacitors should be size 0402 X5R ceramic, 6.3 V minimum rating
- Capacitors should be placed next to the connected device power pins
- a 0.3 ohm resistor is recommended for the filter shown in Figure 19

Figure 19 - Decoupling Connections for Power Pins

#### 3.4.3 PCB layout considerations

The power nets in Figure 19 can be implemented either as a plane island or routed power topology without changing the overall jitter performance of the device.
