REVISION HISTORY

10/2017—Rev. G to Rev. H

Change to Figure 4	1
Changed 16-Lead LFCSP (CP-16-4) to 16-Lead LFCSP (CP-16-23), Table 3	4
Updated Outline Dimensions	13
Changes to Ordering Guide	13

3/2010—Rev. F to Rev. G

Changes to Figure 4	1
Changes to the Thermal Pad—AD8567 Section	10

1/2010—Rev. E to Rev. F

Changes to Applications and General Description Sections	1
Changes to Figure 4	1
Added Exposed Pad Notation to Outline Dimensions	12
Changes to Ordering Guide	13

8/2007—Rev. D to Rev. E

Changes to Features Section	1
Changes to Phase Margin	3
Changes to Table 2	4
Changes to Figure 30	10
Updated Outline Dimensions	12
Changes to Ordering Guide	13

Theory of Operation	9
Input Overvoltage Protection	9
Output Phase Reversal	10
Power Dissipation	10
Thermal Pad—AD8567	10
Total Harmonic Distortion + Noise (THD + N)	11
Short-Circuit Output Conditions	11
LCD Panel Applications	11
Outline Dimensions	12
Ordering Guide	13

2/2006—Rev. C to Rev. D

Updated Format	Universal
Changes to Figure 6 and Figure 8	5
Added the Thermal Pad—AD8567 Section	10
Changes to Ordering Guide	13

3/2004—Rev. B to Rev. C

Changes to Specifications	2
Changes to TPC 4	4
Changes to TPC 10	5
Changes to TPC 14	6
Changes to TPC 20	7

12/2003—Rev. A to Rev. B

Updated Ordering Guide	3
Updated Outline Dimensions	11

10/2001—Rev. 0 to Rev. A

Edit to 16-Lead CSP and 5-Lead SC70 Pin Configuration	1
Edit to Ordering Guide	3

7/2001—Revision 0: Initial Version

SPECIFICATIONS

ELECTRICAL CHARACTERISTICS

4.5 V ≤ V_S ≤ 16 V, V_{CM} = V_S/2, T_A = 25°C, unless otherwise noted.

Table 1.

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
INPUT CHARACTERISTICS						
Offset Voltage	V _{OS}			2	10	mV
Offset Voltage Drift	ΔV _{OS} /ΔT	−40°C ≤ T _A ≤ +85°C		5		μV/°C
Input Bias Current	I _B	−40°C ≤ T _A ≤ +85°C		80	600	nA
					800	nA
Input Offset Current	I _{OS}	−40°C ≤ T _A ≤ +85°C		1	80	nA
					130	nA
Input Voltage Range		Common-mode input	−0.5		V _S + 0.5	V
Common-Mode Rejection Ratio	CMRR	V _{CM} = 0 V to V _S , −40°C ≤ T _A ≤ +85°C	54	95		dB
Large Signal Voltage Gain	A _{VO}	R _L = 10 kΩ, V _O = 0.5 V to (V _S − 0.5 V)	3	10		V/mV
Input Impedance	Z _{IN}			400		kΩ
Input Capacitance	C _{IN}			1		pF
OUTPUT CHARACTERISTICS						
Output Voltage High	V _{OH}	I _L = 100 μA V _S = 16 V, I _L = 5 mA −40°C ≤ T _A ≤ +85°C	15.85	V _S − 0.005 15.95		V
		V _S = 4.5 V, I _L = 5 mA −40°C ≤ T _A ≤ +85°C	15.75			V
			4.2	4.38		V
			4.1			V
Output Voltage Low	V _{OL}	I _L = 100 μA V _S = 16 V, I _L = 5 mA −40°C ≤ T _A ≤ +85°C		5		mV
		V _S = 4.5 V, I _L = 5 mA −40°C ≤ T _A ≤ +85°C		42	150	mV
					250	mV
				95	300	mV
					400	mV
Continuous Output Current	I _{OUT}	−40°C ≤ T _A ≤ +85°C		35		mA
Peak Output Current	I _{PK}	V _S = 16 V		250		mA
POWER SUPPLY						
Supply Voltage	V _S		4.5		16	V
Power Supply Rejection Ratio	PSRR	V _S = 4 V to 17 V, −40°C ≤ T _A ≤ +85°C	70	90		dB
Supply Current/Amplifier	I _{SY}	V _O = V _S /2, no load −40°C ≤ T _A ≤ +85°C		700	850	μA
					1	mA
DYNAMIC PERFORMANCE						
Slew Rate	SR	R _L = 10 kΩ, C _L = 200 pF	4	6		V/μs
Gain Bandwidth Product	GBP	R _L = 10 kΩ, C _L = 10 pF		5		MHz
Phase Margin	∅ _m	R _L = 10 kΩ, C _L = 10 pF		65		Degrees
Channel Separation				75		dB
NOISE PERFORMANCE						
Voltage Noise Density	e _n	f = 1 kHz		26		nV/√Hz
	e _n	f = 10 kHz		25		nV/√Hz
Current Noise Density	i _n	f = 10 kHz		0.8		pA/√Hz

ABSOLUTE MAXIMUM RATINGS

Table 2.

Parameter	Rating
Supply Voltage (V_S)	18 V
Input Voltage	$-0.5\text{ V to }V_S + 0.5\text{ V}$
Differential Input Voltage	V_S
Storage Temperature Range	$-65^\circ\text{C to }+150^\circ\text{C}$
Operating Temperature Range	$-40^\circ\text{C to }+85^\circ\text{C}$
Junction Temperature Range	$-65^\circ\text{C to }+150^\circ\text{C}$
Lead Temperature (Soldering, 60 sec)	300°C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

THERMAL RESISTANCE

θ_{JA} is specified for worst-case conditions, that is, for a device soldered onto a circuit board for surface-mount packages.

Table 3. Thermal Resistance

Package Type	θ_{JA}	θ_{JC}	Unit
5-Lead SC70 (KS-5)	376	126	$^\circ\text{C/W}$
8-Lead MSOP (RM-8)	210	45	$^\circ\text{C/W}$
14-Lead TSSOP (RU-14)	180	35	$^\circ\text{C/W}$
16-Lead LFCSP (CP-16-23)	38 ¹	30 ¹	$^\circ\text{C/W}$

¹ DAP is soldered down to the printed circuit board (PCB).

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

THEORY OF OPERATION

The AD8565/AD8566/AD8567 are designed to drive large capacitive loads in LCD applications. They have high output current drive and rail-to-rail input/output operation and are powered from a single 16 V supply. They are also intended for other applications where low distortion and high output current drive are needed.

Figure 28 shows a simplified equivalent circuit for the AD8565/AD8566/AD8567. The rail-to-rail bipolar input stage is composed of two PNP differential pairs, Q4 to Q5 and Q10 to Q11, operating in series with diode protection networks, D1 to D2. Diode network D1 to D2 serves as protection against large transients for Q4 to Q5 to accommodate rail-to-rail input swing. D5 to D6 protect Q10 to Q11 against Zenering. In normal operation, Q10 to Q11 are off, and their input stage is buffered from the operational amplifier inputs by Q6 to D3 and Q8 to D4.

Operation of the input stage is best understood as a function of applied common-mode voltage: when the inputs of the AD8565/AD8566/AD8567 are biased midway between the supplies, the differential signal path gain is controlled by resistive loads Q4 to Q5 (via R9, R10). As the input common-mode level is reduced toward the negative supply (V_{NEG} or GND), the input transistor current sources, I1 and I2, are forced into saturation, thereby forcing the Q6 to D3 and Q8 to D4 networks into cutoff. However, Q4 to Q5 remain active, providing input stage gain.

Inversely, when common-mode input voltage is increased toward the positive supply, Q4 to Q5 are driven into cutoff, Q3 is driven into saturation, and Q4 becomes active, providing bias to the Q10 to Q11 differential pair. The point at which the Q10 to Q11 differential pair becomes active is approximately equal to ($V_{POS} - 1$ V).

Figure 28. AD8565/AD8566/AD8567 Equivalent Input Circuit

The benefit of this type of input stage is low bias current. The input bias current is the sum of base currents of Q4 to Q5 and Q6 to Q8 over the range from ($V_{NEG} + 1$ V) to ($V_{POS} - 1$ V). Outside this range, the input bias current is dominated by the sum of base currents of Q10 to Q11 for input signals close to V_{NEG} and of Q6 to Q8 (Q10 to Q11) for signals close to V_{POS} . From this type of design, the input bias current of the AD8565/AD8566/AD8567 not only exhibits different amplitude but also exhibits different polarities. Figure 29 provides the characteristics of the input bias current vs. the common-mode voltage. It is important to keep in mind that the source impedances driving the inputs are balanced for optimum dc and ac performance.

Figure 29. AD8565/AD8566/AD8567 Input Bias Current vs. Common-Mode Voltage

To achieve rail-to-rail output performance, the AD8565/AD8566/AD8567 design uses a complementary common-source (or gmRL) output. This configuration allows output voltages to approach the power supply rails, particularly if the output transistors are allowed to enter the triode region on extremes of signal swing, which are limited by V_{GS} , the transistor sizes, and output load current. In addition, this type of output stage exhibits voltage gain in an open-loop gain configuration. The amount of gain depends on the total load resistance at the output of the AD8565/AD8566/AD8567.

INPUT OVERVOLTAGE PROTECTION

As with any semiconductor device, whenever the input exceeds either supply voltages, attention needs to be paid to the input overvoltage characteristics. As an overvoltage occurs, the amplifier could be damaged, depending on the voltage level and the magnitude of the fault current. When the input voltage exceeds either supply by more than 0.6 V, internal positive-negative (pn) junctions allow current to flow from the input to the supplies.

This input current is not inherently damaging to the device as long as it is limited to 5 mA or less. If a condition exists using the AD8565/AD8566/AD8567 where the input exceeds the supply more than 0.6 V, an external series resistor must be added. The size of the resistor can be calculated by using the maximum over-voltage divided by 5 mA. This resistance must be placed in series with either input exposed to an overvoltage.

OUTPUT PHASE REVERSAL

The AD8565/AD8566/AD8567 are immune to phase reversal. Although device output does not change phase, large currents due to input overvoltage could damage the device. In applications where the possibility of an input voltage exceeding the supply voltage exists, overvoltage protection must be used as described in the Input Overvoltage Protection section.

POWER DISSIPATION

The maximum allowable internal junction temperature of 150°C limits the maximum power dissipation of AD8565/AD8566/AD8567 devices. As the ambient temperature increases, the maximum power dissipated by AD8565/AD8566/AD8567 devices must decrease linearly to maintain maximum junction temperature. If this maximum junction temperature is exceeded momentarily, the device still operates properly once the junction temperature is reduced below 150°C. If the maximum junction temperature is exceeded for an extended period, overheating could lead to permanent damage of the device.

The maximum safe junction temperature, T_{JMAX} , is 150°C. Using the following formula, the maximum power that an AD8565/AD8566/AD8567 device can safely dissipate as a function of temperature can be obtained:

$$P_{DISS} = T_{JMAX} - T_A / \theta_{JA}$$

where:

P_{DISS} is the AD8565/AD8566/AD8567 power dissipation.

T_{JMAX} is the AD8565/AD8566/AD8567 maximum allowable junction temperature (150°C).

T_A is the ambient temperature of the circuit.

θ_{JA} is the AD8565/AD8566/AD8567 package thermal resistance, junction-to-ambient.

The power dissipated by the device can be calculated as

$$P_{DISS} = (V_S - V_{OUT}) \times I_{LOAD}$$

where:

V_S is the supply voltage.

V_{OUT} is the output voltage.

I_{LOAD} is the output load current.

Figure 30 shows the maximum power dissipation vs. temperature. To achieve proper operation, use the previous equation to calculate P_{DISS} for a specific package at any given temperature or use Figure 30.

Figure 30. Maximum Power Dissipation vs. Temperature for 5-Lead SC70, 8-Lead MSOP, 14-Lead TSSOP, and 16-Lead LFCSP Packages

THERMAL PAD—AD8567

The AD8567 LFCSP comes with a thermal pad that is attached to the substrate. This substrate is connected to the most positive supply, that is, Pin 3 in the LFCSP package and Pin 4 in the TSSOP package. To be electrically safe, the thermal pad must be soldered to an area on the board that is electrically isolated or connected to V_{DD} . Attaching the thermal pad to ground adversely affects the performance of the part.

Soldering down this thermal pad dramatically improves the heat dissipation of the package. It is necessary to attach vias that connect the soldered thermal pad to another layer on the board. This provides an avenue to dissipate the heat away from the part. Without vias, the heat is isolated directly under the part.
