

## 2. Pin configurations

| Pin name         | Function       |
|------------------|----------------|
| A0 - A17         | Addresses      |
| O0 - O7          | Outputs        |
| $\overline{CE}$  | Chip enable    |
| $\overline{OE}$  | Output enable  |
| $\overline{PGM}$ | Program strobe |

## 3. System considerations

Switching between active and standby conditions via the chip enable pin may produce transient voltage excursions. Unless accommodated by the system design, these transients may exceed datasheet limits, resulting in device nonconformance. At a minimum, a 0.1 $\mu$ F, high-frequency, low inherent inductance, ceramic capacitor should be utilized for each device. This capacitor should be connected between the  $V_{CC}$  and ground terminals of the device, as close to the device as possible. Additionally, to stabilize the supply voltage level on printed circuit boards with large EPROM arrays, a 4.7 $\mu$ F bulk electrolytic capacitor should be utilized, again connected between the  $V_{CC}$  and ground terminals. This capacitor should be positioned as close as possible to the point where the power supply is connected to the array.

Figure 3-1. Block diagram

#### 4. Absolute maximum ratings\*

|                                                             |                                |
|-------------------------------------------------------------|--------------------------------|
| Temperature under bias .....                                | -55°C to +125°C                |
| Storage temperature .....                                   | -65°C to +150°C                |
| Voltage on any pin with respect to ground .....             | -2.0V to +7.0V <sup>(1)</sup>  |
| Voltage on A9 with respect to ground .....                  | -2.0V to +14.0V <sup>(1)</sup> |
| V <sub>PP</sub> supply voltage with respect to ground ..... | -2.0V to +14.0V <sup>(1)</sup> |

\*NOTICE: Stresses beyond those listed under "Absolute maximum ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note: 1. Minimum voltage is -0.6V DC, which may undershoot to -2.0V for pulses of less than 20ns. Maximum output pin voltage is V<sub>CC</sub> + 0.75V DC, which may overshoot to +7.0V for pulses of less than 20ns.

#### 5. DC and AC characteristics

Table 5-1. Operating modes

| Mode/Pin                              | $\overline{CE}$ | $\overline{OE}$ | $\overline{PGM}$ | Ai                                                                                                          | V <sub>PP</sub> | Outputs             |
|---------------------------------------|-----------------|-----------------|------------------|-------------------------------------------------------------------------------------------------------------|-----------------|---------------------|

| Product identification <sup>(4)</sup> | V <sub>IL</sub> | V <sub>IL</sub> | X                | A9 = V <sub>H</sub> <sup>(3)</sup><br>A0 = V <sub>IH</sub> or V <sub>IL</sub><br>A1 - A17 = V <sub>IL</sub> | X               | Identification code |

Notes: 1. X can be V<sub>IL</sub> or V<sub>IH</sub>.  
 2. Refer to programming characteristics.  
 3. V<sub>H</sub> = 12.0 ± 0.5V.  
 4. Two identifier bytes may be selected. All Ai inputs are held low (V<sub>IL</sub>) except A9, which is set to V<sub>H</sub>, and A0, which is toggled low (V<sub>IL</sub>) to select the manufacturer's identification byte and high (V<sub>IH</sub>) to select the device code byte.

Table 5-2. DC and AC operating conditions for read operation

|                              |       | Atmel AT27C020 |               |
|------------------------------|-------|----------------|---------------|
|                              |       | -55            | -90           |
| Operating temperature (case) | Ind.  | -40°C - 85°C   | -40°C - 85°C  |
|                              | Auto. |                | -40°C - 125°C |
| V <sub>CC</sub> power supply |       | 5V ± 10%       | 5V ± 10%      |

Table 5-3. DC and operating characteristics for read operation

| Symbol         | Parameter                           | Condition                                                 | Min  | Max            | Units   |
|----------------|-------------------------------------|-----------------------------------------------------------|------|----------------|---------|
| $I_{LI}$       | Input load current                  | $V_{IN} = 0V$ to $V_{CC}$ (Com., Ind.)                    |      | $\pm 1.0$      | $\mu A$ |
| $I_{LO}$       | Output leakage current              | $V_{OUT} = 0V$ to $V_{CC}$ (Com., Ind.)                   |      | $\pm 5.0$      | $\mu A$ |
| $I_{PP}^{(2)}$ | $V_{PP}^{(1)}$ read/standby current | $V_{PP} = V_{CC}$                                         |      | $\pm 10$       | $\mu A$ |
| $I_{SB}$       | $V_{CC}^{(1)}$ standby current      | $I_{SB1}$ (CMOS), $\overline{CE} = V_{CC} \pm 0.3V$       |      | 100            | $\mu A$ |
|                |                                     | $I_{SB2}$ (TTL), $\overline{CE} = 2.0$ to $V_{CC} + 0.5V$ |      | 1.0            | mA      |
| $I_{CC}$       | $V_{CC}$ active current             | $f = 5MHz$ , $I_{OUT} = 0mA$ , $\overline{CE} = V_{IL}$   |      | 25             | mA      |
| $V_{IL}$       | Input low voltage                   |                                                           | -0.6 | 0.8            | V       |
| $V_{IH}$       | Input high voltage                  |                                                           | 2.0  | $V_{CC} + 0.5$ | V       |
| $V_{OL}$       | Output low voltage                  | $I_{OL} = 2.1mA$                                          |      | 0.4            | V       |
| $V_{OH}$       | Output high voltage                 | $I_{OH} = -400\mu A$                                      | 2.4  |                | V       |

- Notes: 1.  $V_{CC}$  must be applied simultaneously or before  $V_{PP}$ , and removed simultaneously or after  $V_{PP}$   
2.  $V_{PP}$  may be connected directly to  $V_{CC}$  except during programming. The supply current would then be the sum of  $I_{CC}$  and  $I_{PP}$ .

Table 5-4. AC characteristics for read operation

| Symbol                            | Parameter                                                                                  | Condition                                            | Atmel AT27C020 |     |     |     | Units |

| t <sub>OE</sub> <sup>(2)(3)</sup> | $\overline{OE}$ to output delay                                                            | $\overline{CE} = V_{IL}$                             |                | 20  |     | 35  | ns    |
| t <sub>DF</sub> <sup>(4)(5)</sup> | $\overline{OE}$ or $\overline{CE}$ high to output float,<br>Whichever occurred first       |                                                      |                | 18  |     | 20  | ns    |
| t <sub>OH</sub>                   | Output hold from address, $\overline{CE}$ or $\overline{OE}$ ,<br>Whichever occurred first |                                                      | 7              |     | 0   |     | ns    |

Figure 5-1. AC waveforms for read operation<sup>(1)</sup>

- Notes:
1. Timing measurement references are 0.8V and 2.0V. Input AC drive levels are 0.45V and 2.4V, unless otherwise specified.
  2.  $\overline{OE}$  may be delayed up to  $t_{CE} - t_{OE}$  after the falling edge of  $\overline{CE}$  without impact on  $t_{CE}$ .
  3.  $\overline{OE}$  may be delayed up to  $t_{ACC} - t_{OE}$  after the address is valid without impact on  $t_{ACC}$ .
  4. This parameter is only sampled, and is not 100% tested.
  5. Output float is defined as the point when data is no longer driven.

Figure 5-2. Input test waveforms and measurement levels

For -55 devices only:

$t_R, t_F < 5\text{ns}$  ( 10% to 90% )

For -90 devices only:

$t_R, t_F < 20\text{ns}$  ( 10% to 90% )

Figure 5-3. Output test load

Note: CL = 100pF including jig capacitance, except -55 devices, where CL = 30pF

Table 5-5. Pin capacitance

$f = 1\text{MHz}$ ,  $T = 25^\circ\text{C}$ <sup>(1)</sup>

| Symbol           | Typ | Max | Units | Conditions                   |
|------------------|-----|-----|-------|------------------------------|
| $C_{\text{IN}}$  | 4   | 8   | pF    | $V_{\text{IN}} = 0\text{V}$  |
| $C_{\text{OUT}}$ | 8   | 12  | pF    | $V_{\text{OUT}} = 0\text{V}$ |

Note: 1. Typical values for nominal supply voltage. This parameter is only sampled, and is not 100% tested.

Figure 5-4. Programming waveforms<sup>(1)</sup>

- Note:
1. The input timing reference is 0.8V for  $V_{\text{IL}}$  and 2.0V for  $V_{\text{IH}}$ .
  2.  $t_{\text{OE}}$  and  $t_{\text{DFP}}$  are characteristics of the device, but must be accommodated by the programmer.
  3. When programming the Atmel AT27C020, a 0.1 $\mu\text{F}$  capacitor is required across  $V_{\text{PP}}$  and ground to suppress voltage transients.

Table 5-6. DC programming characteristics

 $T_A = 25 \pm 5^\circ\text{C}$ ,  $V_{CC} = 6.5 \pm 0.25\text{V}$ ,  $V_{PP} = 13.0 \pm 0.25\text{V}$ 

| Symbol    | Parameter                                    | Test conditions                           | Limits |                | Units         |

| $t_{OE}$  | Data valid from $\overline{OE}$                           |                                                 |        | 150 | ns            |
| $t_{PRT}$ | $V_{PP}$ pulse rise time during programming               |                                                 | 50     |     | ns            |

- Notes:
1.  $V_{CC}$  must be applied simultaneously with or before  $V_{PP}$  and removed simultaneously with or after  $V_{PP}$ .
  2. This parameter is only sampled and is not 100% tested. Output float is defined as the point where data is no longer driven. See timing diagram.
  3. Program pulse width tolerance is  $100\mu\text{s} \pm 5\%$ .

Table 5-8. The Atmel AT27C020 integrated product identification code

| Codes        | Pins |    |    |    |    |    |    |    |    | Hex data |
|--------------|------|----|----|----|----|----|----|----|----|----------|
|              | A0   | O7 | O6 | O5 | O4 | O3 | O2 | O1 | O0 |          |
| Manufacturer | 0    | 0  | 0  | 0  | 1  | 1  | 1  | 1  | 0  | 1E       |
| Device type  | 1    | 1  | 0  | 0  | 0  | 0  | 1  | 1  | 0  | 86       |

## 6. Rapid programming algorithm

A  $100\mu\text{s}$   $\overline{\text{PGM}}$  pulse width is used to program. The address is set to the first location.  $V_{\text{CC}}$  is raised to 6.5V and  $V_{\text{PP}}$  is raised to 13.0V. Each address is first programmed with one  $100\mu\text{s}$   $\overline{\text{PGM}}$  pulse without verification. Then a verification/reprogramming loop is executed for each address. In the event a byte fails to pass verification, up to 10 successive  $100\mu\text{s}$  pulses are applied with a verification after each pulse. If the byte fails to verify after 10 pulses have been applied, the part is considered failed. After the byte verifies properly, the next address is selected until all have been checked.  $V_{\text{PP}}$  is then lowered to 5.0V and  $V_{\text{CC}}$  to 5.0V. All bytes are read again and compared with the original data to determine if the device passes or fails.

Figure 6-1. Rapid programming algorithm

| e      | 1.270 TYP |     |        |        |

- Notes:
1. This package conforms to JEDEC reference MS-016, Variation AE.
  2. Dimensions D1 and E1 do not include mold protrusion. Allowable protrusion is .010" (0.254mm) per side. Dimension D1 and E1 include mold mismatch and are measured at the extreme material condition at the upper or lower parting line.
  3. Lead coplanarity is 0.004" (0.10mm) maximum.
