8) Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

9) Short circuit current limit for max. duration of $t_{d(SC)} \text{ max} = 400\ \mu\text{s}$, prior to shutdown

10) While demagnetizing load inductance, dissipated energy in PROFET is $E_{AS} = \int V_{ON(CL)} * i_L(t) dt$, approx.
 $E_{AS} = \frac{1}{2} * L * I_L^2 * \left(\frac{V_{ON(CL)}}{V_{ON(CL)} - V_{bb}} \right)$, see diagram page 8.

11) Reverse load current (through intrinsic drain-source diode) is normally limited by the connected load. Reverse current I_{GND} of $\approx 0.3\text{ A}$ at $V_{bb} = -32\text{ V}$ through the logic heats up the device. Time allowed under these condition is dependent on the size of the heatsink. Reverse I_{GND} can be reduced by an additional external GND-resistor (150 Ω). Input and Status currents have to be limited (see max. ratings page 2 and circuit page 7).

Input circuit (ESD protection)

ZD11 6.1 V typ., ESD zener diodes are not to be used as voltage clamp at DC conditions. Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

13) Power Transistor off, high impedance

14) Low resistance short V_{bb} to output may be detected by no-load-detection

Status output

ESD-Zener diode: 6.1 V typ., max 5 mA;
 $R_{ST(ON)} < 250 \Omega$ at 1.6 mA, ESD zener diodes are not to be used as voltage clamp at DC conditions.
 Operation in this mode may result in a drift of the zener voltage (increase of up to 1 V).

Short Circuit detection

Fault Condition: $V_{ON} > 8.3 \text{ V typ.};$ IN high

GND disconnect

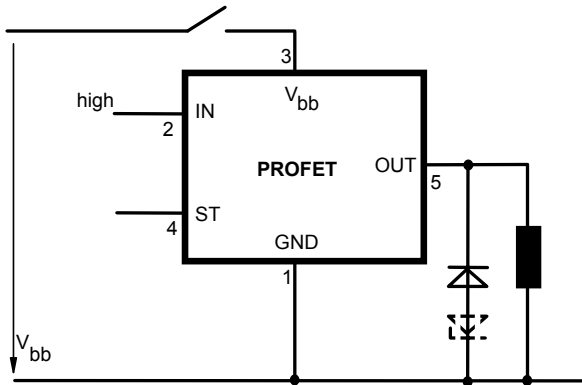

Any kind of load. In case of Input=high is $V_{OUT} \approx V_{IN} - V_{IN(T+)}$.
 Due to $V_{GND} > 0$, no $V_{ST} = \text{low}$ signal available.

GND disconnect with GND pull up

Any kind of load. If $V_{GND} > V_{IN} - V_{IN(T+)}$ device stays off
 Due to $V_{GND} > 0$, no $V_{ST} = \text{low signal}$ available.

Vbb disconnect with charged inductive load

Inductive Load switch-off energy dissipation

Energy dissipated in PROFET $E_{AS} = E_{bb} + E_L - E_R$.
 $E_{Load} < E_L$, $E_L = \frac{1}{2} * L * I_L^2$
