**Figure 3. REF. Input to CLKA/CLKB Delay vs. Loading Difference between CLKOUT and CLKA/CLKB Pins**

### Zero Delay and Skew Control

All outputs must be uniformly loaded to achieve zero delay between the input and output. Because the CLKOUT pin is the internal feedback to the PLL, its relative loading can adjust the input-output delay. This is shown in the above graph.

For applications requiring zero input-output delay, all outputs, including CLKOUT, must be equally loaded. Even if CLKOUT is not used, it must have a capacitive load, equal to that on other outputs, for obtaining zero input-output delay. If input to output delay adjustments are required, use [Figure 3](#) to calculate loading differences between the CLKOUT pin and other outputs.

For zero output-output skew, be sure to load all outputs equally. For further information, refer to the application note titled “[CY2305 and CY2309 as PCI and SDRAM Buffers](#).”

#### Notes

- Weak pull down on all outputs
- This output is driven and has an internal feedback for the PLL. The load on this output can be adjusted to change the skew between the reference and output.

## CY2305/CY2309 Qualification Status

Product Status: In production

Qualification report last updated on 11/27/2012 (<http://www.cypress.com/?rID=72595>)

### 1. Start up lock time issue

#### ■ Problem Definition

Output of CY2305/CY2309 fails to locks within 1 ms (as per data sheet spec)

#### ■ Parameters Affected

PLL lock time

#### ■ Trigger Condition(S)

Start up

#### ■ Scope of Impact

It can impact the performance of system and its throughput

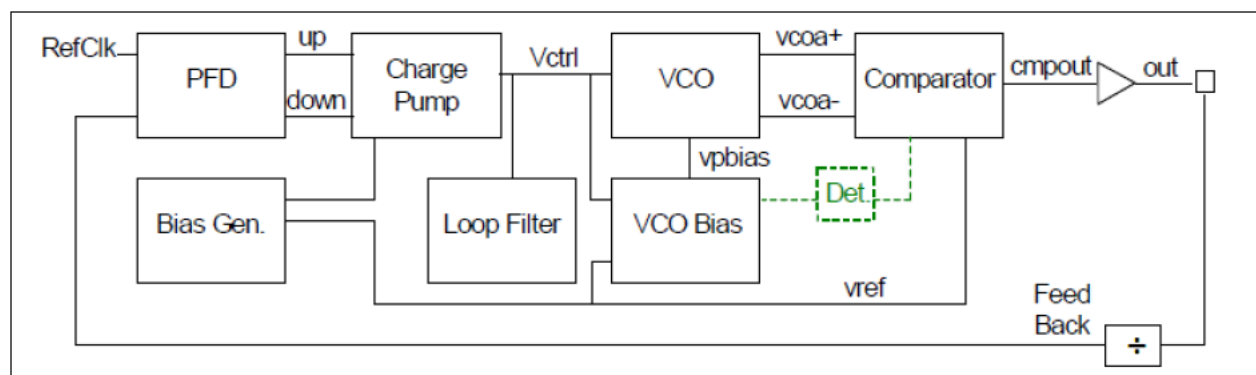

#### ■ Workaround

Apply reference input (RefClk) before power up (VDD) Input noise propagates to output due to absence of reference input signal during power up. If reference input is present during power up, the noise will not propagate to output and device will start normally without problems.

#### ■ Fix Status

This issue is due to design marginality. Two minor design modifications have been made to address this problem.

- Addition of VCO bias detector block as shown in the following figure which keeps comparator power down till VCO bias is present and thereby eliminating the propagation of noise to feedback.
- Bias generator enhancement for successful initialization.
