

## Features

- Single-chip 10Base-T/100Base-TX physical layer solution
- Fully compliant to IEEE 802.3u Standard
- Low power CMOS design, power consumption of <180mW
- HP auto MDI/MDI-X for reliable detection and correction for straight-through and crossover cables with disable and enable option
- Robust operation over standard cables
- LinkMD<sup>®</sup> TDR-based cable diagnostics for identification of faulty copper cabling
- Fiber support: 100Base-FX (KSZ8041FTL only),
- Back-to-Back mode support for 100Mbps repeater or media converter
- MII interface support
- RMII interface support with external 50MHz system clock (KSZ8041TL/FTL only)
- SMII interface support with external 125MHz system clock and 12.5MHz sync clock from MAC (KSZ8041TL/FTL only)
- MIIM (MDC/MDIO) management bus to 12.5MHz for rapid PHY register configuration
- Interrupt pin option
- Programmable LED outputs for link, activity and speed
- Power down and power saving modes
- Single power supply (3.3V)
- Built-in 1.8V regulator for core
- Available packages:
  - 48-pin LQFP (KSZ8041MLL)
  - 48-pin TQFP (KSZ8041TL/FTL)

## Applications

- Printer
- LOM
- Game Console
- IPTV
- IP Phone
- IP Set-top Box
- Media Converter

## Ordering Information

| Part Number (marking)      | Ordering Number | Temp. Range   | Package     | Lead Finish | Description                                   |
|----------------------------|-----------------|---------------|-------------|-------------|-----------------------------------------------|
| KSZ8041MLL                 | KSZ8041MLL      | 0°C to 70°C   | 48-Pin LQFP | Pb-Free     | MII, 10/100 Copper, C-Temp, 48-LQFP           |
| KSZ8041TL                  | KSZ8041TL       | 0°C to 70°C   | 48-Pin TQFP | Pb-Free     | MII / RMII, 10/100 Copper, C-Temp, 48-TQFP    |
| KSZ8041TLI <sup>(1)</sup>  | KSZ8041TLI      | -40°C to 85°C | 48-Pin TQFP | Pb-Free     | MII / RMII, 10/100 Copper, I-Temp, 48-TQFP    |
| KSZ8041FTL                 | KSZ8041FTL      | 0°C to 70°C   | 48-Pin TQFP | Pb-Free     | MII / RMII, 100Base-FX Fiber, C-Temp, 48-TQFP |
| KSZ8041FTLI <sup>(1)</sup> | KSZ8041FTLI     | -40°C to 85°C | 48-Pin TQFP | Pb-Free     | MII / RMII, 100Base-FX Fiber, I-Temp, 48-TQFP |
| KSZ8041TL <sup>(1)</sup>   | KSZ8041TL-S     | 0°C to 70°C   | 48-Pin TQFP | Pb-Free     | SMII, 10/100 Copper, C-Temp, 48-TQFP          |
| KSZ8041TLI <sup>(1)</sup>  | KSZ8041TLI-S    | -40°C to 85°C | 48-Pin TQFP | Pb-Free     | SMII, 10/100 Copper, I-Temp, 48-TQFP          |
| KSZ8041FTL <sup>(1)</sup>  | KSZ8041FTL-S    | 0°C to 70°C   | 48-Pin TQFP | Pb-Free     | SMII, 100Base-FX Fiber, C-Temp, 48-TQFP       |
| KSZ8041FTLI <sup>(1)</sup> | KSZ8041FTLI-S   | -40°C to 85°C | 48-Pin TQFP | Pb-Free     | SMII, 100Base-FX Fiber, I-Temp, 48-TQFP       |

| 48<br>(KSZ8041FTL) | FXSD /<br>FXEN | lpd                 | FXSD: Signal Detect for 100Base-FX fiber mode<br>FXEN: Fiber Enable for 100Base-FX fiber mode<br>If FXEN=0, fiber mode is disabled. PHY is in copper mode. The default is "0".<br>See "100Base-FX Operation" section for details. |

**Notes:**

1. P = Power supply.  
Gnd = Ground.  
I = Input.  
O = Output.  
I/O = Bi-directional.  
lpd = Input with internal pull-down (40K +/-30%).  
lpu = Input with internal pull-up (40K +/-30%).  
Opu = Output with internal pull-up (40K +/-30%).  
lpu/O = Input with internal pull-up (40K +/-30%) during power-up/reset; output pin otherwise.  
lpd/O = Input with internal pull-down (40K +/-30%) during power-up/reset; output pin otherwise.
2. MII Rx Mode: The RXD[3..0] bits are synchronous with RXCLK. When RXDV is asserted, RXD[3..0] presents valid data to MAC through the MII. RXD[3..0] is invalid when RXDV is de-asserted.
3. RMII Rx Mode: The RXD[1:0] bits are synchronous with REF\_CLK. For each clock period in which CRS\_DV is asserted, two bits of recovered data are sent from the PHY.
4. SMII Rx Mode: Receive data and control information are sent in 10 bit segments. In 100MBit mode, each segment represents a new byte of data. In 10MBit mode, each segment is repeated ten times; therefore, every ten segments represent a new byte of data. The MAC can sample any one of every 10 segments in 10MBit mode.
5. MII Tx Mode: The TXD[3..0] bits are synchronous with TXCLK. When TXEN is asserted, TXD[3..0] presents valid data from the MAC through the MII. TXD[3..0] has no effect when TXEN is de-asserted.
6. RMII Tx Mode: The TXD[1:0] bits are synchronous with REF\_CLK. For each clock period in which TX\_EN is asserted, two bits of data are received by the PHY from the MAC.
7. SMII Tx Mode: Transmit data and control information are received in 10 bit segments. In 100MBit mode, each segment represents a new byte of data. In 10MBit mode, each segment is repeated ten times; therefore, every ten segments represent a new byte of data. The PHY can sample any one of every 10 segments in 10MBit mode.

|                    |          |                     | If fiber mode (FXEN=1), this pin configuration is always strapped to disable Auto-Negotiation.                                                                                                                                               |

**Note:**

1. Ipu/O = Input with internal pull-up (40K +/-30%) during power-up/reset; output pin otherwise.  
Ipd/O = Input with internal pull-down (40K +/-30%) during power-up/reset; output pin otherwise.

Pin strap-ins are latched during power-up or reset. In some systems, the MAC receive input pins may drive high during power-up or reset, and consequently cause the PHY strap-in pins on the MII/RMII/SMII signals to be latched high. In this case, it is recommended to add 1K pull-downs on these PHY strap-in pins to ensure the PHY does not strap-in to ISOLATE mode, or is not configured with an incorrect PHY Address.

**Notes:**

- P = Power supply.  
 Gnd = Ground.  
 I = Input.  
 O = Output.  
 I/O = Bi-directional.  
 Ipd = Input with internal pull-down (40K +/-30%).  
 Ipu = Input with internal pull-up (40K +/-30%).  
 Opu = Output with internal pull-up (40K +/-30%).  
 Ipu/O = Input with internal pull-up (40K +/-30%) during power-up/reset; output pin otherwise.  
 Ipd/O = Input with internal pull-down (40K +/-30%) during power-up/reset; output pin otherwise.
- MII Rx Mode: The RXD[3..0] bits are synchronous with RXCLK. When RXDV is asserted, RXD[3..0] presents valid data to MAC through the MII. RXD[3..0] is invalid when RXDV is de-asserted.
- MII Tx Mode: The TXD[3..0] bits are synchronous with TXCLK. When TXEN is asserted, TXD[3..0] presents valid data from the MAC through the MII. TXD[3..0] has no effect when TXEN is de-asserted.

| 42             | NWAYEN                        | lpu/O                   | Nway Auto-Negotiation Enable<br><br>Pull-up (default) = Enable Auto-Negotiation<br>Pull-down = Disable Auto-Negotiation<br><br>During power-up / reset, this pin value is latched into register 0h bit 12.                                                                                                                                                                                                                                                                                                                                                         |             |      |     |               |     |                     |     |                     |     |                     |     |                              |     |                     |     |                  |     |                     |

### Note:

1. lpu/O = Input with internal pull-up (40K +/-30%) during power-up/reset; output pin otherwise.

lpd/O = Input with internal pull-down (40K +/-30%) during power-up/reset; output pin otherwise.

Pin strap-ins are latched during power-up or reset. In some systems, the MAC receive input pins may drive high during power-up or reset, and consequently cause the PHY strap-in pins on the MII signals to be latched high. In this case, it is recommended to add 1K pull-downs on these PHY strap-in pins to ensure the PHY does not strap-in to ISOLATE mode, or is not configured with an incorrect PHY Address.

## Functional Description

The KSZ8041TL is a single 3.3V supply Fast Ethernet transceiver. It is fully compliant with the IEEE 802.3u specification. On the media side, the KSZ8041TL supports 10Base-T and 100Base-TX with HP auto MDI/MDI-X for reliable detection of and correction for straight-through and crossover cables.

The KSZ8041TL offers a choice of MII, RMII, or SMII data interface connection to a MAC processor. The MII management bus option gives the MAC processor complete access to the KSZ8041TL control and status registers. Additionally, an interrupt pin eliminates the need for the processor to poll for PHY status change.

Physical signal transmission and reception are enhanced through the use of patented analog circuitries that make the design more efficient and allow for lower power consumption and smaller chip die size.

The KSZ8041FTL has all the identical rich features of the KSZ8041TL plus 100Base-FX fiber support.

The KSZ8041MLL is the basic 10Base-T/100Base-TX copper version with MII support.

### 100Base-TX Transmit

The 100Base-TX transmit function performs parallel-to-serial conversion, 4B/5B coding, scrambling, NRZ-to-NRZI conversion, and MLT3 encoding and transmission.

The circuitry starts with a parallel-to-serial conversion, which converts the MII data from the MAC into a 125MHz serial bit stream. The data and control stream is then converted into 4B/5B coding, followed by a scrambler. The serialized data is further converted from NRZ-to-NRZI format, and then transmitted in MLT3 current output.

The output current is set by an external 6.49 K $\Omega$  1% resistor for the 1:1 transformer ratio. It has typical rise/fall times of 4 ns and complies with the ANSI TP-PMD standard regarding amplitude balance, overshoot and timing jitter. The wave-shaped 10Base-T output drivers are also incorporated into the 100Base-TX drivers.

### 100Base-TX Receive

The 100Base-TX receiver function performs adaptive equalization, DC restoration, MLT3-to-NRZI conversion, data and clock recovery, NRZI-to-NRZ conversion, de-scrambling, 4B/5B decoding, and serial-to-parallel conversion.

The receiving side starts with the equalization filter to compensate for inter-symbol interference (ISI) over the twisted pair cable. Since the amplitude loss and phase distortion is a function of the cable length, the equalizer must adjust its characteristics to optimize performance. In this design, the variable equalizer makes an initial estimation based upon comparisons of incoming signal strength against some known cable characteristics, and then tunes itself for optimization. This is an ongoing process and self-adjusts against environmental changes such as temperature variations.

Next, the equalized signal goes through a DC restoration and data conversion block. The DC restoration circuit is used to compensate for the effect of baseline wander and to improve the dynamic range. The differential data conversion circuit converts the MLT3 format back to NRZI. The slicing threshold is also adaptive.

The clock recovery circuit extracts the 125MHz clock from the edges of the NRZI signal. This recovered clock is then used to convert the NRZI signal into the NRZ format. This signal is sent through the de-scrambler followed by the 4B/5B decoder. Finally, the NRZ serial data is converted to the MII format and provided as the input data to the MAC.

### PLL Clock Synthesizer

The KSZ8041TL/FTL/MLL generates 125MHz, 25MHz and 20MHz clocks for system timing. In MII mode, internal clocks are generated from an external 25MHz crystal or oscillator. For the KSZ8041TL/FTL, in RMII and SMII modes, these internal clocks are generated from external 50MHz and 125MHz oscillators or system clocks, respectively.

### Scrambler/De-scrambler (100Base-TX only)

The purpose of the scrambler is to spread the power spectrum of the signal in order to reduce EMI and baseline wander.

### 10Base-T Transmit

The 10Base-T drivers are incorporated with the 100Base-TX drivers to allow for transmission using the same magnetic. The drivers also perform internal wave-shaping and pre-emphasize, and output 10Base-T signals with a typical amplitude of 2.5V peak. The 10Base-T signals have harmonic contents that are at least 27dB below the fundamental frequency when driven by an all-ones Manchester-encoded signal.

### 10Base-T Receive

On the receive side, input buffer and level detecting squelch circuits are employed. A differential input receiver circuit and a PLL performs the decoding function. The Manchester-encoded data stream is separated into clock signal and NRZ data. A squelch circuit rejects signals with levels less than 400mV or with short pulse widths to prevent noise at the RX+ and RX- inputs from falsely trigger the decoder. When the input exceeds the squelch limit, the PLL locks onto the incoming signal and the KSZ8041TL/FTL/MLL decodes a data frame. The receive clock is kept active during idle periods in between data reception.

### SQE and Jabber Function (10Base-T only)

In 10Base-T operation, a short pulse is put out on the COL pin after each frame is transmitted. This SQE Test is required as a test of the 10Base-T transmit/receive path. If transmit enable (TXEN) is high for more than 20ms (jabbering), the 10Base-T transmitter is disabled and COL is asserted high. If TXEN is then driven low for more than 250ms, the 10Base-T transmitter is re-enabled and COL is de-asserted (returns to low).

### Auto-Negotiation

The KSZ8041TL/FTL/MLL conforms to the auto-negotiation protocol, defined in Clause 28 of the IEEE 802.3u specification. Auto-negotiation is enabled by either hardware pin strapping (pin 42) or software (register 0h bit 12).

Auto-negotiation allows unshielded twisted pair (UTP) link partners to select the highest common mode of operation. Link partners advertise their capabilities to each other, and then compare their own capabilities with those they received from their link partners. The highest speed and duplex setting that is common to the two link partners is selected as the mode of operation.

The following list shows the speed and duplex operation mode from highest to lowest.

- Priority 1: 100Base-TX, full-duplex
- Priority 2: 100Base-TX, half-duplex
- Priority 3: 10Base-T, full-duplex
- Priority 4: 10Base-T, half-duplex

If auto-negotiation is not supported or the KSZ8041TL/FTL/MLL link partner is forced to bypass auto-negotiation, the KSZ8041TL/FTL/MLL sets its operating mode by observing the signal at its receiver. This is known as parallel detection, and allows the KSZ8041TL/FTL/MLL to establish link by listening for a fixed signal protocol in the absence of auto-negotiation advertisement protocol.

The auto-negotiation link up process is shown in the following flow chart.

Figure 1. Auto-Negotiation Flow Chart

## MII Management (MIIM) Interface

The KSZ8041TL/FTL/MLL supports the IEEE 802.3 MII Management Interface, also known as the Management Data Input / Output (MDIO) Interface. This interface allows upper-layer devices to monitor and control the state of the KSZ8041TL/FTL/MLL. An external device with MIIM capability is used to read the PHY status and/or configure the PHY settings. Further details on the MIIM interface can be found in Clause 22.2.4 of the IEEE 802.3 Specification.

The MIIM interface consists of the following:

- A physical connection that incorporates the clock line (MDC) and the data line (MDIO).
- A specific protocol that operates across the aforementioned physical connection that allows an external controller to communicate with one or more PHY devices. Each KSZ8041TL/FTL/MLL device is assigned a unique PHY address between 1 and 7 by its PHYAD[2:0] strapping pins. Also, every KSZ8041TL/FTL/MLL device supports the broadcast PHY address 0, as defined per the IEEE 802.3 Specification, which can be used to read/write to a single KSZ8041TL/FTL/MLL device, or write to multiple KSZ8041TL/FTL/MLL devices simultaneously.
- A set of 16-bit MDIO registers. Register [0:6] are required, and their functions are defined per the IEEE 802.3 Specification. The additional registers are provided for expanded functionality.

The following table shows the MII Management frame format for the KSZ8041TL/FTL/MLL.

|              | Preamble | Start of Frame | Read/Write OP Code | PHY Address Bits [4:0] | REG Address Bits [4:0] | TA | Data Bits [15:0]  | Idle |
|--------------|----------|----------------|--------------------|------------------------|------------------------|----|-------------------|------|
| <b>Read</b>  | 32 1's   | 01             | 10                 | 00AAA                  | RRRRR                  | Z0 | DDDDDDDD_DDDDDDDD | Z    |
| <b>Write</b> | 32 1's   | 01             | 01                 | 00AAA                  | RRRRR                  | 10 | DDDDDDDD_DDDDDDDD | Z    |

**Table 1. MII Management Frame Format**

## Interrupt (INTRP)

INTRP (pin 32) is an optional interrupt signal that is used to inform the external controller that there has been a status update to the KSZ8041TL/FTL/MLL PHY register. Bits[15:8] of register 1Bh are the interrupt control bits, and are used to enable and disable the conditions for asserting the INTRP signal. Bits[7:0] of register 1Bh are the interrupt status bits, and are used to indicate which interrupt conditions have occurred. The interrupt status bits are cleared after reading register 1Bh.

Bit 9 of register 1Fh sets the interrupt level to active high or active low.

## MII Data Interface

The Media Independent Interface (MII) is specified in Clause 22 of the IEEE 802.3 Specification. It provides a common interface between physical layer and MAC layer devices, and has the following key characteristics:

- Supports 10Mbps and 100Mbps data rates.
- Uses a 25MHz reference clock, sourced by the PHY.
- Provides independent 4-bit wide (nibble) transmit and receive data paths.
- Contains two distinct groups of signals: one for transmission and the other for reception.

By default, the KSZ8041TL/FTL/MLL is configured to MII mode after it is power-up or reset with the following:

- A 25MHz crystal connected to XI, XO (pins 15, 14), or an external 25MHz clock source (oscillator) connected to XI.
- CONFIGURATION[2:0] (pins 27, 41, 40) set to '000' (default setting).

## MII Signal Definition

The following table describes the MII signals. Refer to Clause 22 of the IEEE 802.3 Specification for detailed information.

| MII Signal Name | Direction<br>(with respect to PHY,<br>KSZ8041TL/FTL/MLL signal) | Direction<br>(with respect to MAC) | Description                                                |
|-----------------|-----------------------------------------------------------------|------------------------------------|------------------------------------------------------------|
| TXC             | Output                                                          | Input                              | Transmit Clock<br>(2.5 MHz for 10Mbps; 25 MHz for 100Mbps) |
| TXEN            | Input                                                           | Output                             | Transmit Enable                                            |
| TXD[3:0]        | Input                                                           | Output                             | Transmit Data [3:0]                                        |
| RXC             | Output                                                          | Input                              | Receive Clock<br>(2.5 MHz for 10Mbps; 25 MHz for 100Mbps)  |

**Table 2. MII Signal Definition**

### **Transmit Clock (TXC)**

TXC is sourced by the PHY. It is a continuous clock that provides the timing reference for TXEN and TXD[3:0].

TXC is 2.5MHz for 10Mbps operation and 25MHz for 100Mbps operation.

### **Transmit Enable (TXEN)**

TXEN indicates the MAC is presenting nibbles on TXD[3:0] for transmission. It is asserted synchronously with the first nibble of the preamble and remains asserted while all nibbles to be transmitted are presented on the MII, and is negated prior to the first TXC following the final nibble of a frame.

TXEN transitions synchronously with respect to TXC.

### **Transmit Data [3:0] (TXD[3:0])**

TXD[3:0] transitions synchronously with respect to TXC. When TXEN is asserted, TXD[3:0] are accepted for transmission by the PHY. TXD[3:0] is "00" to indicate idle when TXEN is de-asserted. Values other than "00" on TXD[3:0] while TXEN is de-asserted are ignored by the PHY.

### **Receive Clock (RXC)**

RXC provides the timing reference for RXDV, RXD[3:0], and RXER.

- In 10Mbps mode, RXC is recovered from the line while carrier is active. RXC is derived from the PHY's reference clock when the line is idle, or link is down.
- In 100Mbps mode, RXC is continuously recovered from the line. If link is down, RXC is derived from the PHY's reference clock.

RXC is 2.5MHz for 10Mbps operation and 25MHz for 100Mbps operation.

**Receive Data Valid (RXDV)**

RXDV is driven by the PHY to indicate that the PHY is presenting recovered and decoded nibbles on RXD[3:0].

- In 10Mbps mode, RXDV is asserted with the first nibble of the SFD (Start of Frame Delimiter), “5D”, and remains asserted until the end of the frame.
- In 100Mbps mode, RXDV is asserted from the first nibble of the preamble to the last nibble of the frame.

RXDV transitions synchronously with respect to RXC.

**Receive Data [3:0] (RXD[3:0])**

RXD[3:0] transitions synchronously with respect to RXC. For each clock period in which RXDV is asserted, RXD[3:0] transfers a nibble of recovered data from the PHY.

**Receive Error (RXER)**

RXER is asserted for one or more RXC periods to indicate that a Symbol Error (e.g. a coding error that a PHY is capable of detecting, and that may otherwise be undetectable by the MAC sub-layer) was detected somewhere in the frame presently being transferred from the PHY.

RXER transitions synchronously with respect to RXC. While RXDV is de-asserted, RXER has no effect on the MAC.

**Carrier Sense (CRS)**

CRS is asserted and de-asserted as follows:

- In 10Mbps mode, CRS assertion is based on the reception of valid preambles. CRS de-assertion is based on the reception of an end-of-frame (EOF) marker.
- In 100Mbps mode, CRS is asserted when a start-of-stream delimiter, or /J/K symbol pair is detected. CRS is de-asserted when an end-of-stream delimiter, or /T/R symbol pair is detected. Additionally, the PMA layer de-asserts CRS if IDLE symbols are received without /T/R.

**Collision (COL)**

COL is asserted in half-duplex mode whenever the transmitter and receiver are simultaneously active on the line. This is used to inform the MAC that a collision has occurred during its transmission to the PHY.

COL transitions asynchronously with respect to TXC and RXC.

**Reduced MII (RMII) Data Interface (KSZ8041TL/FTL only)**

The Reduced Media Independent Interface (RMII) specifies a low pin count Media Independent Interface (MII). It provides a common interface between physical layer and MAC layer devices, and has the following key characteristics:

- Supports 10Mbps and 100Mbps data rates.
- Uses a single 50MHz reference clock provided by the MAC or the system board.
- Provides independent 2-bit wide (di-bit) transmit and receive data paths.
- Contains two distinct groups of signals: one for transmission and the other for reception.

The KSZ8041TL/FTL is configured in RMII mode after it is power-up or reset with the following:

- A 50 MHz reference clock connected to REFCLK (pin 15).
- CONFIG[2:0] (pins 27, 41, 40) set to ‘001’.

In RMII mode, unused MII signals, TXD[3:2] (pins 39, 38), are tied to ground.

**RMII Signal Definition (KSZ8041TL/FTL only)**

The following table describes the RMII signals. Refer to RMII Specification for detailed information.

| RMII Signal Name | Direction<br>(with respect to PHY,<br>KSZ8041TL/FTL signal) | Direction<br>(with respect to MAC) | Description                                                                    |
|------------------|-------------------------------------------------------------|------------------------------------|--------------------------------------------------------------------------------|
| REF_CLK          | Input                                                       | Input, or Output                   | Synchronous 50 MHz clock reference for receive, transmit and control interface |
| TX_EN            | Input                                                       | Output                             | Transmit Enable                                                                |
| TXD[1:0]         | Input                                                       | Output                             | Transmit Data [1:0]                                                            |
| CRS_DV           | Output                                                      | Input                              | Carrier Sense/Receive Data Valid                                               |
| RXD[1:0]         | Output                                                      | Input                              | Receive Data [1:0]                                                             |
| RX_ER            | Output                                                      | Input, or (not required)           | Receive Error                                                                  |

**Table 3. RMII Signal Description**

**Reference Clock (REF\_CLK)**

REF\_CLK is sourced by the MAC or system board. It is a continuous 50 MHz clock that provides the timing reference for TX\_EN, TXD[1:0], CRS\_DV, RXD[1:0], and RX\_ER.

**Transmit Enable (TX\_EN)**

TX\_EN indicates that the MAC is presenting di-bits on TXD[1:0] for transmission. It is asserted synchronously with the first nibble of the preamble and remains asserted while all di-bits to be transmitted are presented on the RMII, and is negated prior to the first REF\_CLK following the final di-bit of a frame.

TX\_EN transitions synchronously with respect to REF\_CLK.

**Transmit Data [1:0] (TXD[1:0])**

TXD[1:0] transitions synchronously with respect to REF\_CLK. When TX\_EN is asserted, TXD[1:0] are accepted for transmission by the PHY. TXD[1:0] is "00" to indicate idle when TX\_EN is de-asserted. Values other than "00" on TXD[1:0] while TX\_EN is de-asserted are ignored by the PHY.

**Carrier Sense/Receive Data Valid (CRS\_DV)**

CRS\_DV is asserted by the PHY when the receive medium is non-idle. It is asserted asynchronously on detection of carrier. This is when squelch is passed in 10Mbps mode, and when 2 non-contiguous zeroes in 10 bits are detected in 100Mbps mode. Loss of carrier results in the de-assertion of CRS\_DV.

So long as carrier detection criteria are met, CRS\_DV remains asserted continuously from the first recovered di-bit of the frame through the final recovered di-bit, and it is negated prior to the first REF\_CLK that follows the final di-bit. The data on RXD[1:0] is considered valid once CRS\_DV is asserted. However, since the assertion of CRS\_DV is asynchronous relative to REF\_CLK, the data on RXD[1:0] is "00" until proper receive signal decoding takes place.

**Receive Data [1:0] (RXD[1:0])**

RXD[1:0] transitions synchronously to REF\_CLK. For each clock period in which CRS\_DV is asserted, RXD[1:0] transfers two bits of recovered data from the PHY. RXD[1:0] is "00" to indicate idle when CRS\_DV is de-asserted. Values other than "00" on RXD[1:0] while CRS\_DV is de-asserted are ignored by the MAC.

**Receive Error (RX\_ER)**

RX\_ER is asserted for one or more REF\_CLK periods to indicate that a Symbol Error (e.g. a coding error that a PHY is capable of detecting, and that may otherwise be undetectable by the MAC sub-layer) was detected somewhere in the frame presently being transferred from the PHY.

RX\_ER transitions synchronously with respect to REF\_CLK. While CRS\_DV is de-asserted, RX\_ER has no effect on the MAC.

***Collision Detection***

The MAC regenerates the COL signal of the MII from TX\_EN and CRS\_DV.

**Serial MII (SMII) Data Interface (KSZ8041TL/FTL only)**

The Serial Media Independent Interface (SMII) is the lowest pin count Media Independent Interface (MII). It provides a common interface between physical layer and MAC layer devices, and has the following key characteristics:

- Supports 10Mbps and 100Mbps data rates.
- Uses 125MHz reference clock provided by the MAC or the system board.
- Uses 12.5MHz sync pulse provided by the MAC.
- Provides independent single-bit wide transmit and receive data paths for data and control information.

The KSZ8041TL/FTL is configured in SMII mode after it is power-up or reset with the following:

- A 125MHz reference clock connected to CLOCK (pin 15).
- A 12.5MHz sync pulse connected to SYNC (pin 36).
- CONFIGURATION[2:0] (pins 27, 41, 40) set to '010'.

In SMII mode, unused MII signals, TXD[3:2] (pins 39, 38), are tied to ground.

**SMII Signal Definition (KSZ8041TL/FTL only)**

The following table describes the SMII signals. Refer to SMII Specification for detailed information.

| SMII Signal Name | Direction<br>(with respect to PHY,<br>KSZ8041TL/FTL signal) | Direction<br>(with respect to MAC) | Description                                                       |
|------------------|-------------------------------------------------------------|------------------------------------|-------------------------------------------------------------------|
| CLOCK            | Input                                                       | Input, or Output                   | 125 MHz clock reference for receive and transmit data and control |
| SYNC             | Input                                                       | Output                             | 12.5 MHz sync pulse from MAC                                      |
| TX               | Input                                                       | Output                             | Transmit Data and Control                                         |
| RX               | Output                                                      | Input                              | Receive Data and Control                                          |

**Table 4. SMII Signal Description**

***Clock Reference (CLOCK)***

CLOCK is sourced by the MAC or system board. It is a continuous 125 MHz clock that provides the timing reference for SYNC, TX, and RX.

***Sync Pulse (SYNC)***

SYNC is a 12.5MHz synchronized pulse derived from CLOCK by the MAC. It is used to indicate the segment boundary for each transmit data/control segment, or receive data/control segment. Each segment is comprised of ten bits.

SYNC is generated continuously by the MAC at every ten cycles of CLOCK.

***Transmit Data and Control (TX)***

TX provides transmit data and control information from MAC-to-PHY in 10-bit segments.

- In 10Mbps mode, each segment is repeated ten times. Therefore, every ten segments represent a new byte of data. The PHY can sample any one of every ten segments.
- In 100Mbps mode, each segment represents a new byte of data.

The following figure and table shows the transmit data/control format for each segment:

Figure 2. SMII Transmit Data/Control Segment

| SMII TX Bit | Description                                              |
|-------------|----------------------------------------------------------|
| TX_ER       | Transmit Error                                           |

| X     | 1     | One Data Byte                                           |                          |                            |                        |                         |      |      |      |

Table 6. SMII TXD[0:7] Encoding Table

Receive Data and Control (RX)

RX provides receive data and control information from PHY-to-MAC in 10-bit segments.

- In 10Mbps mode, each segment is repeated ten times. Therefore, every ten segments represent a new byte of data. The MAC can sample any one of every ten segments.
- In 100Mbps mode, each segment represents a new byte of data.

The following figure and table shows the receive data/control format for each segment:

Figure 3. SMII Receive Data/Control Segment

| SMII RX Bit | Description                                              |
|-------------|----------------------------------------------------------|
| CRS         | Carrier Sense                                            |
| RX_DV       | Receive Data Valid                                       |
| RXD[0:7]    | Encoded Data<br>See SMII RXD[0:7] Encoding Table (below) |

| X   | 0     | RX_ER from pervious frame | Speed<br>0=10M<br>1=100M | Duplex<br>0=Half<br>1=Full | Link<br>0=Down<br>1=Up | Jabber<br>0=No<br>1=Yes | Upper Nibble<br>0=Invalid<br>1=Valid | False Carrier Detected | 1    |
| X   | 1     | One Data Byte             |                          |                            |                        |                         |                                      |                        |      |

Table 8. SMII RXD[0:7] Encoding Table

**Collision Detection**

Collisions occur when CRS and TX\_EN are simultaneously asserted. The MAC regenerates the MII collision signal from CRS and TX\_EN.

### HP Auto MDI/MDI-X

HP Auto MDI/MDI-X configuration eliminates the confusion of whether to use a straight cable or a crossover cable between the KSZ8041TL/FTL/MLL and its link partner. This feature allows the KSZ8041TL/FTL/MLL to use either type of cable to connect with a link partner that is in either MDI or MDI-X mode. The auto-sense function detects transmit and receive pairs from the link partner, and then assigns transmit and receive pairs of the KSZ8041TL/FTL/MLL accordingly.

HP Auto MDI/MDI-X is enabled by default. It is disabled by writing a one to register 1F bit 13. MDI and MDI-X mode is selected by register 1F bit 14 if HP Auto MDI/MDI-X is disabled.

An isolation transformer with symmetrical transmit and receive data paths is recommended to support auto MDI/MDI-X.

The IEEE 802.3 Standard defines MDI and MDI-X as follow:

| MDI       |        | MDI-X     |        |
|-----------|--------|-----------|--------|
| RJ-45 Pin | Signal | RJ-45 Pin | Signal |
| 1         | TD+    | 1         | RD+    |
| 2         | TD-    | 2         | RD-    |
| 3         | RD+    | 3         | TD+    |
| 6         | RD-    | 6         | TD-    |

**Table 9. MDI/MDI-X Pin Definition**

### Straight Cable

A straight cable connects a MDI device to a MDI-X device, or a MDI-X device to a MDI device. The following diagram depicts a typical straight cable connection between a NIC card (MDI) and a switch, or hub (MDI-X).

**Figure 4. Typical Straight Cable Connection**

**Crossover Cable**

A crossover cable connects a MDI device to another MDI device, or a MDI-X device to another MDI-X device. The following diagram depicts a typical crossover cable connection between two switches or hubs (two MDI-X devices).

**Figure 5. Typical Crossover Cable Connection**

## LinkMD<sup>®</sup> Cable Diagnostics

The LinkMD<sup>®</sup> feature utilizes time domain reflectometry (TDR) to analyze the cabling plant for common cabling problems, such as open circuits, short circuits and impedance mismatches.

LinkMD<sup>®</sup> works by sending a pulse of known amplitude and duration down the MDI and MDI-X pairs, and then analyzing the shape of the reflected signal. Timing the pulse duration gives an indication of the distance to the cabling fault with maximum distance of 200m and accuracy of +/-2m. Internal circuitry computes the TDR information and presents it in a user-readable digital format.

Note: Cable diagnostics are only valid for copper connections and do not support fiber optic operation.

## Access

LinkMD<sup>®</sup> is initiated by accessing register 1Dh, the LinkMD<sup>®</sup> Control/Status Register, in conjunction with register 1Fh, the PHY Control 2 Register.

## Usage

The following test procedure demonstrates how to use LinkMD<sup>®</sup> for cable diagnostic:

1. Disable auto MDI/MDI-X by writing a '1' to register 1Fh bit 13 to enable manual control over the differential pair used to transmit the LinkMD<sup>®</sup> pulse.
2. Select the differential pair to transmit the LinkMD<sup>®</sup> pulse with register 1Fh bit 14.
3. Start cable diagnostic test by writing a '1' to register 1Dh bit 15. This enable bit is self-clearing.
4. Wait (poll) for register 1Dh bit 15 to return a '0', indicating cable diagnostic test is completed.
5. Read cable diagnostic test results in register 1Dh bits [14:13]. The results are as follows:
  - 00 = normal condition (valid test)
  - 01 = open condition detected in cable (valid test)
  - 10 = short condition detected in cable (valid test)
  - 11 = cable diagnostic test failed (invalid test)

The '11' case, invalid test, occurs if the KSZ8041TL/FTL/MLL is unable to shut down the link partner. In this instance, the test is not run, since it would be impossible for the KSZ8041TL/FTL/MLL to determine if the detected signal is a reflection of the signal generated by the KSZ8041TL/FTL/MLL, or a signal from its link partner.

6. Get distance to fault by multiplying the decimal value in register 1Dh bits [8:0] by a constant of 0.4. The distance, D (expressed in meters), to the cable fault is determined by the following formula:

$$D \text{ (distance to cable fault)} = 0.4 \times \{\text{decimal value of register 1Dh bits [8:0]}\}$$

The 0.4 constant can be calibrated for different cable types and cabling conditions, such as cables with velocity of propagation that varies significantly from the norm.

## Power Management

The KSZ8041TL/FTL/MLL offers the following power management modes:

### Power Saving Mode

This mode is used to reduce power consumption when the cable is unplugged. It is in effect when auto-negotiation mode is enabled, cable is disconnected, and register 1Fh bit 10 is set to 1. Under power saving mode, the KSZ8041TL/FTL/MLL shuts down all transceiver blocks, except for transmitter, energy detect and PLL circuits. Additionally, in MII mode, the RXC clock output is disabled. RXC clock is enabled after the cable is connected and link is established.

Power saving mode is disabled by writing a zero to register 1Fh bit 10.

### Power Down Mode

This mode is used to power down the entire KSZ8041TL/FTL/MLL device when it is not in use. Power down mode is enabled by writing a one to register 0h bit 11. In the power down state, the KSZ8041TL/FTL/MLL disables all internal functions, except for the MII management interface.

### Reference Clock Connection Options

A crystal or clock source, such as an oscillator, is used to provide the reference clock for the KSZ8041TL/FTL/MLL. The following figure illustrates how to connect the 25MHz crystal and oscillator reference clock for MII mode.

**Figure 6. 25MHz Crystal / Oscillator Reference Clock for MII Mode**

For the KSZ8041TL/FTL, the following figure illustrates how to connect the 50MHz oscillator reference clock for RMII mode.

**Figure 7. 50MHz Oscillator Reference Clock for RMII Mode**

For the KSZ8041TL/FTL, the following figure illustrates how to connect the 125MHz oscillator reference clock for SMII mode.

**Figure 8. 125MHz Oscillator Reference Clock for SMII Mode**

Reference Circuit for Power and Ground Connections

The KSZ8041TL/FTL/MLL is a single 3.3V supply device with a built-in 1.8V low noise regulator. The power and ground connections are shown in the following figure and table.

Figure 9. KSZ8041TL/FTL/MLL Power and Ground Connections

| Power Pin | Pin Number | Pin Type | Description                                                                                             |
|-----------|------------|----------|---------------------------------------------------------------------------------------------------------|
| V1.8_OUT  | 6          | Output   | 1.8V supply output from KSZ8041TL/FTL/MLL<br>Decouple with 22uF and 0.1uF capacitors to ground.         |
| VDD_1.8   | 31         | Input    | Connect to V1.8_OUT (pin 6) thru ferrite bead.<br>Decouple with 0.1uF capacitor to ground.              |

| VDDA_3.3  | 7, 8       | Input    | Connect to board's 3.3V supply thru ferrite bead.<br>Decouple with 22uF and 0.1uF capacitors to ground. |

Table 10. KSZ8041TL/FTL/MLL Power Pin Description

**100Base-FX Fiber Operation (KSZ8041FTL only)**

100Base-FX fiber operation is similar to 100Base-TX copper operation with the differences being that the scrambler/de-scrambler and MLT3 encoder/decoder are bypassed on transmission and reception. In addition, auto-negotiation is bypassed, auto MDI/MDI-X is disabled, and speed is set to 100Mbps. The duplex can be set to either half or full. Usually, it is set to full-duplex.

**Fiber Signal Detect**

In 100Base-FX operation, FXSD (fiber signal detect), input pin 48, is usually connected to the fiber transceiver SD (signal detect) output pin. 100Base-FX mode is activated when the FXSD input pin is greater than 1V. When FXSD is between 1V and 1.8V, no fiber signal is detected and a Far-End Fault is generated. When FXSD is over 2.2V, the fiber signal is detected.

100Base-FX mode and signal detection is summarized in the following table:

| FXSD Input Voltage                  | Mode                                                                     |
|-------------------------------------|--------------------------------------------------------------------------|
| Less than 0.2V                      | Copper mode                                                              |
| Greater than 1V, but less than 1.8V | Fiber mode<br>No signal detected<br>Far-End Fault generated (if enabled) |
| Greater than 2.2V                   | Fiber mode<br>Signal detected                                            |

**Table 11. Copper and Fiber Mode Selection**

To ensure proper operation, a resistive voltage divider is recommended to adjust the fiber transceiver SD (signal detect) output voltage swing to match the FXSD pin's input voltage threshold.

Alternatively, the Far-End Fault feature can be disabled. In this case, the FXSD input pin is tied high to 3.3V to force 100Base-FX mode.

**Far-End Fault**

A Far-End Fault (FEF) occurs when the signal detection is logically false on the receive side of the fiber transceiver. The KSZ8041FTL detects a FEF when its FXSD input (pin 48) is between 1V and 1.8V. When a FEF is detected, the KSZ8041FTL signals its fiber link partner that a FEF has occurred by transmitting a repetitive pattern of 84-ones and 1-zero. This pattern is used to inform the fiber link partner that there is a faulty link on its transmit side.

By default, FEF is enabled. FEF is disabled by strapping "no FEF" (pin 43) low. See "Strapping Options" section for detail.

### Back-to-Back Media Converter

A KSZ8041TL/MLL and a KSZ8041FTL can be connected back-to-back to provide a low cost media converter solution. In back-to-back mode, media conversion is between 100Base-TX copper and 100Base-FX fiber. On the copper side, link up at 10Base-T is not allowed, and is blocked during auto-negotiation.

Figure 10. KSZ8041TL/MLL and KSZ8041FTL Back-to-Back Media Converter

### MII Back-to-Back Mode

In MII Back-to-Back mode, the KSZ8041TL/MLL interfaces with another KSZ8041TL/MLL, or a KSZ8041FTL to provide a complete 100Mbps repeater or media converter solution. The KSZ8041TL/FTL/MLL devices are configured to MII Back-to-Back mode after they are power-up or reset with the following:

- CONFIGURATION[2:0] (pins 27, 41, 40) set to '110'
- A common 25MHz reference clock connected to XI (pin 15)
- MII signals connected as shown in the following table.

| KSZ8041MLL (100Base-TX copper)<br>KSZ8041TL (100Base-TX copper) |            |          | KSZ8041MLL (100Base-TX copper)<br>KSZ8041TL (100Base-TX copper)<br>KSZ8041FTL (100Base-FX fiber) |            |          |
|-----------------------------------------------------------------|------------|----------|--------------------------------------------------------------------------------------------------|------------|----------|
| Pin Name                                                        | Pin Number | Pin Type | Pin Name                                                                                         | Pin Number | Pin Type |
| RXC                                                             | 28         | Output   | TXC                                                                                              | 33         | Input    |
| RXDV                                                            | 27         | Output   | TXEN                                                                                             | 34         | Input    |
| RXD3                                                            | 20         | Output   | TXD3                                                                                             | 39         | Input    |
| RXD2                                                            | 21         | Output   | TXD2                                                                                             | 38         | Input    |
| RXD1                                                            | 22         | Output   | TXD1                                                                                             | 36         | Input    |
| RXD0                                                            | 23         | Output   | TXD0                                                                                             | 35         | Input    |
| TXC                                                             | 33         | Input    | RXC                                                                                              | 28         | Output   |
| TXEN                                                            | 34         | Input    | RXDV                                                                                             | 27         | Output   |
| TXD3                                                            | 39         | Input    | RXD3                                                                                             | 20         | Output   |
| TXD2                                                            | 38         | Input    | RXD2                                                                                             | 21         | Output   |
| TXD1                                                            | 36         | Input    | RXD1                                                                                             | 22         | Output   |
| TXD0                                                            | 35         | Input    | RXD0                                                                                             | 23         | Output   |

Table 12. MII Signal Connection for MII Back-to-Back Mode

**RMII Back-to-Back Mode (KSZ8041TL/FTL only)**

In RMII Back-to-Back mode, the KSZ8041TL interfaces with another KSZ8041TL, or a KSZ8041FTL to provide a complete 100Mbps repeater or media converter solution. The KSZ8041TL/FTL devices are configured to RMII Back-to-Back mode after they are power-up or reset with the following:

- CONFIGURATION[2:0] (pins 27, 41, 40) set to '101'
- A common 50MHz reference clock connected to REFCLK (pin 15)
- RMII signals connected as shown in the following table.

| KSZ8041TL (100Base-TX copper) |            |          | KSZ8041TL (100Base-TX copper)<br>KSZ8041FTL (100Base-FX fiber) |            |          |
|-------------------------------|------------|----------|----------------------------------------------------------------|------------|----------|
| Pin Name                      | Pin Number | Pin Type | Pin Name                                                       | Pin Number | Pin Type |
| CRSDV                         | 27         | Output   | TXEN                                                           | 34         | Input    |
| RXD1                          | 22         | Output   | TXD1                                                           | 36         | Input    |
| RXD0                          | 23         | Output   | TXD0                                                           | 35         | Input    |
| TXEN                          | 34         | Input    | CRSDV                                                          | 27         | Output   |
| TXD1                          | 36         | Input    | RXD1                                                           | 22         | Output   |
| TXD0                          | 35         | Input    | RXD0                                                           | 23         | Output   |

**Table 13. RMII Signal Connection for RMII Back-to-Back Mode**

RMII Back-to-Back mode provides an option to disable the fiber side when the copper side is down. This, effectively, produces a link fault propagation for media converter applications, such that a copper side link down will automatically disable the fiber side. This KSZ8041TL/FTL feature functions as follows:

- On the KSZ8041TL copper side, RXD2 (pin 21) indicates if there is energy detected at the receive inputs of the copper port. RXD2 outputs a low if there is no energy detected (cable disconnected), and outputs a high if there is energy detected (cable connected).
- The RXD2 output of the KSZ8041TL copper side drives the input of an inverter, and the output of the inverter drives the TXD2 (pin 38) input of the KSZ8041FTL fiber side. The fiber side transmitter is disabled if the TXD2 input is high.

The TXD3 and TXD2 pins should be pulled down with 1K resistors, and RXD3 and RXD2 pins should be left floating, if they are not used.

## Register Map

| Register Number (Hex) | Description                           |

**Notes:**

1. Exceeding the absolute maximum rating may damage the device. Stresses greater than the absolute maximum rating may cause permanent damage to the device. Operation of the device at these or any other conditions above those specified in the operating sections of this specification is not implied. Maximum conditions for extended periods may affect reliability.
2. The device is not guaranteed to function outside its operating rating.
3.  $T_A = 25^{\circ}\text{C}$ . Specification for packaged product only.
4. Current consumption is for the single 3.3V supply KSZ8041TL/FTL/MLL device only, and includes the 1.8V supply voltage ( $V_{DD\_1.8}$ ,  $V_{DDA\_1.8}$ ,  $V_{1.8\_OUT}$ ) that is provided by the KSZ8041TL/FTL/MLL. The PHY port's transformer consumes an additional 45mA @ 3.3V for 100Base-TX and 70mA @ 3.3V for 10Base-T.

MDC/MDIO Timing

Figure 21. MDC/MDIO Timing

| Timing Parameter | Description                                     | Min | Typ | Max | Unit |
|------------------|-------------------------------------------------|-----|-----|-----|------|
| $t_P$            | MDC period                                      |     | 400 |     | ns   |
| $t_{MD1}$        | MDIO (PHY input) setup to rising edge of MDC    | 10  |     |     | ns   |
| $t_{MD2}$        | MDIO (PHY input) hold from rising edge of MDC   | 4   |     |     | ns   |
| $t_{MD3}$        | MDIO (PHY output) delay from rising edge of MDC |     | 222 |     | ns   |

Table 22. MDC/MDIO Timing Parameters

Reset Timing

The KSZ8041TL/FTL/MLL reset timing requirement is summarized in the following figure and table.

Figure 22. Reset Timing

| Parameter | Description                         | Min | Max | Units |
|-----------|-------------------------------------|-----|-----|-------|
| $t_{sr}$  | Stable supply voltage to reset high | 10  |     | ms    |
| $t_{cs}$  | Configuration setup time            | 5   |     | ns    |
| $t_{ch}$  | Configuration hold time             | 5   |     | ns    |
| $t_{rc}$  | Reset to strap-in pin output        | 6   |     | ns    |

Table 23. Reset Timing Parameters

After the de-assertion of reset, it is recommended to wait a minimum of 100μs before starting programming on the MIIM (MDC/MDIO) Interface.

## Reset Circuit

The following reset circuit is recommended for powering up the KSZ8041TL/FTL/MLL if reset is triggered by the power supply.

Figure 23. Recommended Reset Circuit

The following reset circuit is recommended for applications where reset is driven by another device (e.g., CPU or FPGA). At power-on-reset, R, C and D1 provide the necessary ramp rise time to reset the KSZ8041TL/FTL/MLL device. The RST\_OUT\_n from CPU/FPGA provides the warm reset after power up.

Figure 24. Recommended Reset Circuit for Interfacing with CPU/FPGA Reset Output

The following figure shows the reference circuits for pull-up, float and pull-down on the LED1 and LED0 strapping pins.

Figure 25. Reference Circuits for LED Strapping Pins

## Selection of Isolation Transformer

A 1:1 isolation transformer is required at the line interface. An isolation transformer with integrated common-mode chokes is recommended for exceeding FCC requirements.

The following table gives recommended transformer characteristics.

| Parameter                        | Value        | Test Condition     |
|----------------------------------|--------------|--------------------|
| Turns ratio                      | 1 CT : 1 CT  |                    |
| Open-circuit inductance (min.)   | 350 $\mu$ H  | 100mV, 100kHz, 8mA |
| Leakage inductance (max.)        | 0.4 $\mu$ H  | 1MHz (min.)        |
| Inter-winding capacitance (typ.) | 12pF         |                    |
| D.C. resistance (typ.)           | 0.9 $\Omega$ |                    |
| Insertion loss (max.)            | -1.0dB       | 0MHz – 65MHz       |
| HIPOT (min.)                     | 1500Vrms     |                    |

**Table 24. Transformer Selection Criteria**

| Magnetic Manufacturer | Part Number  | Auto MDI-X | Number of Port |
|-----------------------|--------------|------------|----------------|
| Bel Fuse              | S558-5999-U7 | Yes        | 1              |
| Bel Fuse (Mag Jack)   | SI-46001     | Yes        | 1              |
| Bel Fuse (Mag Jack)   | SI-50170     | Yes        | 1              |
| Delta                 | LF8505       | Yes        | 1              |
| LanKom                | LF-H41S      | Yes        | 1              |
| Pulse                 | H1102        | Yes        | 1              |
| Pulse (low cost)      | H1260        | Yes        | 1              |
| Transpower            | HB726        | Yes        | 1              |
| TDK (Mag Jack)        | TLA-6T718    | Yes        | 1              |

**Table 25. Qualified Single Port Magnetics**

## Selection of Reference Crystal

| Characteristics           | Value    | Units    |
|---------------------------|----------|----------|
| Frequency                 | 25       | MHz      |
| Frequency tolerance (max) | $\pm 50$ | ppm      |
| Load capacitance          | 20       | pF       |
| Series resistance         | 40       | $\Omega$ |

**Table 26. Typical Reference Crystal Characteristics**

Package Information

48-Pin LQFP

48-Pin (7mm x 7mm) LQFP Package

**48-Pin TQFP**TOP VIEWSIDE VIEWDETAIL "A"BOTTOM VIEW**NOTES:**

1. DIMENSION DOES NOT INCLUDE MOLD FLASH OR PROTRUSIONS, EITHER OF WHICH SHALL NOT EXCEED 0.254MM.
2. LEAD DIMENSION DOES NOT INCLUDE DAMBAR PROTRUSION.
3. PACKAGE TOP MOLD DIMENSIONS ARE SMALLER THAN BOTTOM
4. MOLD DIMENSIONS AND TOP OF PACKAGE WILL NOT OVERHANG BOTTOM OF PACKAGE.

**48-Pin (7mm x 7mm) TQFP Package**

**Note:** ALL DIMENSIONS ARE IN MILLIMETERS.
