

# LTC1470/LTC1471

## ABSOLUTE MAXIMUM RATINGS (Note 1)

3.3V Supply Voltage ( $3V_{IN}$ ) (Note 2) ..... 7V  
 5V Supply Voltage ( $5V_{IN}$ ) (Note 2) ..... 7V  
 Enable Input Voltage .....  $5V_{IN}$  to (GND – 0.3V)  
 Output Voltage (OFF) (Note 2) ..... 7V to (GND – 0.3V)  
 Output Short-Circuit Duration ..... Indefinite

Operating Temperature  
 LTC1470C ..... 0°C to 70°C  
 LTC1470E (Note 7) ..... –40°C to 85°C  
 Junction Temperature ..... 100°C  
 Storage Temperature Range ..... –65°C to 150°C  
 Lead Temperature (Soldering, 10 sec) ..... 300°C

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

**Note 2:** For the LTC1470, the two output pins (1, 8) must be connected together and the two 3.3V supply input pins (6, 7) must be connected together. For the LTC1471, the two AOUT pins (1, 16) must be connected together, the two BOUT pins (8, 9) must be connected together, the two A3V<sub>IN</sub> supply input pins (14, 15) must be connected together, the two B3V<sub>IN</sub> supply pins (6, 7) must be connected together and the two GND pins (5, 13) must be connected together.

**Note 3:** Power for the input logic and charge pump circuitry is derived from the 5V<sub>IN</sub> supply pin(s) which must be continuously powered.

**Note 4:** Measured current is per channel with the other channel programmed off for the LTC1471.

**Note 5:** The output is protected with foldback current limit which reduces the short-circuit (0V) currents below peak permissible current levels at higher output voltages.

**Note 6:** To 90% of final value.

**Note 7:** The LTC1470 is guaranteed to meet performance specifications from 0°C to 70°C. Specifications over the -40°C to 85°C operating temperature range are assured by design, characterization and correlation with statistical process controls.

## TYPICAL PERFORMANCE CHARACTERISTICS (LTC1470 or 1/2 LTC1471)

## PIN FUNCTIONS

### LTC1470

**OUT (Pins 1, 8):** Output Pins. The outputs of the LTC1470 are switched between three operating states: OFF, 3.3V and 5V. These pins are protected against accidental short circuits to ground by SafeSlot current limit circuitry which protects the socket, the card, and the system power supplies against damage. A second level of protection is provided by thermal shutdown circuitry which protects both switches against over-temperature conditions.

**5V<sub>IN</sub> (Pin 2):** 5V Input Supply Pin. The 5V<sub>IN</sub> supply pin serves two purposes. The first purpose is as the power supply input for the 5V NMOS switch. The second purpose is to provide power for the input, gate drive, and protection circuitry for both the 3.3V and 5V V<sub>CC</sub> switches. This pin must therefore be continuously powered.

**EN1, EN0 (Pins 3, 4):** Enable Inputs. The two V<sub>CC</sub> Enable inputs are designed to interface directly with industry standard PCMCIA controllers and are high impedance CMOS gates with ESD protection diodes to ground, and

should not be forced above 5V<sub>IN</sub> or below ground. Both inputs have about 100mV of built-in hysteresis to ensure clean switching between operating modes. The LTC1470 is designed to operate *without* 12V power. The gates of the V<sub>CC</sub> NMOS switches are powered by charge pumps from the 5V<sub>IN</sub> supply pins (see Applications Information section for more detail). The Enable inputs should be turned off (both asserted high or both asserted low) at least 100μs before the 5V<sub>IN</sub> power is removed to ensure that both V<sub>CC</sub> NMOS switch gates are fully discharged and both switches are in the high impedance mode.

**GND (Pin 5):** Ground Connection.

**3V<sub>IN</sub> (Pins 6, 7):** 3V Input Supply Pins. The 3V<sub>IN</sub> supply pins serve as the power supply input for the 3.3V switches. These pins do not provide any power to the internal control circuitry and therefore do not consume any power when unloaded or turned off.

## PIN FUNCTIONS

### LTC1471

**AOUT, BOUT (Pins 1, 16, 8, 9):** Output Pins. The outputs of the LTC1471 are switched between three operating states: OFF, 3.3V and 5V. These pins are protected against accidental short circuits to ground by SafeSlot current limit circuitry which protects the socket, the card, and the system power supplies against damage. A second level of protection is provided by thermal shutdown circuitry.

**5V<sub>IN</sub> (Pins 2, 10):** 5V Input Supply Pins. The 5V<sub>IN</sub> supply pins serve two purposes. The first purpose is as the power supply input for the 5V NMOS switches. The second purpose is to provide power for the input, gate drive, and protection circuitry. These pins must therefore be continuously powered.

**EN1, EN0 (Pins 3, 4, 11, 12):** Enable Inputs. The enable inputs are designed to interface directly with industry standard PCMCIA controllers and are high impedance CMOS gates with ESD protection diodes to ground, and

should not be forced above 5V<sub>IN</sub> or below ground. All four inputs have about 100mV of built-in hysteresis to ensure clean switching between operating modes. The LTC1471 is designed to operate *without* 12V power. The gates of the V<sub>CC</sub> NMOS switches are powered by charge pumps from the 5V<sub>IN</sub> supply pins (see Applications Information section for more detail). The enable inputs should be turned off at least 100μs before the 5V<sub>IN</sub> power is removed to ensure that all NMOS switch gates are fully discharged and are in the high impedance mode.

**GND (Pins 5, 13):** Ground Connections.

**3V<sub>IN</sub> (Pins 6, 7, 14, 15):** 3V Input Supply Pins. The 3V<sub>IN</sub> supply pins serve as the power supply input for the 3.3V switches. These pins do not provide any power to the internal control circuitry, and therefore, do not consume any power when unloaded or turned off.

## BLOCK DIAGRAM (LTC1470 or 1/2 LTC1471)

## OPERATION

The LTC1470 (or 1/2 of the LTC1471) consists of the following functional blocks:

### Input TTL/CMOS Converters

The enable inputs are designed to accommodate a wide range of 3V and 5V logic families. The input threshold voltage is approximately 1.4V with approximately 100mV of hysteresis. The inputs enable the bias generator, the gate charge pumps and the protection circuitry which are powered from the 5V supply. Therefore, when the inputs are turned off, the entire circuit is powered down and the 5V supply current drops below 1 $\mu$ A.

### XOR Input Circuitry

By employing an XOR function, which locks out the 3.3V switch when the 5V switch is turned on and locks out the 5V switch when the 3.3V switch is turned on, there is no danger of both switches being on at the same time. This XOR function also makes it possible to work with either active-low or active-high PCMCIA  $V_{CC}$  switch control logic (see Applications Information section for further details).

### Break-Before-Make Switch Control

Built-in delays are provided to ensure that the 3.3V and 5V switches are non-overlapping. Further, the gate charge pump includes circuitry which ramps the NMOS switches

on slowly (400 $\mu$ s typical rise time) but turns them off much more quickly (typically 10 $\mu$ s).

### Bias, Oscillator and Gate Charge Pump

When either the 3.3V or 5V switch is enabled, a bias current generator and high frequency oscillator are turned on. The on-chip capacitive charge pump generates approximately 12V of gate drive for the internal low  $R_{DS(ON)}$  NMOS  $V_{CC}$  switches from the 5V<sub>IN</sub> power supply. Therefore, an external 12V supply is not required to switch the  $V_{CC}$  output. The 5V<sub>IN</sub> supply current drops below 1 $\mu$ A when both switches are turned off.

### Gate Charge and Discharge Control

All switches are designed to ramp on slowly (400 $\mu$ s typical rise time). Turn-off time is much quicker (typically 10 $\mu$ s). To ensure that both  $V_{CC}$  NMOS switch gates are fully discharged, program the switch to the high impedance mode at least 100 $\mu$ s before turning off the 5V power supply.

### Switch Protection

Both switches are protected against accidental short circuits with SafeSlot foldback current limit circuits which limit the output current to typically 1A when the output is shorted to ground. Both switches also have thermal shut-down which limits the power dissipation to safe levels.

## APPLICATIONS INFORMATION

The LTC1470/LTC1471 are designed to interface directly with industry standard PCMCIA card controllers.

### Interfacing with the CL-PD6710

Figure 1 is a schematic diagram showing the LTC1470 interfaced with a standard PCMCIA slot controller. The LTC1470 accepts logic control directly from the CL-PD6710.

The XOR input function allows the LTC1470 to interface directly to the active-low  $V_{CC}$  control outputs of the CL-PD6710 for 3.3V/5V voltage selection (see the following Switch Truth Table). Therefore, no "glue" logic is required to interface to this PCMCIA compatible card controller.

Figure 1. Direct Interface to CL-PD6710 PCMCIA Controller

## APPLICATIONS INFORMATION

Truth Table for CL-PD6710 Controller

| A_V <sub>CC_3</sub> | A_V <sub>CC_5</sub> | OUT  |
|---------------------|---------------------|------|
| EN0                 | EN1                 |      |
| 0                   | 0                   | Hi-Z |
| 0                   | 1                   | 3.3V |
| 1                   | 0                   | 5V   |
| 1                   | 1                   | Hi-Z |

### Interfacing with “365” Type Controllers

The LTC1470 also interfaces directly with “365” type controllers as shown in Figure 2. Note that the V<sub>CC</sub> Enable inputs are connected differently than to the CL-PD6710 controller because the “365” type controllers use active-high logic control of the V<sub>CC</sub> switches (see the following Switch Truth Table). No “glue” logic is required to interface to this type of PCMCIA compatible controller.

Figure 2. Direct Interface with “365” Type PCMCIA Controller

Truth Table for “365” Type Controller

| A_V <sub>CC_EN0</sub> | A_V <sub>CC_EN1</sub> | OUT  |
|-----------------------|-----------------------|------|
| EN0                   | EN1                   |      |
| 0                     | 0                     | Hi-Z |
| 0                     | 1                     | 3.3V |
| 1                     | 0                     | 5V   |
| 1                     | 1                     | Hi-Z |

### Supply Bypassing

For best results bypass the supply input pins with 1µF capacitors as close as possible to the LTC1470. Sometimes much larger capacitors are already available at the outputs of the 3.3V and 5V power supply. In this case it is still good practice to use 0.1µF capacitors as close as possible to the device, especially if the power supply output capacitors are more than 2" away on the printed circuit board.

### Output Capacitors and Pull-Down Resistor

The output pin is designed to ramp on slowly, typically 400µs rise time. Therefore, capacitors as large as 150µF can be driven without producing voltage spikes on the 3V<sub>IN</sub> or 5V<sub>IN</sub> supply pins (see graphs in Typical Performance Characteristics section). The output pin should have a 0.1µF to 1µF capacitor for noise reduction and smoothing.

A 10k pull-down resistor is recommended at the output to ensure that the output capacitor is fully discharged when the output is switched OFF. This resistor also ensures that the output is discharged between the 3.3V and 5V transition.

### Supply Sequencing

Because the 5V supply is the source of power for both of the switch control circuits, it is best to sequence the power supplies such that the 5V supply is powered before, or simultaneous to, the application of 3.3V.

It is interesting to note, however, that the switches are NMOS transistors which require charge pumps to generate gate voltages higher than the supply rails for full enhancement. Because the gate voltages start at 0V when the supplies are first activated, the switches always start in the off state and do not produce glitches at the outputs when powered.

If the 5V supply must be turned off, it is important to program all switches to the Hi-Z or 0V state at least 100µs before the 5V power is removed to ensure that the NMOS switch gates are fully discharged to 0V. Whenever possible, however, it is best to leave the 5V<sub>IN</sub> pin(s) continuously powered. The LTC1470/LTC1471 quiescent current drops to <1µA with all the switches turned off and therefore no 5V power is consumed in the standby mode.

## APPLICATIONS INFORMATION

winding is rectified by diode D2, added to the main 5V output and applied to the input of the LT1313. (Note that the auxiliary winding must be phased properly as shown in Figure 3.)

When the 12V output is activated by a TTL high on either VPP enable lines, the 5V section of the LTC1142HV is forced into continuous mode operation. A resistor divider composed of R2, R3 and switch Q3 forces an offset which is subtracted from the internal offset at the Sense<sup>-</sup> input (pin 14) of the LTC1142HV. When this external offset cancels the built-in 25mV offset, Burst Mode™ operation is inhibited and the LTC1142HV is forced into continuous mode operation. (See LTC1142HV data sheet for further detail.) In this mode, the 15V auxiliary supply can be loaded without regard to the loading on the 5V output of the LTC1142HV.

Continuous mode operation is only invoked when the LT1313 is programmed to 12V. If the LT1313 is programmed to 0V, 3.3V or 5V, power is obtained directly from the main power source (battery pack) through diode D1. Again, the LT1313 output can be loaded without regard to the loading of the main 5V output.

R4 and C4 absorb transient voltage spikes associated with the leakage inductance inherent in T1's secondary winding and ensure that the auxiliary supply does not exceed 20V.

### Auxiliary Power from the LTC1142 3.3V Output

For low-battery count applications (<6.5V) it is necessary to modify the circuit of Figure 3. As the input voltage falls, the 5V duty cycle increases to the point where there is simply not enough time to transfer energy from the 5V primary winding to the auxiliary winding. For applications where 12V load currents exist in conjunction with these low input voltages, use the circuit shown in Figure 4. In this circuit, the auxiliary 15V supply is generated from an overwinding on the 3.3V inductor of the LTC1142 regulator output.

In Figure 3, power is drawn directly from the batteries through D1 when the regulator is in Burst Mode operation and the VPP pins require 3.3V or 5V. In this circuit, however, Q3 and Q4 force the LTC1142 3.3V regulator into continuous mode operation whenever 3.3V, 5V or 12V is programmed at the VPP<sub>OUT</sub> pins of the LT1313. (See the LT1312 and LT1313 data sheets for further detail.)

Burst Mode is a trademark of Linear Technology Corporation.

| PART NUMBER                                      | DESCRIPTION                                                                                          | COMMENTS                                                                                                                           |
|--------------------------------------------------|------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| LTC3405/LTC3405A<br>LTC3405A-1.5<br>LTC3405A-1.8 | 300mA ( $I_{OUT}$ ), 1.5MHz, Synchronous Step-Down DC/DC Converters                                  | 95% Efficiency, $V_{IN}$ = 2.7V to 6V, $V_{OUT}$ = 0.8V, $I_Q$ = 20 $\mu$ A<br>$I_{SD}$ = <1 $\mu$ A, ThinSOT Package              |
| LTC3406/LTC3406B                                 | 600mA ( $I_{OUT}$ ) 1.5MHz, Synchronous Step-Down DC/DC Converter                                    | 95% Efficiency, $V_{IN}$ = 2.5V to 5.5V, $V_{OUT}$ = 0.6V, $I_Q$ = 20 $\mu$ A<br>$I_{SD}$ = <1 $\mu$ A, ThinSOT Package            |
| LTC3411                                          | 1.25A ( $I_{OUT}$ ), 4MHz, Synchronous Step-Down DC/DC Converter                                     | 95% Efficiency, $V_{IN}$ = 2.5V to 5.5V, $V_{OUT}$ = 0.8V, $I_Q$ = 60 $\mu$ A<br>$I_{SD}$ = <1 $\mu$ A, MS10 Package               |
| LTC3412                                          | 2.5A ( $I_{OUT}$ ), 4MHz, Synchronous Step-Down DC/DC Converter                                      | 95% Efficiency, $V_{IN}$ = 2.5V to 5.5V, $V_{OUT}$ = 0.8V, $I_Q$ = 60 $\mu$ A<br>$I_{SD}$ = <1 $\mu$ A, TSSOP16E Package           |
| LTC3413                                          | 3A ( $I_{OUT}$ ), Sink/Source, 2MHz, Monolithic Synchronous Regulator for DDR/QDR Memory Termination | 90% Efficiency, $V_{IN}$ = 2.25V to 5.5V, $V_{OUT}$ = $V_{REF}/2$ , $I_Q$ = 280 $\mu$ A<br>$I_{SD}$ = <1 $\mu$ A, TSSOP16E Package |
| LT3430                                           | 60V, 2.75A ( $I_{OUT}$ ), 200kHz, High Efficiency Step-Down DC/DC Converter                          | 90% Efficiency, $V_{IN}$ = 5.5V to 60V, $V_{OUT}$ = 1.20V, $I_Q$ = 2.5mA<br>$I_{SD}$ = 25 $\mu$ A, TSSOP16E Package                |
| LTC3440                                          | 600mA ( $I_{OUT}$ ), 2MHz, Synchronous Buck-Boost DC/DC Converter                                    | 95% Efficiency, $V_{IN}$ = 2.5V to 5.5V, $V_{OUT}$ = 2.5V, $I_Q$ = 25 $\mu$ A<br>$I_{SD}$ = <1 $\mu$ A, MS Package                 |
