

AS1747, AS1748, AS1749, AS1750

Low-Voltage, Dual SPDT, Audio Clickless Switches with Negative Rail Capability

1 General Description

The SPDT (single-pole/double-throw) switches AS1747, AS1748, AS1749 and AS1750 allow signals below ground to pass through without distortion. These analog switches are ideal for switching audio signals, due to their supply voltage from +1.8V to +5.5V and their low 0.4Ω on-resistance.

An included comparator offers the AS1748 and AS1750 with headphone detection or mute/send key function.

To reduce click-and-pop sounds when switching between pre-charged points the AS1749 and AS1750 have an internal shunt switch. This shunt switch automatically discharges any capacitance at the NO and NC connection points.

This SPDT switch is available in space-saving 10-pin TDFN 3x3 packages and operate over the -40°C to +85°C extended temperature range.

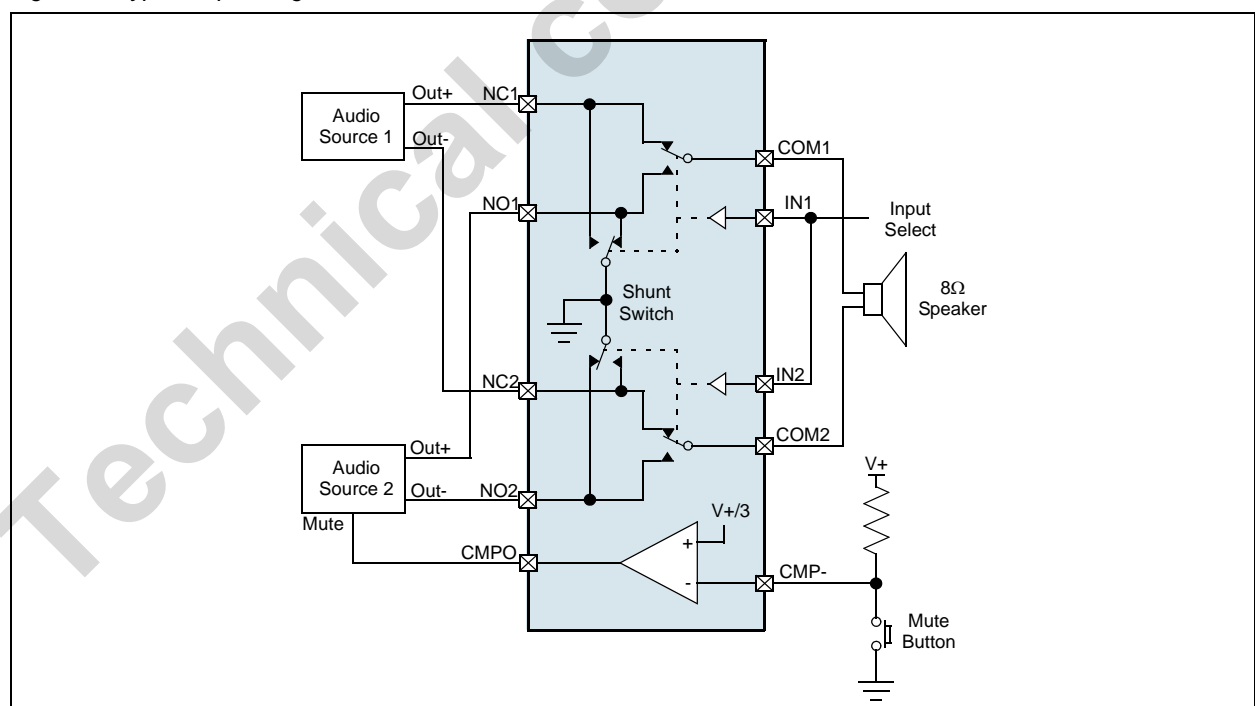

2 Key Features

- Distortion -Free Negative Signal Throughput Down to $V_{CC} - 5.5V$
- Comparator for Headphone or Mute Detection (AS1748/AS1750)
- Internal Shunt Resistor Reduces Click/Pop (AS1749/AS1750)
- Low On-Resistance (R_{ON})
0.4Ω at +2.7V Supply
- 0.25Ω On-Resistance Flatness
- 0.03Ω On-Resistance Matching
- +1.8V to +5.5V Supply Voltage
- -90dB Crosstalk (100kHz)
- -65dB Off-Isolation (100kHz)
- 0.01% Total Harmonic Distortion
- Available in 10-pin TDFN 3x3, 16-pin TQFN 3x3, and 12-Bump WL-CSP Packages

3 Applications

The device is ideal for cell phones, PDAs and hand-held devices, notebook computers and MP3 players.

5 Absolute Maximum Ratings

Stresses beyond those listed in [Table 3](#) may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in [Electrical Characteristics on page 5](#) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 3. Absolute Maximum Ratings

Parameter	Min	Max	Units	Comments
V _{CC} , IN ₋ , CMP-	-0.3	+6.0	V	
COM ₋ , NO ₋ , NC ₋	V _{CC} - 6	V _{CC} + 0.3	V	
CMPO	0.3	V _{CC} + 0.3	V

8 Detailed Description

The AS1747– AS1750 are operating from a +1.8V to +5.5V supply and feature a negative signal capability that allows signals below ground to pass through without distortion. A break-before-make switching and a low on-resistance are also included in this analog dual SPDT switches. The device is fully specified for a 3.0V application.

A headphone or mute detection is included in the AS1748 and AS1750. This function is realized with a comparator which has an internally generated threshold of about 1/3 of V_{CC} . To reduce click-and-pop sounds when switching between precharged points the AS1749 and AS1750 have an internal shunt switch. This shunt switch automatically discharges any capacitance at the NO and NC connection points.

9 Application Information

Digital Control Inputs

The logic inputs of the AS1747– AS1750 accept up to +5.5V independent of the supply voltage. Due to this a mixing of the logic levels in a system is possible. For example, with a +3.3V supply, IN_{-} can be driven low to GND and high to +5.5V. For a +1.8V supply voltage, the logic levels are 0.5V (low) and 1.4V (high); for a +5V supply voltage, the logic levels are 0.8V (low) and 2.0V (high).

Analog Signal Levels

The change of the on-resistance of the AS1747– AS1750 is very little for analog input signals over the whole supply voltage range. The switches are bi-directional, so the NO_{-} , NC_{-} , and COM_{-} pins can be either inputs or outputs.

The AS1747– AS1750 pass signals as low as $V_{CC} - 5.5V$, including signals below ground with minimal distortion.

Comparator (AS1748¹/AS1750)

To implement a mute and headphone function, a comparator is included in the AS1748 and AS1750. The negative terminal of this comparator is connected to the outside (via pin CMP_{-}) while the positive terminal is internally set to $V_{CC}/3$. The output of the comparator ($CMPO$) is logic high when the negative terminal (CMP_{-}) is below the threshold. $CMPO$ is logic low when CMP_{-} is higher than $V_{CC}/3$.

Headphone audio signals are typical biased to $V_{CC}/2$ so a comparator threshold of $V_{CC}/3$ is sufficient for the headphone detection.

Shunt Switch (AS1749¹/AS1750)

Due to the switching between audio sources, audible click-and-pop sounds occur. To reduce this sounds a 100Ω shunt switch is implemented in the AS1749 and AS1750. This shunt switch automatically discharges any capacitance at the NC_{-} or NO_{-} terminals when they are unconnected to COM_{-} .

Audible clicks and pops are caused when a step DC voltage is switched into the speaker. By automatically discharging the side that is not connected, any residual DC voltage is removed, thereby reducing the clicks and pops.

Power-Supply Sequencing and Overvoltage Protection

Caution: Stresses beyond the listed absolute maximum ratings in [Table 3 on page 4](#) may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Proper power-supply sequencing is recommended for all CMOS devices. Always apply V_{CC} before applying analog signals, especially if the analog signal is not current-limited.
