

Typical Applications Circuit (Note 4)

Note 4: 120µF output capacitance is a requirement of USB.

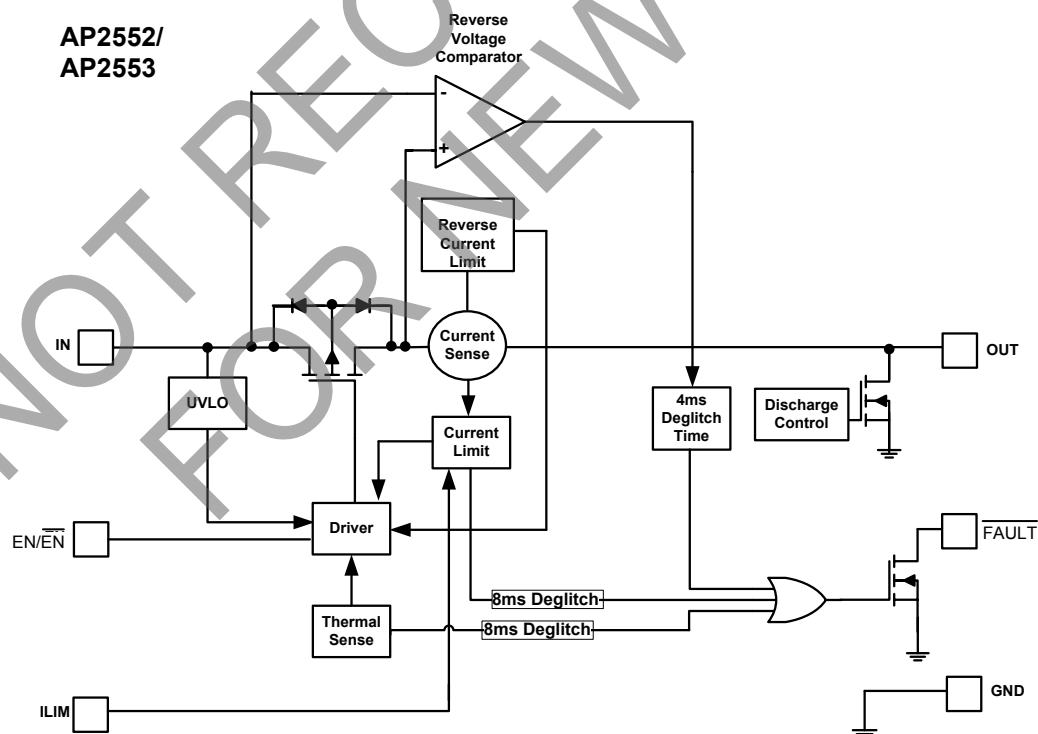

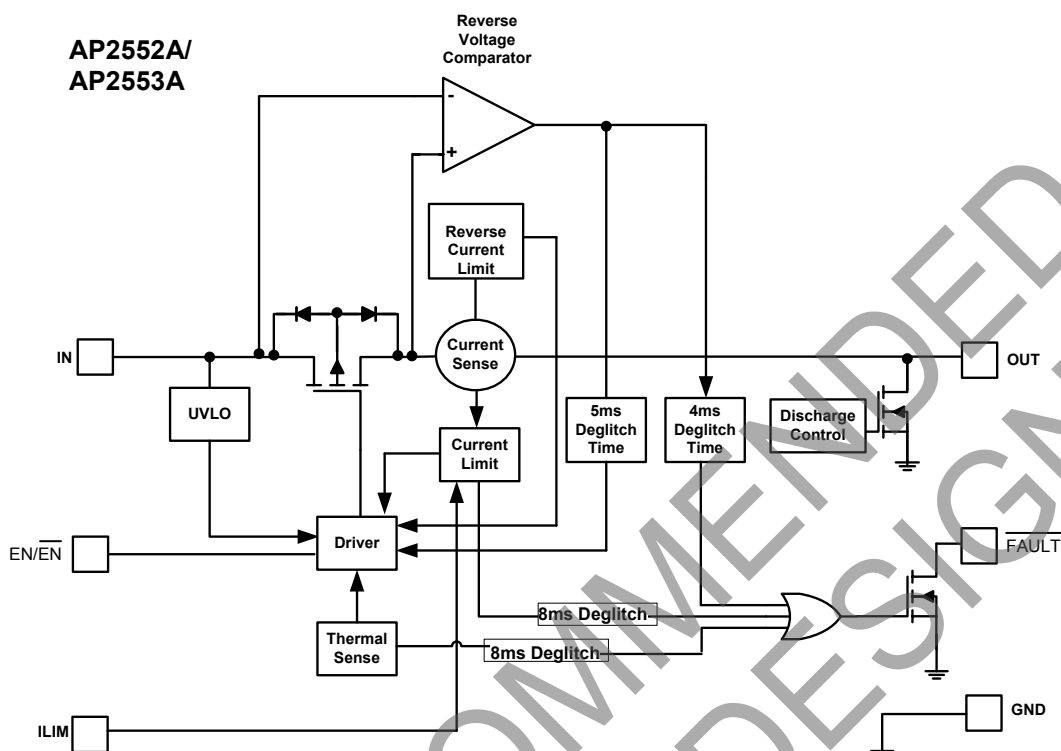

Available Options

Part Number	Channel	Enable Pin (EN/EN)	Recommended Maximum Continuous Load Current (A)	Current-Limit Protection	Package
AP2552	1	Active Low	2.1	Constant-Current	U-DFN2020-6 (Type C) SOT26
AP2553	1	Active High			
AP2552A	1	Active Low	2.1	Latch-Off	U-DFN2020-6 (Type C) SOT26
AP2553A	1	Active High			

Pin Descriptions

Pin Name	Pin Number				I/O	Function
	SOT26		U-DFN2020-6 (Type C)			
	AP2552/ AP2552A	AP2553/ AP2553A	AP2552/ AP2552A	AP2553/ AP2553A		
IN	1	1	6	6	I	Input, connect a 0.1μF or greater ceramic capacitor from IN to GND as close to IC as possible.
GND	2	2	5	5	—	Ground, connect to external exposed pad.
$\overline{\text{EN}}$	3	—	4	—	I	Enable input, logic low turns on power switch.
EN	—	3	—	4	I	Enable input, logic high turns on power switch.
$\overline{\text{FAULT}}$	4	4	3	3	O	Active-low open-drain output, asserted during over-current, over-temperature, or reverse-voltage conditions.
ILIM	5	5	2	2	O	Use external resistor to set current-limit threshold; recommended $10\text{k}\Omega \leq R_{\text{LIM}} \leq 210\text{k}\Omega$.
OUT	6	6	1	1	O	Output
Exposed Pad	—	—	Pad	Pad	—	No internal connection; recommend to connect to GND externally for improved power dissipation. It should not be used as electrical ground conduction path.

Functional Block Diagram

Absolute Maximum Ratings (@T_A = +25°C, unless otherwise specified.)

Symbol	Parameter	Ratings	Unit
ESD	HBM	Human Body Model ESD Protection	2
	CDM	Charged Device Model ESD Protection	500
	IEC System Level	Surges per IEC61000-4-2. 1999 Applied to Output Terminals of EVM (Note 6)	15
V _{IN} , V _{OUT} , V _{FAULT} , V _{ILIM} , V _{EN} , V _{EN}	Voltage on IN, OUT, FAULT, ILIM, EN, EN	-0.3 to +6.5	V
—	Continuous FAULT Sink Current	25	mA
—	ILIM Source Current	1	mA
I _{LOAD}	Maximum Continuous Load Current	Internal Limited	A
T _{J(MAX)}	Maximum Junction Temperature	-40 to +150	°C
T _{STG}	Storage Temperature Range (Note 5)	-65 to +150	°C

Notes: 5. UL Recognized Rating from -30°C to +70°C (Diodes Incorporated qualified T_{STG} from -65°C to +150°C).
6. External capacitors need to be connected to the output, EVM board was tested with capacitor 2.2µF 50V 0805. This level is a pass test only and not a limit.

Caution: Stresses greater than the 'Absolute Maximum Ratings' specified above, can cause permanent damage to the device. These are stress ratings only; functional operation of the device at these or any other conditions exceeding those indicated in this specification is not implied. Device reliability can be affected by exposure to absolute maximum rating conditions for extended periods of time.

Semiconductor devices are ESD sensitive and can be damaged by exposure to ESD events. Suitable ESD precautions should be taken when handling and transporting these devices.

Dissipation Rating Table

Board	Package	Thermal Resistance θ _{JA}	Thermal Resistance θ _{Jc}	T _A ≤ +25°C Power Rating	Derating Factor Above T _A = +25°C	T _A = +70°C Power Rating	T _A = +85°C Power Rating
High-K (Note 7)	SOT26	160°C/W	55°C/W	625mW	6.25mW/°C	340mW	250mW
High-K (Note 7)	U-DFN2020-6 (Type C)	120°C/W	34°C/W	833mW	8.33mW/°C	450mW	330mW

Note: 7. The JEDEC high-K (2s2p) board used to derive this data was a 3inch × 3inch, multilayer board with 1oz internal power and ground planes with 2oz copper traces on top and bottom of the board.

Recommended Operating Conditions (@T_A = +25°C, unless otherwise specified.)

Symbol	Parameter	Min	Max	Unit

Application Information

The AP2552/53 and AP2552A/53A are integrated high-side power switches optimized for Universal Serial Bus (USB) that require protection functions. The power switches are equipped with a driver that controls the gate voltage and incorporates slew-rate limitation. This, along with the various protection features and special functions, makes these power switches ideal for hot-swap or hot-plug applications.

Protection Features

Under-Voltage Lockout (UVLO)

Whenever the input voltage falls below UVLO threshold (~2.5V), the power switch is turned off. This facilitates the design of hot-insertion systems where it is not possible to turn off the power switch before input power is removed.

Over-Current and Short-Circuit Protection

An internal sensing FET is employed to check for over-current conditions. Unlike current-sense resistors, sense FETs do not increase the series resistance of the current path. When an overcurrent condition is detected, AP2552/53 maintains a constant output current and reduces the output voltage accordingly. Complete shutdown occurs only if the fault stays long enough to activate thermal limiting.

For AP2552A/53A, when an overcurrent condition is detected, the devices will limit the current until the overload condition is removed or the internal deglitch time (7ms typical) is reached, and AP2552A/53A will be turned off. AP2552A/53A will remain latched off until power is cycled or the device enable is toggled.

The different overload conditions and the corresponding response of the AP2552/53 and AP2552A/53A are outlined below:

NO	Conditions	Explanation	Behavior of the AP2552/53
1	Short-circuit condition at start-up	Output is shorted before input voltage is applied or before the part is enabled	The IC senses the short circuit and immediately clamps output current to a certain safe level namely I_{SHORT} .
2	Short-circuit or overcurrent condition	Short-Circuit or Overload condition that occurs when the part is enabled.	<ul style="list-style-type: none"> At the instance the overload occurs, higher current may flow for a very short period of time before the current limit function can react. After the current limit function has tripped (reached the over-current trip threshold), the device switches into current limiting mode and the current is clamped at I_{SHORT} / I_{LIMIT}.
3	Gradual increase from nominal operating current to I_{LIMIT}	Load increases gradually until the current-limit threshold. (I_{TRIG})	The current rises until I_{LIMIT} or thermal limit. Once the threshold has been reached, the device switches into its current limiting mode and is set at I_{LIMIT} .

NO	Conditions	Explanation	Behavior of the AP2552A/53A
1	Short-circuit condition at start-up	Output is shorted before input voltage is applied or before the part is enabled	The IC senses the short circuit and immediately clamps output current to a certain safe level namely I_{SHORT} . When the internal deglitch time (7ms typical) is reached and the devices will be turned off.
2	Short-circuit or overcurrent condition	Short-Circuit or Overload condition that occurs when the part is enabled.	<ul style="list-style-type: none"> At the instance the overload occurs, higher current may flow for a very short period of time before the current limit function can react. After the current limit function has tripped (reached the over-current trip threshold), the device switches into current limiting mode and the current is clamped at I_{SHORT} / I_{LIMIT}. When the internal deglitch time (7ms typical) is reached and the devices will be turned off.
3	Gradual increase from nominal operating current to I_{LIMIT}	Load increases gradually until the current-limit threshold. (I_{TRIG})	The current rises until I_{LIMIT} or thermal limit. Once the threshold has been reached, the device switches into its current limiting mode and is set at I_{LIMIT} . When the internal deglitch time (7ms typical) is reached and the devices will be turned off.

Over-Current FAULT Signal

The FAULT signal could be asserted in response to OCP before the device reaches its current limit. The output current upon FAULT signal triggered will be lower than the I_{LIMIT} value. To implement FAULT signal for precision system protection control, it is recommended to leave enough margin from maximum continuous operating current for each R_{LIM} value condition. For latch-off version, when over current is detected, device current will be clamped and device will latch off once FAULT signal asserted. To implement FAULT signal for precision system protection control, leave enough margin from maximum continuous operating current is highly recommended. Please consult Diodes Incorporated representative about margin recommendation for each R_{LIM} value condition.

Application Information (continued)

Current-Limit Threshold Programming

The current-limit threshold can be programmed using an external resistor. The current-limit threshold is proportional to the current sourced out of I_{LIM} .

The recommended 1% resistor range for R_{LIM} is $10k\Omega \leq R_{LIM} \leq 210k\Omega$. Figure 15 includes current-limit tolerance due to variations caused by temperature and process. This graph does not include the external resistor tolerance. The traces routing the R_{LIM} resistor to the AP2552/53 and AP2552A/53A should be as short as possible to reduce parasitic effects on the current-limit accuracy.

To design below a maximum current-limit threshold, find the intersection of R_{LIM} and the maximum desired load current on the $I_{LIM(MAX)}$ (I_{LIM}) curve and choose a value of R_{LIM} above this value. Programming the current limit below a maximum threshold is important to avoid current limiting upstream power supplies causing the input voltage bus to droop. The resulting minimum current-limit threshold is the intersection of the selected value of R_{LIM} and the $I_{LIM(MIN)}$ (I_{LIM}) curve.

Best Fit Current-Limit Threshold Equations ($I_{LIM(TYP)}$):

$$I_{LIM(MAX)}(mA) = \frac{20.08}{R_{LIM}^{0.904} k\Omega}$$

$$I_{LIM(TYP)}(mA) = \frac{19.94}{R_{LIM}^{0.925} k\Omega}$$

$$I_{LIM(MIN)}(mA) = \frac{20.26}{R_{LIM}^{0.956} k\Omega}$$

Figure 15. Current-Limit Threshold vs. R_{LIM}

Thermal Protection

Thermal protection prevents the IC from damage when the die temperature exceeds safe margins. This mainly occurs when heavy-overload or short-circuit faults are present for extended periods of time. The AP2552/53 and AP2552A/53A implements a thermal sensing to monitor the operating junction temperature of the power distribution switch. Once the die temperature rises to approximately $+160^{\circ}\text{C}$ ($+140^{\circ}\text{C}$ in case the part is under current limit), the thermal protection feature activates as follows: The internal thermal sense circuitry turns the power switch off and the FAULT output is asserted, thus preventing the power switch from damage. Hysteresis in the thermal sense circuit allows the device to cool down by approximately $+20^{\circ}\text{C}$ before the output is turned back on. This built-in thermal hysteresis feature is an excellent feature, as it avoids undesirable oscillations of the thermal protection circuit. The switch continues to cycle in this manner until the load fault is removed, resulting in a pulsed output.

Application Information (continued)

Reverse-Current and Reverse-Voltage Protection

The USB specification does not allow an output device to source current back into the USB port. In a normal MOSFET switch, current will flow in reverse direction (from the output side to the input side) when the output side voltage is higher than the input side. A reverse-current limit (ROCP) feature is implemented in the AP2552/53 and AP2552A/53A to limit such back currents. The ROCP circuit is activated when the output voltage is higher than the input voltage. After the reverse current circuit has tripped (reached the reverse current trip threshold), the current is clamped at this IROCP level.

In addition to ROCP, reverse over-voltage protection (ROVP) is also implemented. The ROVP circuit is activated by the reverse voltage comparator trip point; i.e., the difference between the output voltage and the input voltage.

For AP2552/53, once ROVP is activated, FAULT assertion occurs at a de-glitch time of 4ms. Recovery from ROVP is automatic when the fault is removed. FAULT de-assertion de-glitch time is same as the de-assertion time.

For AP2552A/53A, once ROVP is activated and when the condition exists for more than 5ms (Typ.), output device is disabled and shut down. This is called the "Time from Reverse-Voltage Condition to MOSFET Turn Off". FAULT assertion occurs at a de-glitch time of 4ms after ROVP is reached. Recovery from this fault is achieved by recycling power or toggling EN. FAULT de-assertion de-glitch time is same as the de-assertion time.

Special Functions

Discharge Function

When enable is de-asserted, or when the input voltage is under UVLO level, the discharge function is active. The output capacitor is discharged through an internal NMOS that has a discharge resistance of 100Ω. Hence, the output voltage drops down to zero. The time taken for discharge is dependent on the RC time constant of the resistance and the output capacitor.

FAULT Response

The FAULT open-drain output goes active low for any of following faults: Current limit threshold, short-circuit current limit, reverse-voltage condition or thermal shutdown. The time from when a fault condition is encountered to when the FAULT output goes low is 7ms (Typ.). The FAULT output remains low until over-current, short-circuit current limit and over-temperature conditions are removed. Connecting a heavy capacitive load to the output of the device can cause a momentary over-current condition, which does not trigger the FAULT due to the 7ms deglitch timeout. This 7ms timeout is also applicable for over-current recovery and over-temperature recovery. The AP2552/53 and AP2552A/53A are designed to eliminate erroneous over-current reporting without the need for external components, such as an RC delay network.

For the AP2552/53 and AP2552A/53A when the reverse voltage condition is triggered, FAULT output goes low after 4ms (Typ.). This 4ms (Typ.) timeout is also applicable for the recovery from reverse voltage fault.

When the ILIM pin is shorted to IN or GND, current-limit threshold and short-circuit current limit will be clamped at typically 75mA. When the ILIM pin is shorted to IN or GND, the AP2552/53 and AP2552A/53A FAULT pin will not assert during current limiting conditions; The FAULT pin will assert during short circuit conditions.

For latch-off version, once Fault signal is triggered, device will stay off until EN pin is toggled or power is restarted.

Power Supply Considerations

A 0.01μF to 0.1μF X7R or X5R ceramic bypass capacitor between IN and GND, close to the device, is recommended. This limits the input voltage drop during line transients. Placing a high-value electrolytic capacitor on the input (10μF minimum) and output pin (120μF) is recommended when the output load is heavy. This precaution also reduces power-supply transients that may cause ringing on the input. Additionally, bypassing the device output with a 0.1μF to 4.7μF ceramic capacitor improves the immunity of the device to short-circuit transients. This capacitor also prevents output from going negative during turn-off due to parasitic inductance.

Power Dissipation and Junction Temperature

The low on-resistance of the internal MOSFET allows the small surface-mount packages to pass large current. Using the maximum operating ambient temperature (T_A) and $R_{DS(ON)}$, the power dissipation can be calculated by:

$$P_D = R_{DS(ON)} \times I^2$$

Finally, calculate the junction temperature:

$$T_J = P_D \times \theta_{JA} + T_A$$

Where:

T_A = Ambient temperature °C

θ_{JA} = Thermal resistance

P_D = Total power dissipation

Application Information (continued)

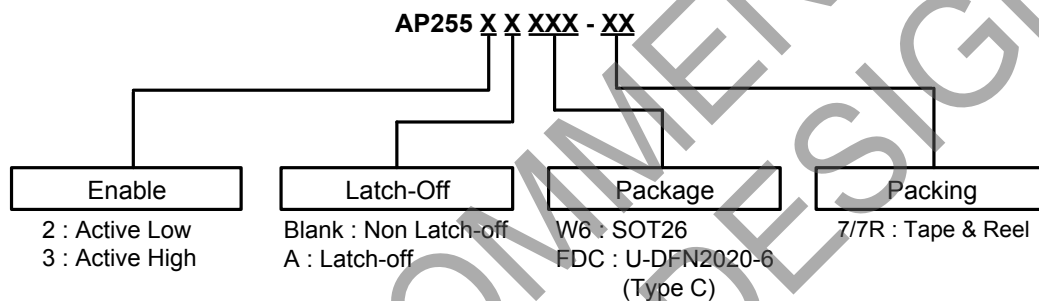

Generic Hot-Plug Applications

In many applications it may be necessary to remove modules or PC boards while the main unit is still operating. These are considered hot-plug applications. Such implementations require the control of current surges seen by the main power supply and the card being inserted. The most effective way to control these surges is to limit and slowly ramp the current and voltage being applied to the card, similar to the way in which a power supply normally turns on. Due to the controlled rise and fall time of the AP2552/53 and AP2552A/53A, these devices can be used to provide a softer start-up to devices being hot-plugged into a powered system. The UVLO feature of the AP2552/53 and AP2552A/53A also ensures that the switch is off after the card has been removed, and that the switch is off during the next insertion.

Generic Hot-Plug Applications

By placing the AP2552/53 and AP2552A/53A between the V_{CC} input and the rest of the circuitry, the input power reaches these devices first after insertion. The typical rise time of the switch is approximately 1ms, providing a slow voltage ramp at the output of the device. This implementation controls system surge current and provides a hot-plugging mechanism for any device.

Note: 10. The taping orientation of the other package type can be found on our website at <https://www.diodes.com/assets/Packaging-Support-Docs/Ap02007.pdf>.

IMPORTANT NOTICE

DIODES INCORPORATED MAKES NO WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, WITH REGARDS TO THIS DOCUMENT, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION).

Diodes Incorporated and its subsidiaries reserve the right to make modifications, enhancements, improvements, corrections or other changes without further notice to this document and any product described herein. Diodes Incorporated does not assume any liability arising out of the application or use of this document or any product described herein; neither does Diodes Incorporated convey any license under its patent or trademark rights, nor the rights of others. Any Customer or user of this document or products described herein in such applications shall assume all risks of such use and will agree to hold Diodes Incorporated and all the companies whose products are represented on Diodes Incorporated website, harmless against all damages.

Diodes Incorporated does not warrant or accept any liability whatsoever in respect of any products purchased through unauthorized sales channel. Should Customers purchase or use Diodes Incorporated products for any unintended or unauthorized application, Customers shall indemnify and hold Diodes Incorporated and its representatives harmless against all claims, damages, expenses, and attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized application.

Products described herein may be covered by one or more United States, international or foreign patents pending. Product names and markings noted herein may also be covered by one or more United States, international or foreign trademarks.

This document is written in English but may be translated into multiple languages for reference. Only the English version of this document is the final and determinative format released by Diodes Incorporated.

LIFE SUPPORT

Diodes Incorporated products are specifically not authorized for use as critical components in life support devices or systems without the express written approval of the Chief Executive Officer of Diodes Incorporated. As used herein:

A. Life support devices or systems are devices or systems which:

1. are intended to implant into the body, or
2. support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in significant injury to the user.

B. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or to affect its safety or effectiveness.

Customers represent that they have all necessary expertise in the safety and regulatory ramifications of their life support devices or systems, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of Diodes Incorporated products in such safety-critical, life support devices or systems, notwithstanding any devices- or systems-related information or support that may be provided by Diodes Incorporated. Further, Customers must fully indemnify Diodes Incorporated and its representatives against any damages arising out of the use of Diodes Incorporated products in such safety-critical, life support devices or systems.
