

1. Feature List

The LG highlighted features are listed below.

MCU Features

- ARM Cortex-M3 CPU platform
 - Up to 48 MHz
 - 64/128/256 kB Flash with 32 kB RAM
 - Hardware AES with 128/256-bit keys
- Flexible Energy Management System
 - 20 nA @ 3 V Shutoff Mode
 - 0.65 μ A @ 3 V Stop Mode
 - 211 μ A/MHz @ 3 V Run Mode
- Timers/Counters
 - 4 \times Timer/Counter
 - 4 \times 3 Compare/Capture/PWM channels
 - Low Energy Timer
 - Real-Time Counter
 - 16/8-bit Pulse Counter
 - Watchdog Timer
- Communication interfaces
 - 2 \times USART (UART/SPI)
 - 2 \times UART
 - 2 \times Low Energy UART
 - 2 \times I2C Interface with SMBus support
 - Universal Serial Bus (USB)
- Ultra low power precision analog peripherals
 - 12-bit 1 Msamples/s ADC
 - On-chip temperature sensor
 - 12-bit 500 ksamples/s DAC
 - 2 \times Analog Comparator
 - 2 \times Operational Amplifier
- Low Energy Sensor Interface (LESENSE)
- Up to 38 General Purpose I/O pins

RF Features

- Frequency Range
 - 142-1050 MHz
- Modulation
 - (G)FSK, 4(G)FSK, (G)MSK, OOK
- Receive sensitivity up to -133 dBm
- Up to +20 dBm max output power
- Low active power consumption
 - 10/13 mA RX
 - 18 mA TX at +10 dBm
 - 6 mA @ 1.2 kbps (Preamble Sense)
- Data rate = 100 bps to 1 Mbps
- Excellent selectivity performance
 - 69 dB adjacent channel
 - 79 dB blocking at 1 MHz
- Antenna diversity and T/R switch control
- Highly configurable packet handler
- TX and RX 64 byte FIFOs
- Automatic frequency control (AFC)
- Automatic gain control (AGC)
- IEEE 802.15.4g compliant

System Features

- Power-on Reset and Brown-Out Detector
- Debug Interface
- Temperature range -40 to 85 °C
- Single power supply 1.98 to 3.8 V
- QFN64 package

2. Ordering Information

3. System Overview

3.1 Introduction

The EZR32LG330 Wireless MCUs are the latest in the Silicon Labs family of wireless MCUs delivering a high-performance, low-energy wireless solution integrated into a small form factor package. By combining a high performance sub-GHz RF transceiver with an energy efficient 32-bit ARM Cortex-M3, the EZR32LG family provides designers with the ultimate in flexibility with a family of pin-compatible parts that scale from 64 to 256 kB of flash and support Silicon Labs EZRadio or EZRadioPRO transceivers. The ultra-low power operating modes and fast wake-up times combined with the low transmit and receive power consumption of the sub-GHz radio result in a solution optimized for low power and battery powered applications. For a complete feature set and in-depth information on the modules, refer to the [EZR32LG Reference Manual](#).

The EZR32LG330 block diagram is shown below.

Figure 3.1. Block Diagram

3.1.1 ARM Cortex-M3 Core

The ARM Cortex-M3 includes a 32-bit RISC processor which can achieve as much as 1.25 Dhrystone MIPS/MHz. A Memory Protection Unit with support for up to 8 memory segments is included, as well as a Wake-up Interrupt Controller handling interrupts triggered while the CPU is asleep. The EZR32 implementation of the Cortex-M3 is described in detail in the EZR32 Cortex-M3 Reference Manual.

3.1.2 Debugging

These devices include hardware debug support through a 2-pin serial-wire debug interface and an Embedded Trace Module (ETM) for data/instruction tracing. In addition there is also a 1-wire Serial Wire Viewer pin which can be used to output profiling information, data trace and software-generated messages.

3.1.3 Memory System Controller (MSC)

The Memory System Controller (MSC) is the program memory unit of the EZR32LG microcontroller. The flash memory is readable and writable from both the Cortex-M3 and DMA. The flash memory is divided into two blocks: the main block and the information block. Program code is normally written to the main block. Additionally, the information block is available for special user data and flash lock bits. There is also a read-only page in the information block containing system and device calibration data. Read and write operations are supported in the energy modes EM0 and EM1.

3.1.4 Direct Memory Access Controller (DMA)

The Direct Memory Access (DMA) controller performs memory operations independently of the CPU. This has the benefit of reducing the energy consumption and the workload of the CPU, and enables the system to stay in low energy modes when moving, for instance, data from the USART to RAM or from the External Bus Interface to a PWM-generating timer. The DMA controller uses the PL230 μ DMA controller licensed from ARM.

3.1.5 Reset Management Unit (RMU)

The Reset Management Unit (RMU) is responsible for handling the reset functionality of the EZR32LG.

3.1.6 Energy Management Unit (EMU)

The Energy Management Unit (EMU) manages all the low energy modes (EM) in EZR32LG microcontrollers. Each energy mode manages if the CPU and the various peripherals are available. The EMU can also be used to turn off the power to unused SRAM blocks.

3.1.7 Clock Management Unit (CMU)

The Clock Management Unit (CMU) is responsible for controlling the oscillators and clocks on-board the EZR32LG. The CMU provides the capability to turn on and off the clock on an individual basis to all peripheral modules in addition to enable/disable and configure the available oscillators. The high degree of flexibility enables software to minimize energy consumption in any specific application by not wasting power on peripherals and oscillators that are inactive.

3.1.8 Watchdog (WDOG)

The purpose of the watchdog timer is to generate a reset in case of a system failure, to increase application reliability. The failure may, for example, be caused by an external event, such as an ESD pulse, or by a software failure.

3.1.9 Peripheral Reflex System (PRS)

The Peripheral Reflex System (PRS) system is a network which lets the different peripheral module communicate directly with each other without involving the CPU. Peripheral modules which send out Reflex signals are called producers. The PRS routes these reflex signals to consumer peripherals which apply actions depending on the data received. The format for the Reflex signals is not given, but edge triggers and other functionality can be applied by the PRS.

3.1.10 Universal Serial Bus Controller (USB)

The USB is a full-speed USB 2.0 compliant OTG host/device controller. The USB can be used in Device, On-the-go (OTG) Dual Role Device or Host-only configuration. In OTG mode the USB supports both Host Negotiation Protocol (HNP) and Session Request Protocol (SRP). The device supports both fullspeed (12 MBit/s) and low speed (1.5 MBit/s) operation. The USB device includes an internal dedicated Descriptor-Based Scatter/Gather DMA and supports up to 6 OUT endpoints and 6 IN endpoints, in addition to endpoint 0. The on-chip PHY includes all OTG features, except for the voltage booster for supplying 5 V to VBUS when operating as host.

3.1.11 Inter-Integrated Circuit Interface (I²C)

The I²C module provides an interface between the MCU and a serial I²C-bus. It is capable of acting as both a master and a slave, and supports multi-master buses. Both standard-mode, fast-mode and fast-mode plus speeds are supported, allowing transmission rates all the way from 10 kbit/s up to 1 Mbit/s. Slave arbitration and timeouts are also provided to allow implementation of an SMBus compliant system. The interface provided to software by the I²C module allows both fine-grained control of the transmission process and close to automatic transfers. Automatic recognition of slave addresses is provided in all energy modes.

3.1.12 Universal Synchronous/Asynchronous Receiver/Transmitter (USART)

The Universal Synchronous Asynchronous serial Receiver and Transmitter (USART) is a very flexible serial I/O module. It supports full duplex asynchronous UART communication as well as RS-485, SPI, MicroWire and 3-wire. It can also interface with ISO7816 Smart-Cards, and I2S devices.

3.1.13 Pre-Programmed UART Bootloader

The bootloader presented in application note, [AN0003: UART Bootloader](#), is pre-programmed in the device at the factory. Autobaud and destructive write are supported. The autobaud feature, interface, and commands are described further in the application note.

3.1.14 Universal Asynchronous Receiver/Transmitter (UART)

The Universal Asynchronous serial Receiver and Transmitter (UART) is a very flexible serial I/O module. It supports full- and half-duplex asynchronous UART communication.

3.1.15 Low Energy Universal Asynchronous Receiver/Transmitter (LEUART)

The unique Low Energy Universal Asynchronous Receiver/Transmitter (LEUART™), the Low Energy UART, is a UART that allows two-way UART communication on a strict power budget. Only a 32.768 kHz clock is needed to allow UART communication up to 9600 baud/s. The LEUART includes all necessary hardware support to make asynchronous serial communication possible with minimum of software intervention and energy consumption.

3.1.16 Timer/Counter (TIMER)

The 16-bit general purpose Timer has 3 compare/capture channels for input capture and compare/Pulse-Width Modulation (PWM) output. TIMER0 also includes a Dead-Time Insertion module suitable for motor control applications.

3.1.17 Real Time Counter (RTC)

The Real Time Counter (RTC) contains a 24-bit counter and is clocked either by a 32.768 kHz crystal oscillator, or a 32.768 kHz RC oscillator. In addition to energy modes EM0 and EM1, the RTC is also available in EM2. This makes it ideal for keeping track of time since the RTC is enabled in EM2 where most of the device is powered down.

3.1.18 Backup Real Time Counter (BURTC)

The Backup Real Time Counter (BURTC) contains a 32-bit counter and is clocked either by a 32.768 kHz crystal oscillator, a 32.768 kHz RC oscillator or a 1 kHz ULFRCO. The BURTC is available in all Energy Modes and it can also run in backup mode, making it operational even if the main power should drain out.

3.1.19 Low Energy Timer (LETIMER)

The unique LETIMER™, the Low Energy Timer, is a 16-bit timer that is available in energy mode EM2 in addition to EM1 and EM0. Because of this, it can be used for timing and output generation when most of the device is powered down, allowing simple tasks to be performed while the power consumption of the system is kept at an absolute minimum. The LETIMER can be used to output a variety of waveforms with minimal software intervention. It is also connected to the Real Time Counter (RTC), and can be configured to start counting on compare matches from the RTC.

3.1.20 Pulse Counter (PCNT)

The Pulse Counter (PCNT) can be used for counting pulses on a single input or to decode quadrature encoded inputs. It runs off either the internal LFACLK or the PCNTn_S0IN pin as external clock source. The module may operate in energy mode EM0 - EM3.

3.1.21 Analog Comparator (ACMP)

The Analog Comparator is used to compare the voltage of two analog inputs, with a digital output indicating which input voltage is higher. Inputs can either be one of the selectable internal references or from external pins. Response time and thereby also the current consumption can be configured by altering the current supply to the comparator.

3.1.22 Voltage Comparator (VCMP)

The Voltage Supply Comparator (VCMP) is used to monitor the supply voltage from software. An interrupt can be generated when the supply falls below or rises above a programmable threshold. Response time and thereby also the current consumption can be configured by altering the current supply to the comparator.

3.1.23 Analog to Digital Converter (ADC)

The Analog to Digital Converter (ADC) is a Successive Approximation Register (SAR) architecture, with a resolution of up to 12 bits at up to one million samples per second. The integrated input mux can select inputs from 8 external pins and 6 internal signals.

3.1.24 Digital to Analog Converter (DAC)

The Digital to Analog Converter (DAC) can convert a digital value to an analog output voltage. The DAC is fully differential rail-to-rail, with 12-bit resolution. It has two single-ended output buffers which can be combined into one differential output. The DAC may be used for a number of different applications such as sensor interfaces or sound output.

3.1.25 Operational Amplifier (OPAMP)

The EZR32LG330 features two Operational Amplifiers. The Operational Amplifier is a versatile general purpose amplifier with rail-to-rail differential input and rail-to-rail single-ended output. The input can be set to pin, DAC or OPAMP, whereas the output can be pin, OPAMP or ADC. The current is programmable and the OPAMP has various internal configurations such as unity gain, programmable gain using internal resistors, etc.

3.1.26 Low Energy Sensor Interface (LESENSE)

The Low Energy Sensor Interface (LESENSE™), is a highly configurable sensor interface with support for up to 16 individually configurable sensors. By controlling the analog comparators and DAC, LESENSE is capable of supporting a wide range of sensors and measurement schemes, and can for instance measure LC sensors, resistive sensors and capacitive sensors. LESENSE also includes a programmable FSM which enables simple processing of measurement results without CPU intervention. LESENSE is available in energy mode EM2, in addition to EM0 and EM1, making it ideal for sensor monitoring in applications with a strict energy budget.

3.1.27 Backup Power Domain

The backup power domain is a separate power domain containing a Backup Real Time Counter, BURTC, and a set of retention registers, available in all energy modes. This power domain can be configured to automatically change power source to a backup battery when the main power drains out. The backup power domain enables the EZR32LG330 to keep track of time and retain data, even if the main power source should drain out.

3.1.28 Advanced Encryption Standard Accelerator (AES)

The Advanced Encryption Standard Accelerator (AES) performs AES encryption and decryption with 128-bit or 256-bit keys. Encrypting or decrypting one 128-bit data block takes 52 HFCORECLK cycles with 128-bit keys and 75 HFCORECLK cycles with 256-bit keys. The AES module is an AHB slave which enables efficient access to the data and key registers. All write accesses to the AES module must be 32-bit operations (i.e., 8- or 16-bit operations are not supported).

3.1.29 General Purpose Input/Output (GPIO)

In the EZR32LG330, there are 38 General Purpose Input/Output (GPIO) pins, which are divided into ports with up to 16 pins each. These pins can individually be configured as either an output or input. More advanced configurations like open-drain, filtering and drive strength can also be configured individually for the pins. The GPIO pins can also be overridden by peripheral pin connections, like Timer PWM outputs or USART communication, which can be routed to several locations on the device. The GPIO supports up to 16 asynchronous external pin interrupts, which enables interrupts from any pin on the device. Also, the input value of a pin can be routed through the Peripheral Reflex System to other peripherals.

3.1.30 EZRadio® and EZRadioPro® Transceivers

The EZR32LG family of devices is built using high-performance, low-current EZRadio and EZRadioPro RF transceivers covering the sub-GHz frequency bands from 142 to 1050 MHz. These devices offer outstanding sensitivity of up to -133 dBm (using EZRadioPro) while achieving extremely low active and standby current consumption. The EZR32LG devices using the EZRadioPro transceiver offer frequency coverage in all major bands and include optimal phase noise, blocking, and selectivity performance for narrow band and licensed band applications, such as FCC Part 90 and 169 MHz wireless Mbus. The 69 dB adjacent channel selectivity with 12.5 kHz channel spacing ensures robust receive operation in harsh RF conditions, which is particularly important for narrow band operation. The active mode TX current consumption of 18 mA at +10 dBm and RX current of 10 mA coupled with extremely low standby current and fast wake times is optimized for extended battery life in the most demanding applications. The EZR32LG devices can achieve up to +27 dBm output power with built-in ramping control of a low-cost external FET. The devices can meet worldwide regulatory standards: FCC, ETSI, and ARIB. All devices using the EZRadioPRO transceiver are designed to be compliant with 802.15.4g and WMbus smart metering standards. The devices are highly flexible and can be programmed and configured via Simplicity Studio, available at www.silabs.com.

Communications between the radio and MCU are done over USART, PRS and IRQ, which requires the pins to be configured in the following way:

Table 3.1. Radio MCU Communication Configuration

| EZR32LG Pin | Radio Assignment | EZR32LG Function Assignment |
|-------------|------------------|---|
| PE8 | SDN | GPIO Output |
| PE9 | \bar{n} SEL | Bit-Banged SPI.CS (GPIO Output) |
| PE10 | SDI | US0_TX #0 |

3.1.30.1 EZRadio® and EZRadioPRO® Transceivers GPIO Configuration

The EZRadio and EZRadioPRO Transceivers have four General Purpose Digital I/O pins. These GPIOs may be configured to perform various radio-specific functions, including Clock Output, FIFO Status, POR, Wake-up Timer, TRSW, AntDiversity control, etc.

Two of the radio GPIO pins are directly connected to pins on the package (GPIO2 and GPIO3). However, the remaining two radio GPIO pins (GPIO0 and GPIO1) connect internally on the EZR32LG to the pins shown in [3.1.30 EZRadio® and EZRadioPro® Transceivers](#). These radio GPIOs may be routed to external package pins using the EZR32LG's peripheral reflex system (PRS). Note that the maximum frequency of the GPIO pins routed through PRS pins may be limited to ~10 MHz.

Below is some example code illustrating how to configure the EZR32LG PRS system to output the radio GPIO0/GPIO1 functions to EZR32LG pins PA0 / PA1, respectively. Note that the radio GPIO0/GPIO1 functions could also be connected to EZR32LG pins PF3/ PF4.

```

4. Electrical Specifications

4.1 Test Conditions

4.1.1 Typical Values

The typical data are based on $T_{AMB} = 25^{\circ}\text{C}$ and $V_{DD} = 3.0\text{ V}$, as defined in [Table 4.3 General Operating Conditions on page 16](#), by simulation and/or technology characterisation unless otherwise specified.

4.1.2 Minimum and Maximum Values

The minimum and maximum values represent the worst conditions of ambient temperature, supply voltage and frequencies, as defined in [Table 4.3 General Operating Conditions on page 16](#), by simulation and/or technology characterisation unless otherwise specified.

4.2 Absolute Maximum Ratings

The absolute maximum ratings are stress ratings, and functional operation under such conditions are not guaranteed. Stress beyond the limits specified in the table below may affect the device reliability or cause permanent damage to the device. Functional operating conditions are given in [Table 4.3 General Operating Conditions on page 16](#).

Table 4.1. Absolute Maximum Ratings

| Parameter | Symbol | Test Condition | Min | Typ | Max | Unit |
|-------------------------------|-------------|-------------------------------------|------|-----|------------------|--------------------|
| Storage temperature range | T_{STG} | | -55 | — | 150 ¹ | $^{\circ}\text{C}$ |
| Maximum soldering temperature | T_S | Latest IPC/JEDEC J-STD-020 Standard | — | — | 260 | $^{\circ}\text{C}$ |
| External main supply voltage | V_{DDMAX} | | 0 | — | 3.8 | V |
| Voltage on any I/O pin | V_{IOPIN} | | -0.3 | — | $V_{DD}+0.3$ | V |

Note:

1. Based on programmed devices tested for 10000 hours at 150 $^{\circ}\text{C}$. Storage temperature affects retention of preprogrammed calibration values stored in flash. Refer to the Flash section in the Electrical Characteristics for information on flash data retention for different temperatures.

4.3 Thermal Characteristics

Table 4.2. Thermal Conditions

| Parameter | Symbol | Test Condition | Min | Typ | Max | Unit |
|---------------------------------------|-----------|------------------------------|-----|-----|-------------------|------|
| Ambient temperature range | T_{AMB} | | -40 | — | 85 | °C |
| Junction temperature value | T_J | | — | — | 105 ¹ | °C |
| Thermal impedance junction to ambient | TI_{JA} | +13/+16 dBm on 2-layer board | — | — | 61.8 | °C/W |
| | | +20 dBm on 4-layer board | — | — | 20.7 ² | °C/W |
| Storage temperature range | T_{STG} | | -55 | — | 150 | °C |

Note:

1. Values are based on simulations run on 2-layer and 4-layer PCBs at 0m/s airflow.
2. Based on programmed devices tested for 10000 hours at 150 °C. Storage temperature affects retention of preprogrammed calibration values stored in flash. Refer to the Flash section in the Electrical Characteristics for information on flash data retention for different temperatures.

Note:

1. The TUNING field in the CMU_HFRCOCTRL register may be used to adjust the HFRCO frequency. There is enough adjustment range to ensure that the frequency bands above 7 MHz will always have some overlap across supply voltage and temperature. By using a stable frequency reference such as the LFXO or HFXO, a firmware calibration routine can vary the TUNING bits and the frequency band to maintain the HFRCO frequency at any arbitrary value between 7 MHz and 28 MHz across operating conditions.

Note:

1. Includes required contribution from the voltage reference.
2. On the average every ADC will have one missing code, most likely to appear around 2048 +/- n*512 where n can be a value in the set {-3, -2, -1, 1, 2, 3}. There will be no missing code around 2048, and in spite of the missing code the ADC will be monotonic at all times so that a response to a slowly increasing input will always be a slowly increasing output. Around the one code that is missing, the neighbor codes will look wider in the DNL plot. The spectra will show spurs on the level of -78dBc for a full-scale input for chips that have the missing code issue.
3. Typical numbers given by $\text{abs}(\text{Mean}) / (85 - 25)$.
4. Max number given by $(\text{abs}(\text{Mean}) + 3 \times \text{stddev}) / (85 - 25)$.

The integral non-linearity (INL) and differential non-linearity (DNL) parameters are explained in the following figures.

4.17.3 EZRadioPRO (R6x) Receiver AC Electrical Characteristics

For PER tests, 48 preamble symbols, 4 byte sync word, 10 byte payload and CRC-32 was used.

Measured over 50000 bits using PN9 data sequence and data and clock on GPIOs. Sensitivity is expected to be better if reading data from packet handler FIFO especially at higher data rates.

1. When in HFXO mode sensitivity will degrade at multiples of HFXO crystal frequency. Values in data sheet do not include spurious channel values.

4.17.4 EZRadioPRO (R6x) Transmitter AC Electrical Characteristics

The maximum data rate is dependent on the XTAL frequency and is calculated as per the formula: Maximum Symbol Rate = $F_{xtal}/60$, where F_{xtal} is the XTAL frequency (typically 30 MHz).

Default API setting for modulation deviation resolution is double the typical value specified.

Output power is dependent on matching components and board layout.

4.17.9 EZRadio (R55) Transmitter AC Electrical Characteristics

The maximum data rate is dependent on the XTAL frequency and is calculated as per the formula: Maximum Symbol Rate = $F_{xtal}/60$, where F_{xtal} is the XTAL frequency (typically 30 MHz).

Conducted measurements based on RF evaluation board. Output power and emissions specifications are dependent on transmit frequency, matching components, and board layout.

5.3 Alternate Functionality Pinout

A wide selection of alternate functionality is available for multiplexing to various pins. This is shown in the table. The table shows the name of the alternate functionality in the first column, followed by columns showing the possible LOCATION bitfield settings.

Note: Some functionality, such as analog interfaces, do not have alternate settings or a LOCATION bitfield. In these cases, the pinout is shown in the column corresponding to the LOCATION 0.

5.4 GPIO Pinout Overview

The specific GPIO pins available in EZR32LG330 are shown in the GPIO pinout table. Each GPIO port is organized as 16-bit ports indicated by letters A through F, and the individual pin on this port is indicated by a number from 15 down to 0.

Table 5.3. GPIO Pinout

Figure 5.3. QFN64

Note:

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing per ANSI Y14.5M-1994.
3. This drawing conforms to JEDEC outline MO-220 except for custom features D2, E2, L, Z, and Y which are toleranced per supplier designation.
4. Recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

6. PCB Layout and Soldering

6.1 Recommended PCB Layout

Figure 6.1. PCB Land Pattern

Table 6.1. PCB Land Pattern Dimensions (Dimensions in mm)

| Symbol | Dimension (mm) |
|--------|----------------|
| S1 | 7.93 |
| S | 7.93 |
| L1 | 7.00 |
| W1 | 7.00 |
| e | 0.50 |
| W | 0.26 |
| L | 0.84 |

| Symbol | Dimension (mm) |
|---|----------------|
| Note: | |
| General | |
| 1. All dimensions shown are in millimeters (mm) unless otherwise noted. | |
| 2. This Land Pattern Design is based on the IPC-7351 guidelines. | |
| Solder Mask Design | |
| 1. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 µm minimum, all the way around the pad. | |
| Stencil Design | |
| 1. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release. | |
| 2. The stencil thickness should be 0.125 mm (5 mils). | |
| 3. The ratio of stencil aperture to land pad size should be 1:1 for all perimeter pads. | |
| 4. A 4x4 array of 1.45 mm square openings on a 1.25 mm pitch should be used for the center ground pad. | |
| Card Assembly | |
| 1. A No-Clean, Type-3 solder paste is recommended. | |
| 2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components. | |

6.2 Soldering Information

The latest IPC/JEDEC J-STD-020 recommendations for Pb-Free reflow soldering should be followed.

7. Top Marking

The top marking is illustrated and explained below.

8. Revision History

8.1 Revision History

Revision 2.0

November, 2019

- Updated [Ordering Information](#) for the release of revision C devices.
- Removed content documented in RFI database:
 - Environmental Table from the Electrical Specifications chapter.
 - Moisture Sensitivity Level in the Soldering Information section.
- Updated operational amplifier (OPAMP) R_{LOAD} specification, changed value from a minimum to a typical, and added a note explaining how the parameter is derived.
- Operational amplifier pinout figure updated to show device-specific terminal availability.
- In [GPIO](#) Electrical Specifications:
 - Reduced maximum input leakage current (I_{IOLEAK}).
 - Added upper limit for pulse width of pulses to be removed by the glitch suppression filter ($t_{IOGLITCH}$).
- In [LFXO](#) Electrical Specifications:
 - Replaced “energyAware Designer” with “Configurator tool”.
 - Added (min, max) specifications for Supported nominal crystal Frequency oscillation (f_{LFXO}).
 - Updated typical specification for start-up time (t_{LFXO}).
- In [Analog Digital Converter \(ADC\)](#) Electrical Specifications:
 - Updated test conditions, updated specifications, and added footnote for average active current (I_{ADC}).
 - Removed ADC internal voltage reference (I_{ADREF}).
 - Updated ADC input ON resistance (R_{ADCIN}).
 - Added input bias current ($I_{ADCBIASIN}$).
 - Added input offset current ($I_{ADCOFFSETIN}$).
 - Added test condition information for Acquisition time (t_{ADCACQ}), Startup time of reference generator and ADC core ($t_{ADCSTART}$), Differential non-linearity (DNL_{ADC}) and Integral non-linearity (INL_{ADC}).
 - Updated missing codes parameter (MC_{ADC}).
 - Added VREF output voltage (V_{REF}), VREF voltage drift (V_{REF_VDRIFT}), VREF temperature drift (V_{REF_TDRIFT}), VREF current consumption (I_{VREF}) and ADC and DAC VREF matching (V_{REF_MATCH}).
- In [Operational Amplifier \(OPAMP\)](#) Electrical Specifications:
 - Updated the load resistance (R_{LOAD}).
- In [Radio](#) Electrical Specifications:
 - Added R69 content.
 - Added footnote in EZRadioPro Receiver AC Electrical Characteristics tables.
- Updated [PCB Land Pattern Dimensions](#) table to fix typographical error.
- New formatting throughout.
- Updated P₃P₄P₅ in Line 2 Marking from "320" to "330" in [Top Marking](#).

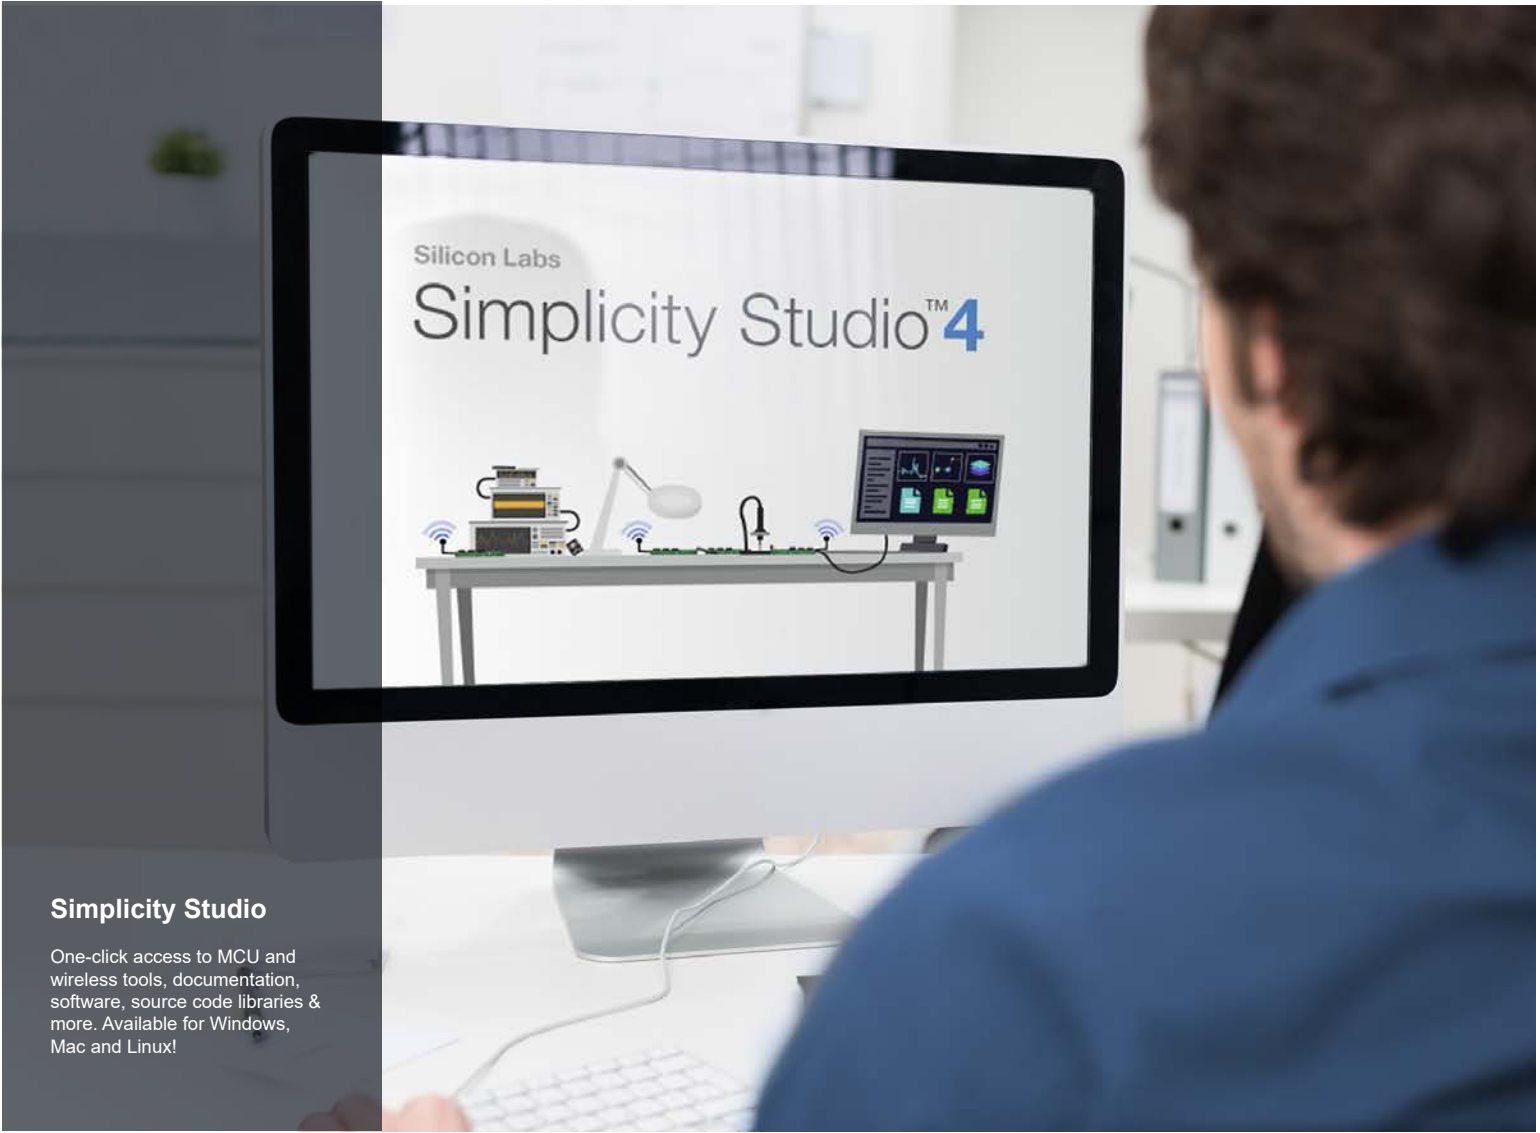

Revision 1.1

- Updated OPNs in Ordering section.
- USART0 in Configuration Summary table changed to USARTRF0.
- Sleep current corrected from 40 nA to 20 nA.
- GPIO number corrected from 41 to 38.
- Number of operational amplifiers corrected from 3 to 2.
- Added "EZRadio and EZRadioPRO Transceivers GPIO Configuration" section.
- Updated Table 5.1 Device Pinout: Revised Pin 10, Pin 11, Pin 61, and Pin 62
- Updated Table 5.2 Alternate Functionality Overview: Removed GPIO0 and GPIO1
- Revised Top Marking Table: Corrected Line 2 Marking row
- Revised Table 3.2 Configuration Table: Added USB
- Updated Section 5.6 (QFN64 Package) and Table 5.4 (QFN64 package dimensions)*
- Updated Section 6.1—PCB Land Pattern Dimensions*

* This revision reflects the actual package dimension that is in production and affects the documentation only. There is no change to the package/product.
