## Operating Temperature Ranges:

|                                         |                 |
|-----------------------------------------|-----------------|
| M Series .....                          | -55°C to +125°C |
| E Series .....                          | -40°C to +85°C  |
| C Series .....                          | -0°C to +70°C   |
| Storage Temperature Range .....         | -55°C to +150°C |
| Lead Temperature (soldering, 10s) ..... | +300°C          |
| Soldering Temperature (reflow)          |                 |
| Lead(Pb)-Free Packages .....            | +260°C          |
| Packages Containing Lead.....           | +240°C          |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Note 1:** Long-term offset voltage stability will be degraded if large input differential voltages are applied for long periods of time.

**Note 2:** The outputs may be shorted to ground or to either supply for  $V_{SUPP} \leq 10V$ . Care must be taken to insure that the dissipation rating is not exceeded.

**Electrical Characteristics (Single/Dual)**

( $V_{SUPP} = \pm 1.0V$ ,  $I_Q = 10\mu A$ ,  $T_A = +25^\circ\text{C}$ , unless otherwise noted.)

**Note:** X above is replaced by: 1, 2.

## Pin Configurations

**Absolute Maximum Ratings (Triple/Quad)**

Total Supply Voltage ( $V_+$  to  $V_-$ ) .....+18V  
 Input Voltage .....( $V_+ + 0.3V$ ) to ( $V_- - 0.3V$ )  
 Differential Input Voltage (Note 5)..... $\pm[(V_+ + 0.3V) - (V_- - 0.3V)]$   
 Duration of Output Short Circuit (Note 6) ..... Unlimited  
 Continuous Power Dissipation ( $T_A = +25^\circ\text{C}$ )  
     TO-99 Metal Can (derate 2mW/ $^\circ\text{C}$  above  $+25^\circ\text{C}$ ).....250mW  
     8-Pin Minidip (derate 2mW/ $^\circ\text{C}$  above  $+25^\circ\text{C}$ ) .....250mW  
     14-Pin Plastic (derate 3mW/ $^\circ\text{C}$  above  $+25^\circ\text{C}$ ) .....375mW  
     14-Pin CERDIP (derate 4mW/ $^\circ\text{C}$  above  $+25^\circ\text{C}$ ) .....500mW

16-Pin Plastic (derate 3mW/ $^\circ\text{C}$  above  $+25^\circ\text{C}$ ) .....375mW  
 16-Pin CERDIP (derate 4mW/ $^\circ\text{C}$  above  $+25^\circ\text{C}$ ) .....500mW  
 Operating Temperature Ranges:  
 M Series .....  $-55^\circ\text{C}$  to  $+125^\circ\text{C}$   
 E Series .....  $-40^\circ\text{C}$  to  $+85^\circ\text{C}$   
 C Series .....  $-0^\circ\text{C}$  to  $+70^\circ\text{C}$   
 Storage Temperature Range .....  $-55^\circ\text{C}$  to  $+150^\circ\text{C}$   
 Lead Temperature (soldering, 10s) .....  $+300^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Note 5:** Long-term offset voltage stability will be degraded if large input differential voltages are applied for long periods of time.

**Note 6:** The outputs may be shorted to ground or to either supply for  $V_{\text{SUPP}} \leq 10V$ . Care must be taken to insure that the dissipation rating is not exceeded.

**Electrical Characteristics (Triple/Quad)**

( $V_{\text{SUPP}} = \pm 1.0V$ ,  $I_Q = 10\mu\text{A}$ ,  $T_A = +25^\circ\text{C}$ , unless otherwise noted.) (Specifications apply to ICL7631/7632/7642 only.)

## Detailed Description

### Quiescent Current Selection

The voltage input to the  $I_Q$  pin of the single and triple amplifiers selects a quiescent current ( $I_Q$ ) of 10 $\mu$ A, 100 $\mu$ A, or 1000 $\mu$ A. The dual and quad amplifiers have fixed quiescent current ( $I_Q$ ) settings. Unity-gain bandwidth and slew-rate increase with increasing quiescent current, as does output sink current capability. The output source current capability is independent of quiescent current.

The lowest  $I_Q$  setting that results in sufficient bandwidth and slew rate should be selected for each specific application.

The  $I_Q$  pin of the single and triple amplifiers controls the quiescent current as follows:

|                        |                                           |
|------------------------|-------------------------------------------|
| $I_Q = 10\mu\text{A}$  | $I_Q$ pin to V+                           |
| $I_Q = 100\mu\text{A}$ | $I_Q$ pin between V- + 0.8V and V+ - 0.8V |
| $I_Q = 1\text{mA}$     | $I_Q$ pin to V                            |

### Input Offset Nulling

The input offset can be nulled by connecting a 25k $\Omega$  pot between the OFFSET terminals with the wiper connected to V+. At quiescent currents of 1mA and 100 $\mu$ A, the nulling range provided is adequate for all  $V_{OS}$  selections. However, with higher values of  $V_{OS}$ , and an  $I_Q$  of 10 $\mu$ A, nulling may not be possible.

### Frequency Compensation

All of the ICL7611 and ICL7621 series except the ICL7614 are internally compensated for unity-gain operation. The ICL7614 is externally compensated by a capacitor connected between COMP and OUT pins, with 39pF being greater than unity. The compensation capacitor value may be reduced to increase the bandwidth and slew rate. The ICL7132 is not compensated and does not have frequency compensation pins. Use only at gains 20 at  $I_Q$  of 1mA; at gains > 10 at  $I_Q$  of 100 $\mu$ A; at gain > 5 at  $I_Q$  of 10 $\mu$ A.

### Output Loading Considerations

Approximately 70% of the amplifier's quiescent current flows in the output stage. The output swing can approach the supply rails for output loads of 1M $\Omega$ , 100k $\Omega$ , and 10k $\Omega$ , using the output stage in a highly linear Class A mode. Crossover distortion is avoided and the voltage gain is maximized in this mode. The output

stage, however, can also be operated in Class AB, which supplies higher output currents (see the *Typical Operating Characteristics*). The voltage gain decreases and the output transfer characteristic is non-linear during the transition from Class A to Class B operation.

The output stage, with a gain that is directly proportional to load impedance, approximates a transconductance amplifier. Approximately the same open-loop gains are obtained at each of the  $I_Q$  settings if corresponding loads of 10k $\Omega$ , 100k $\Omega$ , and 1M $\Omega$  are used.

The maximum output source current is higher than the maximum sink current, and is independent of  $I_Q$ .

Like most amplifiers, there are output loads for which the amplifier stability is not guaranteed. In particular, avoid capacitive loads greater than 100pF; and while on the 1mA  $I_Q$  setting, avoid loads less than 5k $\Omega$ . Since the output stage is a transconductance output, very large (>10 $\mu$ F) capacitive loads will create a dominant pole and the output will be stable, even with loads that are less than 5k $\Omega$ .

### Extended Common-Mode Voltage Range (ICL7612/ICL7616)

A common-mode voltage range that includes both V+ and V- is often desirable, especially in single-supply operation. The ICL7612/ICL7616 extended common-mode range op amps are designed specifically to meet this need. The ICL7612 input common-mode voltage range (CMVR) extends beyond both power-supply rails when operated with at least 3V total supply and an  $I_Q$  of 10 $\mu$ A or 100 $\mu$ A. The ICL7616 CMVR includes the negative supply voltage (or ground when operated with a single supply) at an  $I_Q$  of 10 $\mu$ A or 100 $\mu$ A.

### PC Board Layout

Careful PC board layout techniques must be used to take full advantage of the very low bias current of the ICL7611 family. The inputs should be encircled with a low-impedance trace, or guard, that is at the same potential as the inputs. In an inverting amplifier, this is normally ground; in a unity-gain buffer connect the guard to the output. A convenient way of guarding the 8-pin TO-99 version of the ICL7611 is to use a 10-pin circle, with the two extra pads on either side of the input pins to provide space for a guard ring (see Figure 8). Assembled boards should be carefully cleaned, and if a high humidity environment is expected, conformally coated.

### Single-Supply Operation

The ICL7611 family will operate from a single 2V to 16V power supply. The common-mode voltage range of the standard amplifier types when operated from a single supply is 1.0V to ( $V+ - 0.6V$ ) at  $10\mu A$   $I_Q$ . At  $100\mu A$   $I_Q$ , the CMVR is 1.0V to ( $V+ - 0.8V$ ), and at 1mA  $I_Q$ , the CMVR is 1.3V to ( $V+ - 1.3V$ ). If this CMVR range is insufficient, use the ICL7612, whose CMVR includes both ground and  $V+$ , or the ICL7616, whose CMVR includes ground.

A convenient way to generate a psuedo-ground at  $V+/2$  is to use one op amp of a quad to buffer a  $V+/2$  voltage from a high-impedance resistive divider.

Figure 1. Instrumentation Amplifier—Adjust  $R3$  to improve CMRR. The offset of all three amplifiers is nulled by the offset adjustment of  $A2$ .

### Low-Voltage Operation

Operation at  $V_{SUPP} = \pm 1.0V$  is only guaranteed at  $I_Q = 10\mu A$ . Output swings to within a few millivolts of the supply rails are achievable for  $R_L (> \text{or} =) 1M\Omega$ . Guaranteed input CMVR is  $\pm 0.6V$  minimum and typically  $+0.9V$  to  $-0.7V$  at  $V_{SUPP} = \pm 1.0V$ . For applications where greater common-mode range is desirable, see the description of ICL7612 and ICL7616 above.

### Applications Information

Note that in no case is  $I_Q$  shown. The value of  $I_Q$  must be chosen by the designer with regard to frequency response and power dissipation.

Figure 2. Simple Follower—By using the ICL7612 in these applications, the circuits will follow rail-to-rail inputs

Figure 3. Level Detector—By using the ICL7612 in these applications, the circuits will follow rail-to-rail inputs.

Figure 4. Photocurrent Integrator—Low-leakage currents allow integration times up to several hours.

Figure 5. Precise Triangle/Square Wave Generator—The frequency and duty cycle are virtually independent of power supply.

Figure 6. Averaging AC to DC Converter—Recommended for Maxim's ICL7106/ICL7107/ICL7109 A/D Converters.

Figure 7. Burn-In and Life Test Circuit

Figure 8. Input Guard for TO-99

Figure 9. Low Droop Rate Sample and Hold—S2 improves accuracy and acquisition time by including the voltage drop across S1 inside the feedback loop. R1 closes the feedback loop of A1 during the hold phase. The droop rate is  $[I_{BIAS(AZ)} + I_{LEAK(S1)} + I_{LEAK(S2)}]/C_{HOLD}$ .

Figure 10. Long-Time Constant Integrator—With  $R_{IN} = 1011\Omega$ , the time constant of this integrator is 100,000s. Since the input voltage is converted to a current by  $R_{IN}$ , the input voltage can far exceed the power-supply range.

Figure 11. Pico Ammeter—The response time of this circuit is  $R_{FB} \times C_{FB}$ , where  $C_{FB}$  is the stray capacitance between the output and the inverting terminal of the amplifier.

Figure 12. 60Hz Twin "T" Notch Filter—The low 1pA bias current of the ICL7611 allows use of small 540pF and 270pF capacitors, even with a notch frequency of 60Hz. The 60Hz rejection is approximately 40dB.
