Test Method：

The specified electro-optical characteristics is satisfied under the following Conditions at the controllable distance.

①Measurement place

A place that is nothing of extreme light reflected in the room.

②External light

Project the light of ordinary white fluorescent lamps which are not high Frequency lamps and must be less then 10 Lux at the module surface. (Ee≦10Lux)

③Standard transmitter

A transmitter whose output is so adjusted as to **Vo=400mVp-p** and the output Wave form shown in Fig.-1.According to the measurement method shown in Fig.-2 the standard transmitter is specified.

However , the infrared photodiode to be used for the transmitter should be λp=940nm,Δλ=50nm. Also, photodiode is used of PD438B(Vr=5V).

④Measuring system

According to the measuring system shown in Fig.-3

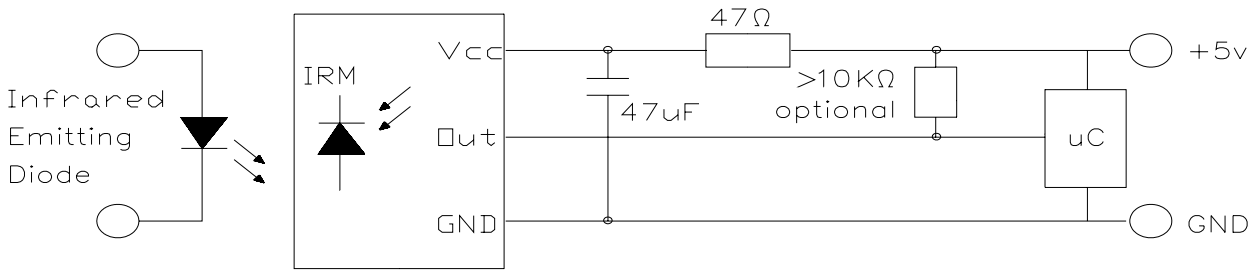
Application Circuit：



RC Filter should be connected closely between Vcc pin and GND pin.

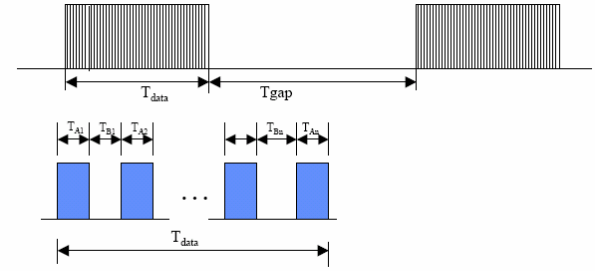
The Notice of Application:

Transmission o remote control signal consist of four parts: Encode Part, IR Transmitter Source, IRM device, Decode Part

1. When IRM-26xxA code select frequency, it need to well understand the center system of encode part.
2. Strong or weak light of IR Transmitter can affect distance of transmission.
3. When using IRM-26xxA device, it requires the composition of code pattern to reach the demand as follows:

   Minimum Burst Length tburst (number of pulses per burst) : 10 cycles
   Minimum data pause time:

   Remocon Tx code with Full frame Repeat



$$T_{actual,data} = T_{data} - \sum_{n}(T_{Bn} - 150\mu s)$$

$$T_{actual,gap} = T_{gap} - \sum_{n}(T_{Bn} - 150\mu s)$$

$$T_{actual,gap} \geq 2.0 * T_{actual,data}$$

   Remocon TX code with Repeat key

   Remocon TX repeat Code with minimum burst length

$$T_{gap} \geq 2.0 * (T_r + 150\mu s)$$

4. It needs to ensure the translation range of decode part if it is applied to the pulse-width range.

If the above items hardly assure of its application, it'll cause NG(no good) message from the edge of signal.
