Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: Typical parameters are defined as the 60% yield of parameter distributions of individual amplifiers, i.e., out of 100 LT2079s (or 100 LT2078s) typically 240 op amps (or 120) will be better than the indicated specification.

Note 3: This parameter is tested on a sample basis only. All noise parameters are tested with $V_S = \pm 2.5\text{V}$, $V_O = 0\text{V}$.

Note 4: This parameter is guaranteed by design and is not tested.

Note 5: Power supply rejection ratio is measured at the minimum supply voltage. The op amps actually work at 1.8V supply but with a typical offset skew of $-300\mu\text{V}$.

Note 6: This parameter is not 100% tested.

Note 7: The LT2078C/LT2079C are designed, characterized and expected to meet the industrial temperature limits, but are not tested at -40°C and 85°C . I-grade parts are guaranteed.

APPLICATIONS INFORMATION

The LT2078/LT2079 devices are fully specified with $V^+ = 5V$, $V^- = 0V$, $V_{CM} = 0.1V$. This set of operating conditions appears to be the most representative for battery powered micropower circuits. Offset voltage is internally trimmed to a minimum value at these supply voltages. When 9V or 3V batteries or $\pm 2.5V$ dual supplies are used, bias and offset current changes will be minimal. Offset voltage changes will be just a few microvolts as given by the PSRR and CMRR specifications. For example, if $PSRR = 114dB (=2\mu V/V)$, at 9V the offset voltage change will be $8\mu V$. Similarly, $V_S = \pm 2.5V$, $V_{CM} = 0V$ is equivalent to a common mode voltage change of $2.4V$ or a V_{OS} change of $7\mu V$ if $CMRR = 110dB (3\mu V/V)$.

A full set of specifications is also provided at $\pm 15V$ supply voltages for comparison with other devices and for completeness.

Single Supply Operation

The LT2078/LT2079 is quite tolerant of power supply bypassing. In some applications requiring faster settling time the positive supply pin of the LT2078/LT2079 should be bypassed with a small capacitor (about $0.1\mu F$). The same is true for the negative supply pin when using split supplies.

The LT2078/LT2079 are fully specified for single supply operation, i.e., when the negative supply is $0V$. Input common mode range goes below ground and the output swings within a few millivolts of ground while sinking current. All competing micropower op amps either cannot swing to within $600mV$ of ground (OP-20, OP-220, OP-420) or need a pull-down resistor connected to the output to swing to ground (OP-90, OP-290, OP-490, HA5141/42/44). This difference is critical because in many applications these competing devices cannot be operated as micropower op amps and swing to ground simultaneously.

Figure 1a. Gain 100 Amplifier

Figure 1b. Voltage Follower

As an example, consider the instrumentation amplifier shown on the front page. When the common mode signal is low and the output is high, amplifier A has to sink current. When the common mode signal is high and the output low, amplifier B has to sink current. The competing devices require a $12k$ pull-down resistor at the output of amplifier A and a $15k$ at the output of B to handle the specified signals. (The LT2078 does not need pull-down resistors.) When the common mode input is high and the output is high these pull-down resistors draw $300\mu A$ ($150\mu A$ each), which is excessive for micropower applications.

The instrumentation amplifier is by no means the only application requiring current sinking capability. In seven of the nine single supply applications shown in this data sheet the op amps have to be able to sink current. In two of the applications the first amplifier has to sink only the $6nA$ input bias current of the second op amp. The competing devices, however, cannot even sink $6nA$ without a pull-down resistor

Since the output of the LT2078/LT2079 cannot go exactly to ground, but can only approach ground to within a few millivolts, care should be exercised to ensure that the output is not saturated. For example, a $1mV$ input signal will cause the amplifier to set up in its linear region in the gain 100 configuration shown in Figure 1, but is not enough to make the amplifier function properly in the voltage follower mode.

Single supply operation can also create difficulties at the input. The driving signal can fall below $0V$ — inadvertently or on a transient basis. If the input is more than a few hundred millivolts below ground, two distinct problems can occur on previous single supply designs, such as the LM124, LM158, OP-20, OP-21, OP-220, OP-221, OP-420 (1 and 2), OP-90/290/490 (2 only):

APPLICATIONS INFORMATION

1. When the input is more than a diode drop below ground, unlimited current will flow from the substrate (V^- terminal) to the input. This can destroy the unit. On the LT2078/LT2079, resistors in series with the input protect the devices even when the input is 5V below ground.
2. When the input is more than 400mV below ground (at 25°C), the input stage saturates and phase reversal occurs at the output. This can cause lockup in servo systems. Due to a unique phase reversal protection circuitry, the LT2078/LT2079 output does not reverse, as illustrated in Figure 2, even when the inputs are at $-1V$.

Distortion

There are two main contributors of distortion in op amps: distortion caused by nonlinear common mode rejection and output crossover distortion as the output transitions from sourcing to sinking current. The common mode

rejection of the LT2078/LT2079 is very good, typically 108dB. Therefore, as long as the input operates in the normal common mode range, there will be very little common mode induced distortion. If the op amp is operating inverting there is no common mode induced distortion. Crossover distortion will increase as the output load resistance decreases. For the lowest distortion the LT2078/LT2079 should be operated with the output always sourcing current, this is usually accomplished by putting a resistor from the output to V^- . In an inverting configuration with no load, the output will source and sink current through the feedback resistor. High value feedback resistors will reduce crossover distortion and maintain micropower operation.

Matching Specifications

In many applications the performance of a system depends on the matching between two op amps, rather than

LT2078/79 • F01c

Figure 2. Voltage Follower with Input Exceeding the Negative Common Mode Range ($V_S = 5V$, $0V$)

APPLICATIONS INFORMATION

the individual characteristics of the two devices, the two and three op amp instrumentation amplifier configurations shown in this data sheet are examples. Matching characteristics are not 100% tested on the LT2078/LT2079.

Some specifications are guaranteed by definition. For example, 70 μ V maximum offset voltage implies that mismatch cannot be more than 140 μ V. 95dB (= 17.5 μ V/V) CMRR means that worst-case CMRR match is 89dB (= 35 μ V/V). However, Table 1 can be used to estimate the

expected matching performance at $V_S = 5V, 0V$ between the two sides of the LT2078, and between amplifiers A and D, and between amplifiers B and C of the LT2079.

Comparator Applications

The single supply operation of the LT2078/LT2079 and its ability to swing close to ground while sinking current lends itself to use as a precision comparator with TTL compatible output.

Figure 3. Comparator Rise Response Time to 10mV, 5mV, 2mV Overdrives

Figure 4. Comparator Fall Response Time to 10mV, 5mV, 2mV Overdrives

TYPICAL APPLICATIONS

THE USEFULNESS OF DIFFERENCE AMPLIFIERS IS LIMITED BY THE FACT THAT THE INPUT RESISTANCE IS EQUAL TO THE SOURCE RESISTANCE. THE PICOAMPERE OFFSET CURRENT AND LOW CURRENT NOISE OF THE LT2078 ALLOWS THE USE OF 1M SOURCE RESISTORS WITHOUT DEGRADATION IN PERFORMANCE. IN ADDITION, WITH MEGOHM RESISTORS MICROPOWER OPERATION CAN BE MAINTAINED

TYPICAL APPLICATIONS

Picoampere Input Current, Triple Op Amp Instrumentation Amplifier with Bias Current Cancellation

85V, -100V Common Mode Range Instrumentation Amplifier ($A_V = 10$)

Half-Wave Rectifier

Absolute Value Circuit (Full-Wave Rectifier)

Programmable Gain Amplifier (Single Supply)

TYPICAL APPLICATIONS

Single Supply, Micropower, Second Order Lowpass Filter with 60Hz Notch

Micropower Multiplier/Divider

Micropower Dead Zone Generator

TYPICAL APPLICATIONS

Lead-Acid Low-Battery Detector with System Shutdown

PACKAGE DESCRIPTION

S8 Package 8-Lead Plastic Small Outline (Narrow .150 Inch) (Reference LTC DWG # 05-08-1610)

S08 0303

20789fa
