

LV8761V

Allowable Operating Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage range	VM		9 to 35	V
	V _{CC}		3 to 5.5	V
VREF input voltage	VREF		0 to V _{CC} -1.8	V
Logic input voltage	V _{IN}		0 to V _{CC}	V

Electrical Characteristics at Ta = 25°C, VM = 24V, V_{CC} = 5V, VREF = 1.5V

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
General						
Standby mode current drain 1	IMst	PS = "L"			1	μA
Standby mode current drain 2	I _{CCst}	PS = "L"			1	μA
Operating mode current drain 1	IM	PS = "H", IN1 = "H", with no load		1	1.3	mA
Operating mode current drain 2	I _{CC}	PS = "H", IN1 = "H", with no load		3	4	mA
VREG output voltage	VREG	I _O = -1mA	4.75	5	5.25	V
V _{CC} low-voltage cutoff voltage	V _{th} V _{CC}		2.5	2.7	2.9	V
Low-voltage hysteresis voltage	V _{th} HIS		120	150	180	mV
Thermal shutdown temperature	TSD	Design guarantee *	155	170	185	°C
Thermal hysteresis width	ΔTSD	Design guarantee *		40		°C
Output block						
Output on resistance	R _{on1}	I _O = 3A, sink side		0.2	0.25	Ω
	R _{on2}	I _O = -3A, source side		0.32	0.40	Ω
Output leakage current	I _{Oleak}	V _O = 35V			50	μA
Rising time	t _r	10% to 90%		200	500	ns
Falling time	t _f	90% to 10%		200	500	ns
Input output delay time	t _{pLH}	IN1 or IN2 to OUTA or OUTB (L → H)		550	700	ns
	t _{pHL}	IN1 or IN2 to OUTA or OUTB (H → L)		550	700	ns
Charge pump block						
Step-up voltage	V _{GH}	V _M = 24V	28.0	28.7	29.8	V
Rising time	t _{ONG}	V _G = 0.1μF		250	500	μs
Oscillation frequency	F _{cp}		115	140	165	kHz
Control system input block						
Logic pin input current 1	I _{INL}	V _{IN} = 0.8V adaptive pin : PS	5.6	8	10.4	μA
	I _{INH}	V _{IN} = 5V adaptive pin : PS	56	80	104	μA
Logic pin input current 2	I _{INL}	V _{IN} = 0.8V adaptive pin : IN1, IN2, EMM	5.6	8	10.4	μA
	I _{INH}	V _{IN} = 5V adaptive pin : IN1, IN2, EMM	35	50	65	μA
Logic pin input H-level voltage	V _{INH}	adaptive pin : PS, IN1, IN2, EMM	2.0			V
Logic pin input L-level voltage	V _{INL}	adaptive pin : PS, IN1, IN2, EMM			0.8	V
Current limiter block						
VREF input current	I _{REF}		-0.5			μA
Current limit comparator threshold voltage	V _{thlim}	VREF = 1.5V	0.285	0.3	0.315	V
Short-circuit protection block						
SCP pin charge current	I _{scp}	SCP = 0V	3.5	5	6.5	μA
Comparator threshold voltage	V _{thscp}		0.8	1	1.2	V
EMO output saturation voltage	V _{emo}	I _O = 500μA		0.3	0.4	V

LV8761V

Package Dimensions

unit : mm (typ)
3361

Pin Assignment

Substrate Specifications (Substrate recommended for operation of LV8761T)

Size : 90mm × 90mm × 1.6mm (two-layer substrate [2S0P])
 Material : Glass epoxy
 Copper wiring density : L1 = 95% / L2 = 95%

L1 : Copper wiring pattern diagram

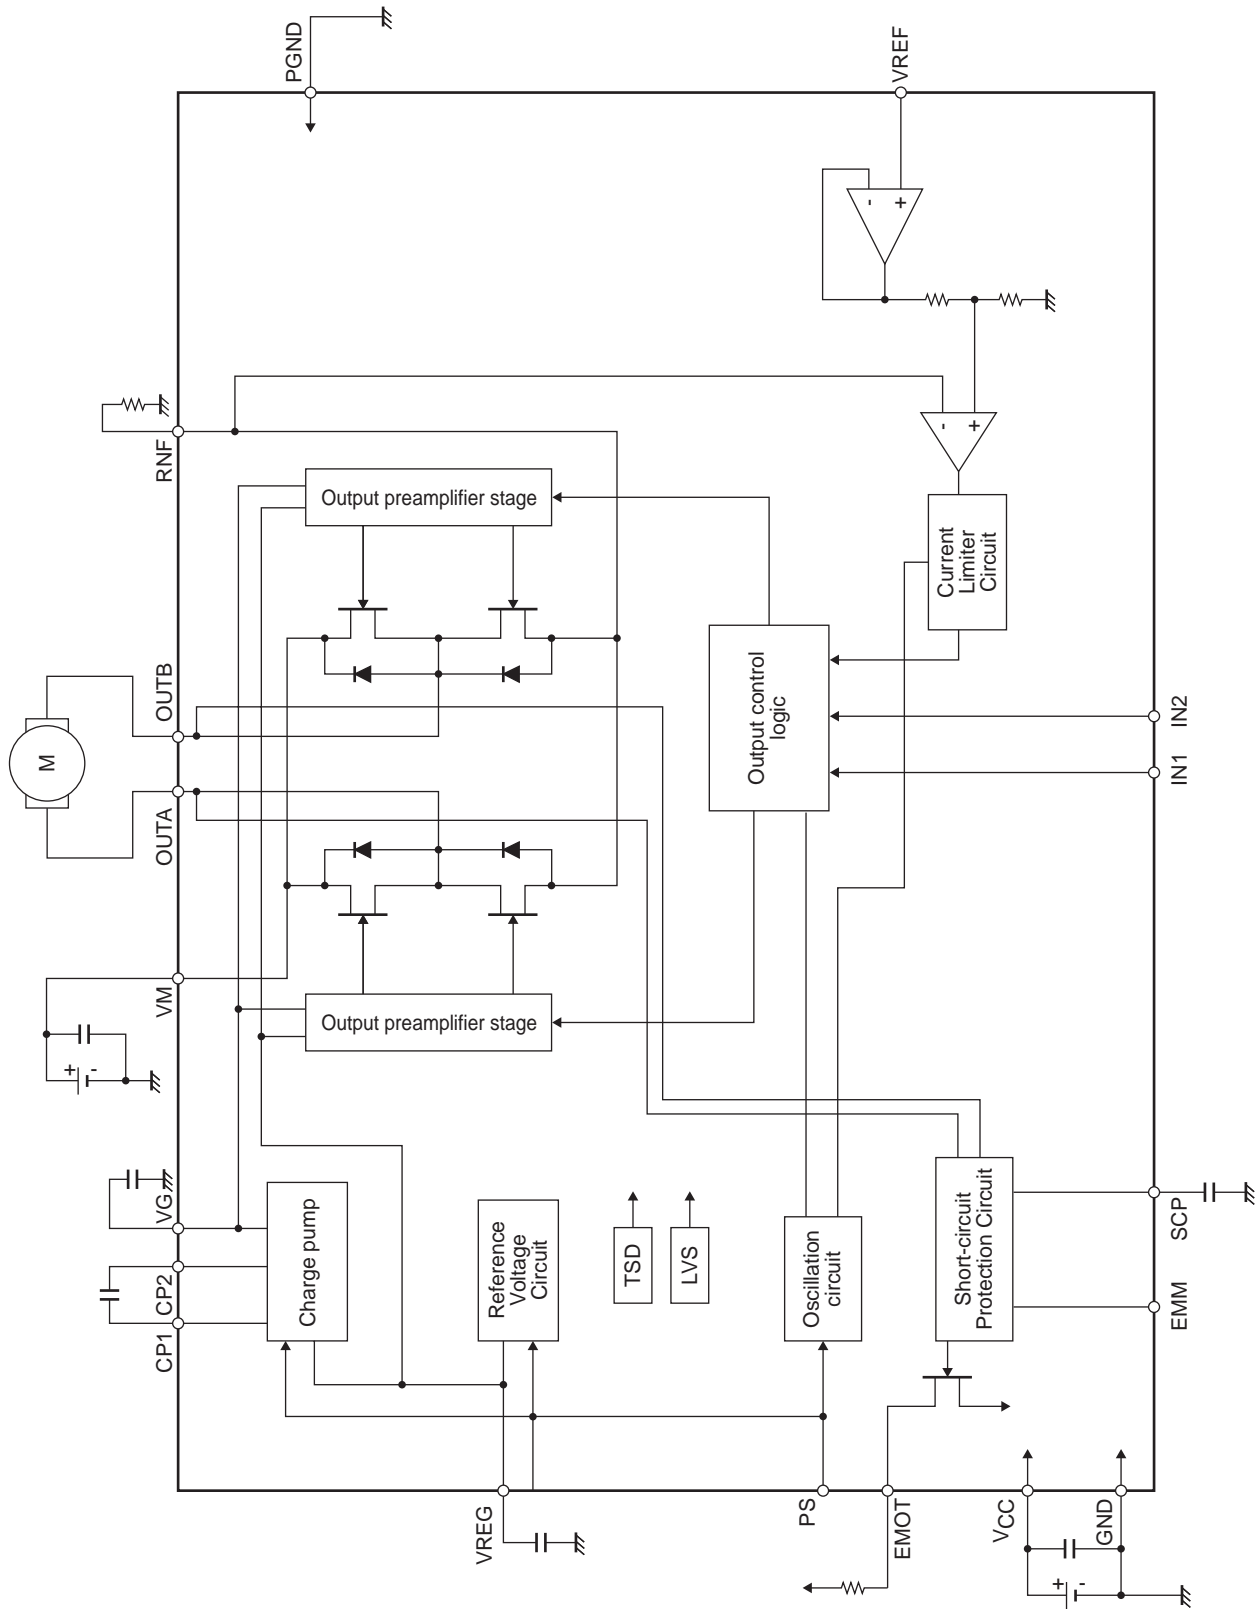

L2 : Copper wiring pattern diagram

Cautions

- 1) The data for the case with the Exposed Die-Pad substrate mounted shows the values when 90% or more of the Exposed Die-Pad is wet.
- 2) For the set design, employ the derating design with sufficient margin.
 Stresses to be derated include the voltage, current, junction temperature, power loss, and mechanical stresses such as vibration, impact, and tension.
 Accordingly, the design must ensure these stresses to be as low or small as possible.
 The guideline for ordinary derating is shown below :
 (1)Maximum value 80% or less for the voltage rating
 (2)Maximum value 80% or less for the current rating
 (3)Maximum value 80% or less for the temperature rating
- 3) After the set design, be sure to verify the design with the actual product.
 Confirm the solder joint state and verify also the reliability of solder joint for the Exposed Die-Pad, etc.
 Any void or deterioration, if observed in the solder joint of these parts, causes deteriorated thermal conduction, possibly resulting in thermal destruction of IC.

LV8761V

Pin Functions

Pin No.	Pin Name	Pin Function	Equivalent Circuit
29 30 36	IN1 IN2 EMM	Output control signal input pin 1. Output control signal input pin 2. Short-circuit protection circuit mode switching pin.	
17	PS	Power save signal input pin.	
34	VREF	Reference voltage input pin for output current limit setting.	
35	SCP	Short-circuit protection circuit, detection time setting capacitor connection pin.	
1	VCC	Power supply connection pin for control block.	

Continued on next page.

LV8761V

Continued from preceding page.

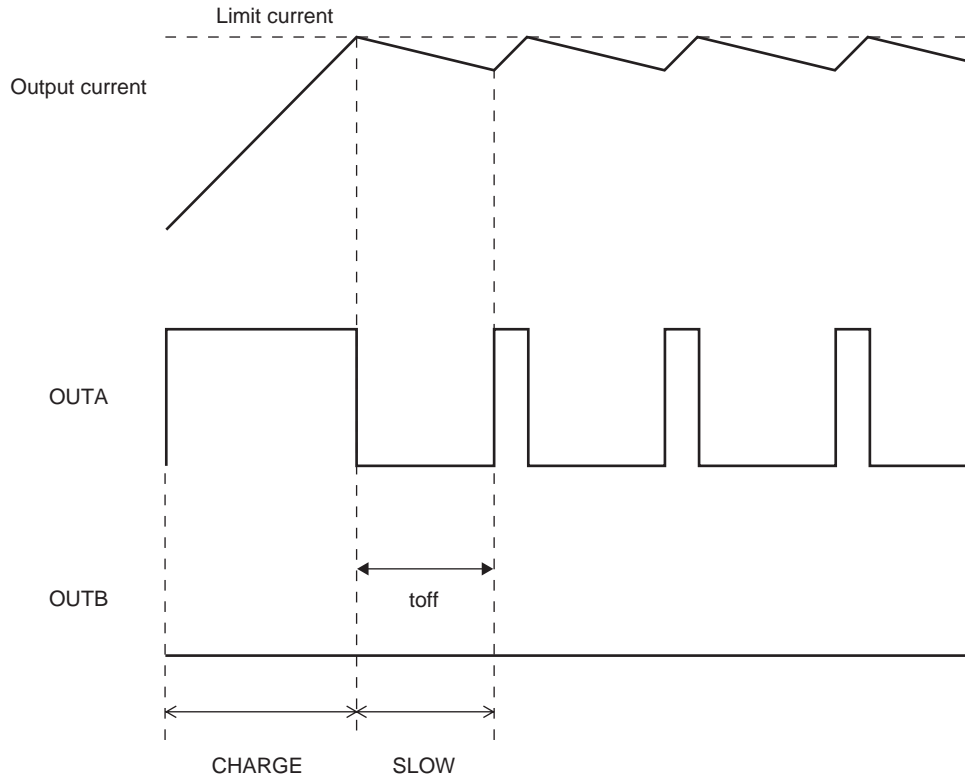

Pin No.	Pin Name	Pin Function	Equivalent Circuit
10, 11 12, 13 8, 9 6, 7 2	VM OUTA RNF OUTB PGND	Motor power-supply connection pin. OUTA output pin. Current sense resistor connection pin. OUTB output pin. Power ground.	
26 25 21	CP1 CP2 VG	Charge pump capacitor connection pin. Charge pump capacitor connection pin. Charge pump capacitor connection pin.	
27	REG5	Internal reference voltage output pin.	
19	EMOT	Unusual condition warning output pin.	
18, 23	GND	Ground.	

DC Motor Driver

1.DCM output control logic

Control Input			Output		Mode
PS	IN1	IN2	OUTA	OUTB	
L	*	*	OFF	OFF	Standby
H	L	L	OFF	OFF	Output OFF
H	H	L	H	L	CW (forward)
H	L	H	L	H	CCW (reverse)
H	H	H	L	L	Brake

2.Current limit control timing chart

Braking operation time in current limit mode can be set by connecting a capacitor between SCP and GND pins. This setting is the same as the time setting required to turn off the outputs when an output short-circuit occurs as explained in the section entitled "Output Short-circuit Protection Function." See "Output Short-circuit Protection Function," for the setting procedure.

3.Setting the current limit value

The current limit value of the DCM driver is determined by the VREF voltage and the resistance (RNF) connected across the RNF and GND pins using the following formula :

$$I_{\text{limit}} [\text{A}] = (\text{VREF} [\text{V}] / 5) / \text{RNF} [\Omega]$$

Assuming VREF = 1.5V, RNF = 0.2Ω, the current limit is :

$$I_{\text{limit}} = 1.5\text{V} / 5 / 0.2\Omega = 1.5\text{A}$$

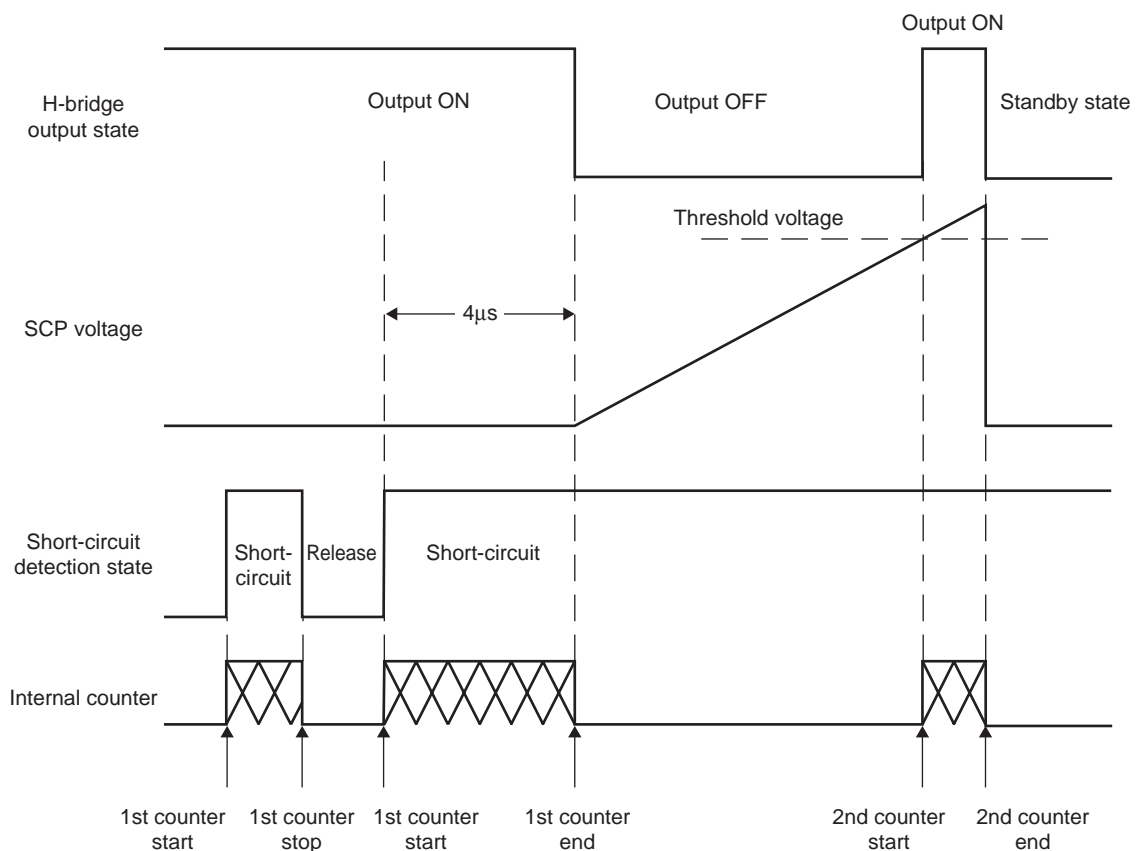

Output short-circuit protection function

The LV8761V incorporates an output short-circuit protection circuit that turns off the output to prevent the IC from fatal damage when the output is short-circuited due to short-to-power or short-to-ground fault. Either the “latch-type,” in which the output off state is latched when the short-circuit protection circuit is activated, or “auto reset-type,” in which the output on/off states are repeated when the short-circuit protection circuit is activated, can be selected.

EMM Pin	Short-circuit Protection Mode
L	Latch type
H	Auto reset type

1. Protection function operation (Latch method)

The short-circuit protection circuit is activated when it detects the output short-circuit state. If the short-circuit state continues for the internally preset period ($\approx 4\mu\text{s}$), the protection circuit turns off the output from which the short-circuit state has been detected. Then it turns the output on again after a lapse of the timer latch time described later. If the short-circuit state is still detected, it changes all the outputs to the standby mode and retains the state. The latched state is released by setting the PS to L.

2. How to set the SCP pin constant (timer latch-up setting)

The user can set the time at which the outputs are turned off when a short-circuit occurs by connecting a capacitor across the SCP and GND pins. The value of the capacitor can be determined by the following formula :

Timer latch-up : T_{ocp}

$$T_{ocp} \approx C \times V/I \text{ [s]}$$

V : Comparator threshold voltage (1V typical)

I : SCP charge current ($5\mu\text{A}$ typical)

When a capacitor with a capacitance of 50pF is connected across the SCP and GND pins, for example, T_{scp} is calculated as follows :

$$T_{scp} = 50\text{pF} \times 1\text{V}/5\mu\text{A} = 10\mu\text{s}$$

3.Auto Reset Type

The sequences up to the detection of an output short-circuit state are identical to those which are explained in Section 1, "Protection Function Operation (Latch Type).

After output is turned off on detection of an output short-circuit condition, the internal counter starts counting and repeats turning on and off the output as shown in the figure below.

This state continues until the overcurrent state is eliminated.

4.Unusual Condition Warning Output Pin (EMOT)

The LV8761V is provided with the EMOT pin which notifies the CPU of an unusual condition if the protection circuit operates by detecting an abnormal condition of the IC. This pin is of the open-drain output type and requires a pull-up resistor when to be used.

The EMOT pin is placed in the ON state when one of the following conditions occurs.

1. Shorting-to-power or shorting-to-ground occurs at the output pin and the output short-circuit protection circuit is activated.
2. The IC junction temperature rises and the thermal protection circuit is activated.

The EMOT pin is set to the OFF state when the relevant protection operation is eliminated.

Application Circuit Example

(When you use the current limit function)

Setting the current limit value

When $V_{CC} = 5V$,

$V_{ref} = 1.5V$

$I_{limit} = V_{ref}/5/R_{NF}$

$= 1.5V/5/0.22\Omega = 1.36A$

Setting the current limit regeneration time and short-circuit detection time

$T_{scp} \approx C \times V/I$

$= 100pF \times 1V/5\mu A$

$= 20\mu s$

LV8761V

(When you do not use the current limit function)

Setting at short-circuit state detection time

$$\begin{aligned}
 T_{SCP} &\approx C \cdot V / I \\
 &= 100\text{pF} \cdot 1\text{V} / 5\mu\text{A} \\
 &= 20\mu\text{s}
 \end{aligned}$$

*Do the following processing when you do not use the current limit function.

- It is short between RNF-GND.
- The terminal VREF is hung on suitable potential of VCC or less.
