

# 670MHz LVDS-to-LVDS and Anything-to-LVDS 1:2 Splitters

## ABSOLUTE MAXIMUM RATINGS

V<sub>CC</sub> to GND .....-0.3V to +4.0V  
 IN+, IN- to GND .....-0.3V to +4.0V  
 OUT<sub>+</sub>, OUT<sub>-</sub> to GND .....-0.3V to +4.0V  
 PD0, PD1 to GND .....-1.4V to (V<sub>CC</sub> + 1.4V)  
 Single-Ended and Differential Output  
 Short-Circuit Duration (OUT<sub>+</sub>, OUT<sub>-</sub>) .....Continuous  
 Continuous Power Dissipation (T<sub>A</sub> = +70°C)  
     10-Pin  $\mu$ MAX (derate 5.6mW/°C above +70°C) .....444mW  
     10-Lead QFN (derate 24.4mW/°C above +70°C) .....1951mW  
 Maximum Junction Temperature .....+150°C

Storage Temperature Range .....-65°C to +150°C  
 ESD Protection  
     Human Body Model (R<sub>D</sub> = 1.5k $\Omega$ , C<sub>S</sub> = 100pF)  
     IN+, IN-, OUT<sub>+</sub>, OUT<sub>-</sub> ..... $\pm$ 2kV  
     Other Pins (V<sub>CC</sub>, PD0, PD1) .....2kV  
     IEC 61000-4-2 Level 4 (R<sub>D</sub> = 330 $\Omega$ , C<sub>S</sub> = 150pF)  
     Contact Discharge IN+, IN-, OUT<sub>+</sub>, OUT<sub>-</sub> ..... $\pm$ 8kV  
     Air-Gap Discharge IN+, IN-, OUT<sub>+</sub>, OUT<sub>-</sub> ..... $\pm$ 15kV  
 Lead Temperature (soldering, 10s) .....+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## DC ELECTRICAL CHARACTERISTICS

(V<sub>CC</sub> = +3.0V to +3.6V, R<sub>L</sub> = 100 $\Omega$   $\pm$ 1%,  $\overline{\text{PD}}_{-}$  = high, differential input voltage |V<sub>ID</sub>| = 0.05V to 1.2V, MAX9174 input common-mode voltage V<sub>CM</sub> = |V<sub>ID</sub>|/2 to (2.4V - |V<sub>ID</sub>|/2), MAX9175 input common-mode voltage V<sub>CM</sub> = |V<sub>ID</sub>|/2 to (V<sub>CC</sub> - |V<sub>ID</sub>|/2), T<sub>A</sub> = -40°C to +85°C, unless otherwise noted. Typical values are at V<sub>CC</sub> = +3.3V, |V<sub>ID</sub>| = 0.2V, V<sub>CM</sub> = +1.25V, T<sub>A</sub> = +25°C.) (Notes 1, 2, 3)

**Note 1:** Current into a pin is defined as positive. Current out of a pin is defined as negative. All voltages are referenced to ground except  $V_{TH}$ ,  $V_{TL}$ ,  $V_{ID}$ ,  $V_{OD}$ , and  $\Delta V_{OD}$ .

**Note 2:** Maximum and minimum limits over temperature are guaranteed by design and characterization. Devices are 100% tested at  $T_A = +25^\circ C$ .

**Note 3:** Tolerance on all external resistors (including figures) is  $\pm 1\%$ .

**Note 4:** Guaranteed by design.

**Note 5:** AC parameters are guaranteed by design and characterization and are not production tested. Limits are set at  $\pm 6$  sigma.

**Note 6:**  $C_L$  includes scope probe and test jig capacitance.

**Note 7:** Pulse-generator output for differential inputs  $IN+$ ,  $IN-$  (unless otherwise noted):  $f = 670MHz$ , 50% duty cycle,  $R_O = 50\Omega$ ,  $t_R = 700ps$ , and  $t_F = 700ps$  (0% to 100%). Pulse-generator output for single-ended inputs  $\overline{PD0}$ ,  $\overline{PD1}$ :  $t_R = t_F = 1.5ns$  ( $0.2V_{CC}$  to  $0.8V_{CC}$ ), 50% duty cycle,  $V_{OH} = V_{CC} + 1.0V$  settling to  $V_{CC}$ ,  $V_{OL} = -1.0V$  settling to zero,  $f = 10kHz$ .

**Note 8:** Pulse-generator output for  $t_{DJ}$ :  $|V_{OD}| = 0.15V$ ,  $V_{OS} = 1.25V$ , data rate 800Mbps,  $2^{23} - 1$  PRBS,  $R_O = 50\Omega$ ,  $t_R = 700ps$ , and  $t_F = 700ps$  (0% to 100%).

**Note 9:**  $t_{SKPP1}$  is the magnitude of the difference of any differential propagation delays between devices operating under identical conditions.

**Note 10:**  $t_{SKPP2}$  is the magnitude of the difference of any differential propagation delays between devices operating over rated conditions.

**Note 11:** Meets all AC specifications.

MAX9174/MAX9175

## Detailed Description

The MAX9174/MAX9175 are 670MHz, low-jitter, low-skew 1:2 splitters ideal for protection switching, loop-back, and clock and signal distribution. The devices feature ultra-low 80ps<sub>p-p</sub> deterministic jitter (max) that ensures reliable operation in high-speed links that are highly sensitive to timing error.

The MAX9174 has a fail-safe LVDS input and LVDS outputs. The MAX9175 has an anything differential input (CML/LVDS/LVPECL) and LVDS outputs. The outputs can be put into high impedance using the power-down inputs. The MAX9174 features a fail-safe circuit that drives the outputs high when the input is open, undriven and shorted, or undriven and terminated. The MAX9175 has a bias circuit that forces the outputs high when the input is open. The power-down inputs are compatible with standard LVTTL/LVCMOS logic.

The power-down inputs tolerate undershoot of -1V and overshoot of V<sub>CC</sub> + 1V. The MAX9174/MAX9175 are available in 10-pin μMAX and 10-lead thin QFN packages, and operate from a single +3.3V supply over the -40°C to +85°C temperature range.

## Current-Mode LVDS Outputs

The LVDS outputs use a current-steering configuration. This approach results in less ground bounce and less output ringing, enhancing noise margin and system speed performance.

A differential output voltage is produced by steering current through the parallel combination of the integrated differential output resistor and transmission line impedance/termination resistor. When driving a 100Ω termination resistor, a differential voltage of 250mV to 475mV is produced. For loads greater than 100Ω, the output voltage is larger, and for loads less than 100Ω, the output voltage is smaller. See the Differential Output Voltage vs. Load Resistance curve in *Typical Operating Characteristics* for more information. The outputs are short-circuit current limited for single-ended and differential shorts.

## MAX9174 Input Fail-Safe

The fail-safe feature of the MAX9174 sets the outputs high when the differential input is:

- Open
- Undriven and shorted
- Undriven and terminated

Without a fail-safe circuit, when the input is undriven, noise at the input may switch the outputs and it may appear to the system that data is being sent. Open or undriven terminated input conditions can occur when a cable is disconnected or cut, or when a driver output is in high impedance. A shorted input can occur because of a cable failure.

# 670MHz LVDS-to-LVDS and Anything-to-LVDS 1:2 Splitters

When the input is driven with a differential signal of  $|V_{ID}| = 50\text{mV}$  to  $1.2\text{V}$  within a voltage range of  $0$  to  $2.4\text{V}$ , the fail-safe circuit is not activated. If the input is open, undriven and shorted, or undriven and terminated, an internal resistor in the fail-safe circuit pulls the input above  $V_{CC} - 0.3\text{V}$ , activating the fail-safe circuit and forcing the outputs high (Figure 1).

## Overshoot and Undershoot Voltage Protection

The MAX9174/MAX9175 are designed to protect the power-down inputs (PD0 and PD1) against latchup due to transient overshoot and undershoot voltage. If the input voltage goes above  $V_{CC}$  or below  $GND$  by up to  $1\text{V}$ , an internal circuit limits input current to  $1.5\text{mA}$ .

## Applications Information

### Power-Supply Bypassing

Bypass the  $V_{CC}$  pin with high-frequency surface-mount ceramic  $0.1\mu\text{F}$  and  $0.001\mu\text{F}$  capacitors in parallel as close to the device as possible, with the smaller valued capacitor closest to  $V_{CC}$ .

### Differential Traces

Input and output trace characteristics affect the performance of the MAX9174/MAX9175. Use controlled-impedance differential traces ( $100\Omega$  typ). To reduce radiated noise and ensure that noise couples as common mode, route the differential input and output signals within a pair close together. Reduce skew by matching the electrical length of the two signal paths that make up the differential pair. Excessive skew can result in a degradation of magnetic field cancellation. Maintain a constant distance between the differential traces to avoid discontinuities in differential impedance. Minimize the number of vias to further prevent impedance discontinuities.

### Cables and Connectors

Interconnect for LVDS typically has a controlled differential impedance of  $100\Omega$ . Use cables and connectors that have matched differential impedance to minimize impedance discontinuities.

Avoid the use of unbalanced cables such as ribbon or simple coaxial cable. Balanced cables such as twisted pair offer superior signal quality and tend to generate less EMI due to magnetic field canceling effects. Balanced cables pick up noise as common mode, which is rejected by the LVDS receiver.

### Termination

The MAX9174/MAX9175 require external input and output termination resistors. For LVDS, connect an input

Table 1. Input Function Table

| INPUT                                  |                                                        | OUTPUTS         |

MAX9174/MAX9175

Figure 2.  $V_{OD}$  Test Circuit

Figure 3.  $V_{OS}$  Test Circuit

Figure 4. Transition Time, Propagation Delay, and Output-to-Output Skew Test Circuit

The MAX9174/MAX9175 feature an integrated differential output resistor. This resistor reduces jitter by damping reflections produced by a mismatch between the transmission line and termination resistor at the far end of the interconnect.

## Board Layout

Separate the differential and single-ended signals to reduce crosstalk. A four-layer printed circuit board with separate layers for power, ground, differential signals, and single-ended logic signals is recommended. Separate the differential signals from the logic signals with power and ground planes for best results.

## IEC 61000-4-2 Level 4 ESD Protection

The IEC 61000-4-2 standard (Figure 9) specifies ESD tolerance for electronic systems. The IEC 61000-4-2 model specifies a 150pF capacitor that is discharged into the device through a 330Ω resistor. The MAX9174/MAX9175 differential inputs and outputs are rated for IEC 61000-4-2 level 4 (±8kV Contact Discharge and ±15kV Air-Gap Discharge). The Human Body Model (HBM, Figure 10) specifies a 100pF capacitor that is discharged into the device through a 1.5kΩ resistor. IEC 61000-4-2 level 4 discharges higher peak current and more energy than the HBM due to the lower series resistance and larger capacitor.

- NOTES:
1. ALL DIMENSIONS ARE IN mm. ANGLES IN DEGREES.
  2. COPLANARITY SHALL NOT EXCEED 0.08 mm.
  3. WARPAGE SHALL NOT EXCEED 0.10 mm.
  4. PACKAGE LENGTH/PACKAGE WIDTH ARE CONSIDERED AS SPECIAL CHARACTERISTIC(S).
  5. DRAWING CONFORMS TO JEDEC MO229, EXCEPT DIMENSIONS "D2" AND "E2".
  6. "N" IS THE TOTAL NUMBER OF LEADS.
